MY REMINISCENCES

BY RABINDRANATH TAGORE.

ALL RIGHTS RESERVED. COPYRIGHTED IN THE UNITED STATES OF AMERICA

(1)

I know not who paints the pictures on memory's canvas ; but whoever he may be, what he is painting are pictures ; by which I mean that he is not there with his brush simply to make a faithful copy of all that is happening. He takes in and leaves out according to his taste. He makes many a big thing small and small thing big. He has no compunction in putting into the background that which was to the fore, or bringing to the front that which was behind. In short he is painting pictures, and not writing history.

Thus, over Life's outward aspect flow the series of events, and within is being painted a set of pictures. The two correspond but are not one.

We do not get the leisure to thoroughly view this studio within us. Portions of it now and then catch our eye, but the greater part remains out of sight in the darkness. Why the ever-busy painter is painting ; when he will have done ; for what gallery his pictures are destined ;—who can tell ?

Some years ago, on being questioned as to the events of my past life, I had occasion to pry into this picture-chamber. I had thought to be content with selecting some few materials for my Life's story. I then discovered, as I opened the door, that Life's memories are not Life's history, but the original work of an unseen Artist. The variegated colours scattered about are not reflections of outside lights, but belong to the painter himself, and come passion-tinged from his heart ; thereby unfitting the record on the canvas for use as evidence in a court of law.

But though the attempt to gather precise history from memory's storehouse may be fruitless, there is a fascination in looking over the pictures, a fascination which casts its spell on me.

The road over which we journey, the wayside shelter in which we sojourn, are not pictures while still travelling—they are too necessary, too obvious. When, however, before turning into the evening rest-house, we look back upon the cities, fields, rivers and hills which we have been through in Life's morning, then, in the light of the passing day, are they pictures indeed. Thus, when my opportunity came, did I look back, and was engrossed.

Was this interest aroused within me solely by a natural affection for my own past ? Some personal feeling, of course, there must have been, but the pictures had also an independent artistic value of their own. There is no event in my reminiscences worthy of being preserved for all time. But the quality of the subject is not the only justification for a record. What one has truly felt, if only it can be made sensible to others, is always of importance to one's fellow men. If pictures which have taken shape in memory can be brought out in words, they are worth a place in literature.

It is as literary material that I offer my memory pictures. To take them as an attempt at autobiography would be a mistake. In such view these reminiscences would appear useless as well as incomplete.

(2) TEACHING BEGINS.

We three boys were being brought up together. Both my companions were two years older than I. When they were placed

under their tutor, my teaching also began, but of what I learnt nothing remains in my memory.

What constantly recurs to me is "The rain patters, the leaf quivers*". I am just come to anchor after crossing the stormy region of the *karq, khalat* series; and I am reading "The rain patters, the leaf quivers", for me the first poem of the Arch Poet. Whenever the joy of that day comes back to me, even now, I realise why rhyme is so needful in poetry. Because of it the words come to an end, and yet end not; the utterance is over, but not its ring; and the ear and the mind can go on and on with their game of tossing the rhyme to each other. Thus did the rain patter and the leaves quiver again and again, the live-long day in my consciousness.

Another episode of this period of my early boyhood is held fast in my mind.

We had an old cashier, Kailash by name, who was like one of the family. He was a great wit, and would be constantly cracking jokes with everybody, old and young; recently married sons-in-law, new comers into the family circle, being his special butts. There was room for the suspicion that his humour had not deserted him even after death. Once my elders were engaged in an attempt to start a postal service with the other world by means of a planchette. At one of the sittings the pencil scrawled out the name of Kailash. He was asked as to the sort of life one led where he was. Not a bit of it, was the reply. "Why should you get so cheap what I had to die to learn?"

This Kailash used to rattle off for my special delectation a doggerel ballad of his own composition. The hero was myself and there was a glowing anticipation of the arrival of a heroine. And as I listened my interest would wax intense at the picture of this world-charming bride illuminating the lap of the future in which she sat enthroned. The list of the jewellery with which she was bedecked from head to foot, and the unheard of splendour of the preparations for the bridal, might have turned older and wiser heads; but what moved the boy, and set wonderful joy pictures flitting before his vision, was the rapid jingle of the frequent rhymes and the swing of the rhythm.

These two literary delights still linger in

my memory - and there is the other, the infants' classic: "The rain falls pit-a-pat, the tide comes up the river."

The next thing I remember is the beginning of my school-life. One day I saw my elder brother, and my sister's son Satya, also a little older than myself, starting off to school, leaving me behind, accounted unfit. I had never before ridden in a carriage nor even been out of the house. So when Satya came back, full of unduly glowing accounts of his adventures on the way, I felt I simply could not stay at home. Our tutor tried to dispel my illusion with sound advice and a resounding slap: "You're crying to go to school now, you'll have to cry a lot more to be let off later on." I have no recollection of the name, features or disposition of this tutor of ours, but the impression of his weighty advice and weightier hand has not yet faded. Never in my life have I heard a truer prophecy.

My crying drove me prematurely into the Oriental Seminary. What I learnt there I have no idea, but one of its methods of punishment I still bear in mind. The boy who was unable to repeat his lessons was made to stand on a bench with arms extended, and on his upturned palms were piled a number of slates. It is for psychologists to debate how far this method is likely to conduce to a better receptivity of mind. I thus began my schooling at an extremely tender age.

My initiation into literature had its origin, at the same time, in the books which were in vogue in the servants' quarters. Chief among these were a Bengali translation of Chanakya's aphorisms, and the Ramayana of Krittivasa.

A picture of one day's reading of the Ramayana comes clearly back to me.

The day was a cloudy one. I was playing about in the long verandah* overlooking the road. All of a sudden Satya, for some reason I do not remember, wanted to frighten me by shouting, "Policeman! Policeman!" My ideas of the duties of policemen were of an extremely vague description. One thing I was certain about, that a person charged with crime once placed in a policeman's hands would, as

* Roofed colonade or balcony. The writer's family house is an irregular three-storied mass of buildings, which had grown with the joint family it sheltered, built round several courtyards or quadrangles, with long colonades along the outer faces, and narrower galleries running round each quadrangle, giving access to the single rows of rooms.

* A jingling sentence in the Bengali Chhiti's Primer.

† Exercises in two-syllables.

sure as the wretch caught in a crocodile's serrated grip, go under and be seen no more. Not knowing how an innocent boy could escape this relentless penal code, I bolted towards the inner apartments, with shudders running down my back for blind fear of pursuing policemen. I broke to my mother the news of my impending doom, but it did not seem to disturb her much. However, not deeming it safe to venture out again, I sat down on the sill of my mother's door to read the dog-eared *Ramayana*, with a marbled paper cover, which belonged to her old aunt. Alongside stretched the verandah running round the four sides of the open inner quadrangle, on which had fallen the faint afternoon glow of the clouded sky, and finding me weeping over one of its sorrowful situations my great-aunt came and took away the book from me.

(3) WITHIN AND WITHOUT.

Luxury was a thing almost unknown in the days of our infancy. The standard of living was then, as a whole, much more simple than it is now. Apart from that, the children of our household were entirely free from the fuss of being too much looked after. The fact is that, while the process of looking after may be an occasional treat for the guardians, to the children it is always an unmitigated nuisance.

We used to be under the rule of the servants. To save themselves trouble they had almost suppressed our right of free movement. But the freedom of not being petted made up even for the harshness of this bondage, for our minds were left clear of the toils of constant coddling, pampering and dressing-up.

Our food had nothing to do with delicacies. A list of our articles of clothing would only invite the modern boy's scorn. On no pretext did we wear socks or shoes till we had passed our tenth year. In the cold weather a second cotton tunic over the first one sufficed. I never entered our heads to consider ourselves ill-off for that reason. It was only when old Niyamat, the tailor, would forget to put a pocket into one of our tunics that we complained, for no boy has yet been born so poor as not to have the wherewithal to stuff his pockets; nor, by a merciful dispensation of providence, is there much difference between the wealth of boys of rich or poor parentage. We used to have a pair of slip-

pers each, but not always where we had our feet. Our habit of kicking the slippers on ahead, and catching them up again, made them work none the less hard, through effectually defeating at every step the reason of their being.

Our elders were in every way at a great distance from us, in their dress and food, living and doing, conversation and amusement. We caught glimpses of these, but they were beyond our reach. Elders have become cheap to modern children; they are too readily accessible, and so are all objects of desire. Nothing ever came so easily to us. Many a trivial thing was for us a rarity, and we lived mostly in the hope of attaining, when we were old enough, the things which the distant future held in trust for us. The result was that what little we did get we enjoyed to the utmost; from skin to core nothing was thrown away. The modern child of a well-to-do family nibbles at only half the things he gets; the greater part of his world is wasted on him.

Our days were spent in the servants' quarters in the south-east corner of the outer apartments. One of our servants was Shyam, a dark chubby boy with curly locks, hailing from the District of Khulna. He would put me into a selected spot and, tracing a chalk line all round, warn me with solemn face and uplifted finger of the perils of transgressing this ring. Whether the threatened danger was material or spiritual I never fully understood, but a great fear used to possess me. I had read in the *Ramayana* of the tribulations of Sita for having left the ring drawn by Lakshman, so it was not possible for me to be sceptical of its potency.

Just below the window of this room was a tank* with a flight of masonry steps leading down into the water; on its west bank, along the garden wall, an immense banyan tree; to the south a fringe of cocoanut palms. Ringed round as I was near this window I would spend the whole day peering through the drawn venetian shutters, gazing and gazing on this scene as on a picture book. From early morning our neighbours would drop in one by one to have their bath. I knew the time for each one to arrive. I was familiar with the peculiarities of each one's toilet. One would stop up his ears with his fingers as he took

* An artificial pond usually oblong in shape.

his regulation 'number of dips, after which he would depart. Another would not venture on a complete immersion but be content with only squeezing his wet towel repeatedly over his head. A third would carefully drive the 'surface impurities away from him with a rapid play of his arms, and then on a sudden impulse take his plunge. There was one who jumped in from the top steps without 'any preliminaries' at all. Another would walk slowly in, step by step, muttering his morning prayers the while. One was always in a hurry, hastening home as soon as he was through with his dip. Another was in no sort of hurry at all, taking his bath leisurely, followed with a good rub-down, and a change from wet bathing clothes into clean ones, including a careful adjustment of the folds of his waist cloth, ending with a turn or two in the outer garden, and the gathering of flowers, with which he would finally saunter slowly homewards, radiating the cool comfort of his refreshed body, as he went. This would go on till it was past noon. Then would the bathing places be deserted and become silent. Only the ducks remaining, paddling about after water snails, or busy preening their feathers, the livelong day.

When solitude thus reigned over the water, my whole attention would be drawn to the shadows under the banyan tree. Some of its aerial roots, creeping down along its trunk, had formed a dark complication of coils at its base. It seemed as if into this mysterious region the laws of the universe had not found entrance; as if some old-world dream-land had escaped the divine vigilance and lingered on into the light of modern day. Whom I used to see there, and what those beings did, it is not possible to express in intelligible language. It was about this Banyan tree that I wrote later:

With tangled roots hanging down from
your branches, O ancient banyan tree,
You stand still day and night, like an
ascetic at his penances,
Do you ever remember the child whose
fancy played with your shadows?

Alas! that banyan tree is no more, nor the piece of water which served to mirror the majestic forest-lord! Many of those who used to bathe there have also followed into oblivion the shade of the banyan tree.

* The men's portion of the house is the outer, and the women's the inner.

And that boy, grown older, is counting the alternations of light and darkness which penetrate the complexities with which the roots he has thrown off on all sides have encircled him.

Going out of the house was forbidden to us, in fact we had not even the freedom of all its parts. We perforce took our peeps at nature from behind the barriers. Beyond my reach there was this limitless thing called the Outside, of which flashes and sounds and scents used to momentarily come and touch me through its interstices. It seemed to want to play with me through the bars with so many gestures. But it was free and I was bound—there was no way of meeting. So the attraction was all the stronger. The chalk line has been wiped away today, but the confining ring is still there. The distant is just as distant, the outside is still beyond me; and I am reminded of the poem I wrote when I was older:

The tame bird was in a cage, the free bird was in the forest.

They met when the time came, it was a decree of fate.

The free bird cries, "O my love, let us fly to wood."

The cage bird whispers, "Come hither, let us both live in the cage."

Says the free bird, "Among bars, where is there room to spread one's wings?"

"Alas," cries the cage bird, "I should not know where to sit perched in the sky."

The parapets of our terraced roofs were higher than my head. When I had grown taller; when the tyranny of the servants had relaxed; when, with the coming of a newly married bride into the house, I had achieved some recognition as a companion of her leisure, then did I sometimes come up to the terrace in the middle of the day. By that time everybody in the house would have finished their meal; there would be an interval in the business of the household; over the inner apartments would rest the quiet of the mid-day siesta; the wet bathing clothes would be hanging over the parapets to dry; the crows would be picking at the leavings thrown on the refuse heap at the corner of the yard; in the solitude of that interval the caged bird would, through the gaps in the parapet, commune bill to bill with the free bird!

I would stand and gaze.....My glance first falls on the row of cocoanut trees on the further edge of our inner garden.

SIR RAHINDRANATH TAGORE'S ANCESTRAL HOUSE.

Through these are seen the 'Singhi's Garden' with its cluster of huts* and tank, and on the edge of the tank the dairy of our milkwoman, Tara; still further on, mixed up with the tree-tops, the various shapes and different heights of the terraced roofs of Calcutta, flashing back the blazing whiteness of the midday sun, stretch right away into the grayish blue of the eastern horizon. And from some of these far distant dwellings stand forth their roofed stairways leading upto the terrace, as if with uplifted finger and a wink they are hinting to me of the mysteries of their interiors. Like the beggar at the palace door who imagines impossible treasures to be held in the strong rooms closed to him, I can hardly tell of the wealth of play and freedom which these unknown dwellings seem to me crowded with. From the furthest depth of the sky full of burning sunshine overhead the thin shrill cry of a kite reaches my ear; and from the lane adjoining Singhi's Garden, comes up, past the houses silent in their noonday slumber, the sing-song of the bangle-seller—*chai choori chai*...and my whole being would fly away off the work-a-day world.

My father hardly ever stayed at home, he was constantly roaming about. His rooms on the third storey used to remain shut up. I would pass my hands through the venetian shutters, and thus opening the latch get the door open, and spend the afternoon lying motionless on his sofa at the south end. First of all it was a room always closed, and then there was the stolen entry, this gave it a deep flavour of mystery; further the broad empty expanse of terrace to the south, glowing in the rays of the sun would set me day-dreaming.

There was yet another attraction. The waterworks had just been started in Calcutta, and in the first exuberance of its triumphant entry it did not stint even the Indian quarters of their supply. In that golden age of pipe water, it used to flow even upto my father's third storey rooms. And turning on the shower tap I would indulge to my heart's content in an untimely bath. Not so much for the comfort of it, as to give rein to my desire to do just as I fancied. The alternation of the joy of liberty, and the fear of being caught,

made that shower of municipal water send arrows of delight thrilling into me.

It was perhaps because the possibility of contact with the outside was so remote that the joy of it came to me so much more readily. When material is in profusion, the mind gets lazy and leaves everything to it, forgetting that for a successful feast of joy its internal equipment counts for more than the external. This is the chief lesson which his infant state has to teach to man. There his possessions are few and trivial, yet he needs no more for his happiness. The world of play is spoilt for the unfortunate youngster who is burdened with an unlimited quantity of playthings.

To call our inner garden a garden is to say a deal too much. Its properties consisted of a citron tree, a couple of plum trees of different varieties, and a row of cocoanut trees. In the centre was a paved circle the cracks of which various grasses and weeds had invaded and planted in them their victorious standards. Only those flowering plants which refused to die of neglect continued to uncomplainingly perform their respective duties without casting any aspersions on the gardener. In the northern corner was a rice-husking shed, where the inmates of the inner apartments would occasionally foregather when household necessity demanded. This last vestige of rural life has since owned defeat and slunk away ashamed and unnoticed.

None the less I suspect that Adam's garden of Eden could hardly have been better adorned than this one of ours; for he and his paradise were alike naked; they needed not to be furnished with material things. It is only since his tasting of the fruit of the tree of knowledge, and till he can fully digest it, that man's need for external furniture and embellishment is persistently growing. Our inner garden was my paradise; it was enough for me. I well remember how in the early autumn dawn I would run there as soon as I was awake. A scent of dewy grass and foliage would rush to meet me, and the morning with its cool fresh sunlight would peep out at me over the top of the Eastern garden wall from below the trembling tassels of the cocoanut palms.

There is another piece of vacant land to the north of the house which to this day we call the *golabari* (barn house). The name shows that in some remote past this must have been the place where the year's

* These Bustees or settlements consisting of tumble-down hovels, existing side by side with palatial buildings, are still one of the anomalies of Calcutta. T.

store of grain used to be kept in a barn. Then, as with brother and sister in infancy, the likeness between town and country was visible all over. Now the family resemblance can hardly be traced. This *gokhari* would be my holiday haunt if I got the chance. It would hardly be correct to say that I went there to play—it was the place not play, which drew me. Why this was so, is difficult to tell. Perhaps its being a deserted bit of waste land lying in an out-of-the-way corner gave it its charm for me. It was entirely outside the living quarters and bore no stamp of usefulness; moreover it was as unadorned as it was useless, for no one had ever planted anything there; it was doubtless for these reasons that this desert spot offered no resistance to the free play of the boy's imagination. Whenever I got any loop-hole to evade the vigilance of my warders and could contrive to reach the *golabari* I felt I had a holiday indeed.

There was yet another place in our house which I have even yet not succeeded in finding out. A little girl playmate of my own age called this the "King's palace." "I have just been there", she would sometimes tell me. But somehow the propitious moment never turned up when she could take me along with her. That was a wonderful place, and its playthings were as wonderful as the games that were played there. It seems to me it must be somewhere very near—perhaps in the first or second storey—the only thing was one never seemed to be able to get there. How often have I asked my companion, "Only tell me, is it really inside the house or outside?" And she would always reply, "No, no, it's in this very house." I would sit and wonder: "Where then can it be? Don't I know all the rooms of the house?" Who the king might be I never cared to inquire; where his palace is still remains undiscovered; this much was clear—the king's palace was within our house.

Looking back on childhood's days the thing that recurs most often is the mystery which used to fill both life and world. Something undreamt of was lurking everywhere and the uppermost question everyday was: when, Oh! when would we come across it? It was as if nature held something in her closed hands and was smilingly asking us: "What d'you think I have?" What was

impossible for her to have was the thing we had no idea of.

Well do I remember the custard apple seed which I had planted and kept in a corner of the south verandah, and used to water every day. The thought that the seed might possibly grow into a tree kept me in a great state of fluttering wonder. Custard apple seeds still have the habit of sprouting, but no longer to the accompaniment of that feeling of wonder. The fault is not in the custard apple but in the mind. We had once stolen some rocks from an elder cousin's rockery and started a little rockery of our own. The plants which we sowed in its interstices were cared for so excessively that it was only because of their vegetable nature that they managed to put up with it till their untimely death. Words cannot recount the endless joy and wonder which this miniature mountain-top held for us. We had no doubt that this creation of ours would be a wonderful thing to our elders also. The day that we sought to put this to the proof, however, the hillock in the corner of our room, with all its rocks, and all its vegetation, vanished. The knowledge that the schoolroom floor was not a proper foundation for the erection of a mountain was imparted so rudely, and with such suddenness, that it gave us a considerable shock. The weight of stone of which the floor was relieved settled on our minds when we realised the gulf between our fancies and the will of our elders.

How intimately did the life of the world throb for us in those days! Earth, water, foliage and sky, they all spoke to us and would not be disregarded. How often were we struck by the poignant regret that we could only see the upper storey of the earth and knew nothing of its inner storey. All our planning was as to how we could pry beneath its dust-colored cover. If, thought we, we could drive in bamboo after bamboo, one over the other, we might perhaps get into some sort of touch with its inmost depths.

During the *Mugh* festival a series of wooden pillars used to be planted round the outer courtyard for supporting the chandeliers. Digging holes for these would begin on the first of *Mugh*. The preparations for festivity are ever interesting to young folk. But this digging had a special

attraction for me. Though I had watched it done year after year—and seen the hole grow bigger and bigger till the digger had completely disappeared inside, and yet nothing extraordinary, nothing worthy of the quest of prince or knight, had ever appeared—yet, every time I had the feeling of the lid being lifted off a chest of mystery. I felt that a little bit more digging would do it. Year after year passed, but that bit never got done. There was a pull at the curtain but it was not drawn. The elders, thought I, can do whatever they please, why do they rest content with such shallow delving? If we young folk had the ordering of it, the inmost mystery of the earth would no longer be allowed to remain smothered in its dust covering.

And the thought that behind every part of the vault of blue reposed the mysteries

of the sky would also spur our imaginings. When our Pundit, in illustration of some lesson in our Bengali science primer, told us that the blue sphere was not an enclosure, how thunderstruck we were! "Put ladder upon ladder," said he, "and go on mounting away, but you will never bump your head." He must be sparing of his ladders, I opined, and questioned with a rising inflection, "And what if we put more ladders, and more, and more?" When I realised that it was fruitless multiplying ladders I remained dumbfounded pondering over the matter. Surely, I concluded, such an astounding piece of news must be known only to those who are the world's schoolmasters!

(To be continued.)

SURENDRANATH TAGORE.

RAJGIR OR RAJAGRIHA.

MRS. MABEL HOLMWOOD.

RAJAGRIHA is the most interesting place known to us of ancient Magadha, after Bodh Gaya and Gaya. Pataliputra is at present but a name and its excavation is only now commencing. Raja

griha is a valley of ruins, but the hills localize interest and we are able to trace the positions of the old cities and of many of the sites connected with the stories handed down by the Buddhist writers. The history of the hills goes back into the dim distance of the days recorded in the Mahabharata. We can imagine Krishna arriving there with the two Pandavas, the divine Arjuna (fabled as son of the god Indra) and that strongest of princes, Bhima, all ready to wreak their vengeance on the king of Magadha. In later days when the Buddha came with his message of good will to all men, the mountain city was still the capital of Magadha and Bimbisara of the Saisunaga dynasty was then its ruler. His son, Ajatasatru, built the "new city" of Rajagriha and made it his capital.* It is now in absolute ruins, even the inner walls can hardly be traced. It lay just outside, on the north of the hills, while in the valley which they encircled was the old city commonly known as old Rajagriha. Hwen Thsang calls it "Kusagarapura," the city of the lucky grass, and describes it as "the palace city" as well as "the mountain stronghold." The name,

HINDU KUNDS BELOW VAIBHARA, RAJGIR.

"Girivraja," (the "mountain-girt" city) is the earliest found in its history, when it was the impregnable fortress of Jarasandha of the Danava race, the great king of Magadha.* The Mahabharata gives a long account of his conquests over neighbouring kings, and refers to his wickedness in making human sacrifices of his captives to Siva. Yudhishthira, the eldest of the Pandavas, being desirous of showing his power as a Chakravartin monarch, is told

that he will never be able to fulfil the Rajasuya sacrifice while Jarasandha lives. Krishna, the prince of Dwarka† and Arjuna and Bhima, two of the Pandava brothers, go to Girivraja, and with the object of killing Jarasandha challenge him to mortal combat. Jarasandha after placing his son on his throne, chooses Bhima as his opponent. The struggle was long, they wrestled—

"these tigers among men, these heroes of great prowess, with their bare arms their only weapons, cheerfully engaged in the encounter each desirous of vanquishing the other. And seizing each other's arms and twining each others legs, they slapped their armpits causing the enclosure to tremble at the sound...they grasped and struck each other like two mad elephants encountering each other with their trunks... and the sound the wrestlers made by the slapping of their arms, the seizing of each other's necks for bringing each other down...became so loud that it resembled

* "The bull of the Danavas...became that bull among men noted as Jarasandha"—Mahabharata, Adi Parva, LXVII. Dr. B. Spooner in J. R. As. S. B., July 1915, considers "Danava" equivalent to "Persian". He traces Danava as a synonym of Dasyavah, the Sanskrit form of "Danghavo" (the only name used by Zoroastrians of themselves) which Manu used to describe the peoples of Behar, Bengal and Orissa as well as the Kambojas, the Paradas and the Pahlavas, all of whom are recognised as of Persian origin. This would explain the enmity between Jarasandha and the Aryans of Northern India as well as the contemptuous allusions to Magadha and its people even before the growth and success of Buddhism produced friction. Dr. Haug in "Language Writings and Religion of the Parsis," p. 279 4th Ed. writes "The name Danava is given, both in the Vedas and the Zend-Avesta, to enemies with whom war is to be waged." Compare Yr. V. 73 and Atharvaveda, IV. 24-2. In the Rigveda it is often the name of the archdemon Vritra, with whom Indra is fighting."

† Krishna is represented as related to some of the captive kings. He was accepted as a partial incarnation of Vishnu and his brother, Balarama, as an epiphany of Sesha, the serpent (also part of him). Their sister was Subhadra; and the three are now worshipped in the Jagannath triad at Puri. They appear as a protest against Buddhism and the Buddhist triad whose worship in Kalinga (which includes Orissa) they superseded. Arjuna, the special friend of Krishna and bravest of the Pandava Brothers, was said to be an incarnation of Indra, while Bhima was of Vayu, the god of the wind.

THE OLD WALLS ON SONAGIRI, RAJGIR.

the roar of thunder or of falling cliffs. Both of them were foremost of mighty men and both took great delight in such encounter."

Bhima conquered, and their historic fight on the Raambhumi (fighting ground) outside the city walls is remembered to this day. In fact the spot is still pointed out where this great wrestling match is supposed to have taken place. The site comprises a considerable area that had evidently been carefully levelled and prepared with a special kind of fine white earth; and wrestlers from different parts of India may still be seen at times taking away supplies of this fine earth, which they use to rub over their bodies before wrestling. They believe it contains some special virtue to give additional strength and aid from the magic of the name of the strongest of the Pandava brothers, Bhima.

Not the least interesting part of the Mahabharata story is the description of the city "full of cheerful and well-fed inhabitants belonging to all the four orders, where the festivities were perennial." The shops had "every kind of wealth that man desires." There were "handsome houses," and we can realize them from those depicted on

* Mahabharata. Sabha Parva, XXIII. It gives quite a "scientific" account of the wrestling which must have been a highly developed art even then.

the oldest basreliefs at Barhut and Sanchi and from the entrance facades of some of the great caves. The lower story was built up strongly in clay or stone, while above rose wooden verandahs and turrets elaborately designed. Wood was used alike in palace and hovel. Probably the more important buildings were made partly of stone, as great mounds of prepared stones are found and we know that the most skilful use was made of stone in the fortification walls, many of which can still be seen on the hills. That wood played the most important part in the construction of the city buildings is evident from the account Hwen Thsang gives of Bimbisara's self-inflicted banishment. The houses of the people were so close together that "when one house was in flames, it was impossible to prevent the whole neighbourhood from sharing in the calamity and consequently the whole was burnt up. Then the people made loud complaints and could not rest quietly in their dwellings." The king, on the advice of his ministers, to make the people more careful, passed a law exiling to the forest north of the hills those in whose dwelling a fire should originate. His own palace was the next to be burned, so to uphold his law he retired to the forest, leaving his son

photograph

offman.

THE PIPPALA STONE-HOUSE FROM THE SOUTH, RAJGIR

to reign in his place.* There would be great difficulty now in obtaining wood for buildings, but in those days Hwen Thsang says the roads were bordered with Kanaka trees†, giving a delicious perfume, and the forests in the spring were all golden in colour. In the Mahabharata, too, we read the hills were covered with forests of Lodhra‡ and Pippala. It goes on to say the valley was "full of flocks and herds, its stock of water never exhausted." To-day, of all this prosperity nothing remains but dense undergrowth and short thick scrub, among which masses of stone mark the

sites of old buildings and temples and the outlines of the city's inner walls. Still its

The Hills and five hills encircle the deserted valley "like the walls of a city" as Pa-Hian describes them.

"Vaibhara, Varaha, Vrishabha, Rishigiri and the delightful Chaitya all high peaks and over-grown with tall trees...seem jointly to protect the city of Girivraja" are the words of Krishna in the Mahabharata*. Considering them as peaks rather than distinct mountains these are easily traced as Vaibhara-giri, Vipula-giri, Ratna-giri, Uday-giri and Sona-giri †. For about 25 miles along these hills run the outer circumvallation of the immense ancient fortifications, joined where necessary across the plains by high bandhs (embankments). "The Jarasandha bandh" joins Vaibhara and Sonagiri on the west. About a quarter of a mile east of this, another bandh leaves the foot of Vaibhara and joins the inner wall.

* Hwen Thsang gives Bimbisara's retirement to the forest as the reason for calling the site Rajagriha or the king's house. Beal. B. Rec. II. 166. History accepts the fact of the murder of Bimbisara by his son Ajatasatru.

† *Pterospermum acerifolium*, or Kanak-champa, Katha-champa, is planted for ornament, the leaves are used for plates and tobacco packing, the flowers as a disinfectant. Watts. Dic. Econ. P.

‡ *Symplocos racemosa* a small tree found in dry forest, on lower hills and plains. The bark is used medicinally and in dyeing. It gives a yellow colour, and is much prized as producing good red shades. Watts. Dic. Econ. Products.

* Mahabharata, Sabha Parva, XXI. In Pali annals the hills are called, Webhara, Wepulo, Isigili, Gijji-kuta, and Pandawo.

MUKDUM KUND FROM THE NORTH, RAJGIR.

of the city. One runs from Ratnagiri across to Udayagiri, while joined to it is the wall from the Gr̥hrakuta hill which comes down to the Nakve or Nakpai embankment. The inner walls have a radius of about four miles. The outer fortification walls to the south are specially well preserved. Here the Banganga stream leaves the valley in a narrow defile, only a few feet wide, between Sonagiri and Udayagiri making a picturesque contrast with the old forts and mighty walls of ancient days. These two hills have an easy ascent, and hence were so strongly fortified. On both, the massive stone walls climb up the hill-sides attaining even now 17 feet in width and 12 in height, strengthened by solid bastions at intervals. Steps on the inner side are built into the walls to give access to the summit. The walls are made of an outer casing of large stones, some nearly 5 feet long, carefully fitted without cement, and filled in with smaller stones. These walls are probably the oldest stone work extant in India.

“The very fact that these walls have weathered so many centuries and are still in such a wonderful state of preservation

in places speaks well for the builders of those days of long ago.

When Krishna and his friends, disguised as “Snataka Brahmins”^{*} came to Jarasandha's capital, they did not enter by the gates but pierced with their arrows and with “their mighty arms . . . broke down the Chaityaka peak” which was the glory and pride of the Magadhas, worshipped alike by king and people, where were kept the three great drums of Vrihadratha, whose sound when struck resounded for a month.[†] This act of defiance announced to the king, they came as foes, claimed no hospitality and accepted nothing in his city. The king demands their reason for coming by an “improper gate.” Krishna explains that the vow of the Snataka Brahmana may be taken by Brahmins, Kshattriyas, and Vaisyas. “These are the rules of the ordinance, namely, that an enemy's abode should be entered by a wrong gate and a friend's by a

OLD FORTIFICATION WALLS ON UDAYAGIRI & BANGANGA PASS, RAJGIR.

right gate."* Thus they held themselves free from all blame of treachery. What the Chaitya peak represents and where it was is impossible to say. At the north and south gates the fortifications were too strong to be evaded. The heroes came from the north-west. "They crossed the Ganges and the Sone and went towards the east."† Hwen Tshang tells us that the city "on the west . . . is approached through a narrow pass." The rocky offshoot of Mount Vaibhara, commonly called Chhata or Chakra according to Mr. Broadley, is only separated from Sonagiri by a narrow ravine and may possibly be "the proper gate," referred to by the incensed king. On the east is another Chhata-giri, the hill identified by Mr. Broadley as the sacred Gridhrakuta peak of the Buddhist annals. It is a high and rugged peak, not easily accessible from the outer (northern) side of the hills. Still there may have been

a tradition of sanctity still haunting it when the Buddha chose it for his favourite abode. Viharas and stupas arose on all the hills but this hill is specially associated with the Buddha himself. The ancient folklore of the land was preserved by the Magadhas and Sutas, the chanters of the deeds and legends of the kings and national heroes of the land as well as of the praise of the gods.* Thus it may well be that by degrees celestial honours were given to the popular favorites. To discover the human element underlying this mass of legend and myth is a truly fascinating study, but the result can never be regarded as altogether reliable. Here we have an actually existent geographical foundation in the hills of Rajagriha; and tradition is an obstinate guardian of many forgotten truths.

Of all spots among these hills the Gridhrakuta peak appeals most to Buddhists. There the Tathagata spent most of his time towards the end of his ministry, and preached many sutras. The Mahayanists say the •Saddharma Pundarika and the

JAIN TEMPLES AT NANAN KUND, RAJGIR.

Prajna Paramita were both delivered here, where the Buddha ever resides : "it is only an illusion when men imagine they have seen him in other places."* The hill has been easy to identify from descriptions handed down to us of its appearance and position, "touching the southern slope of the northern mountain, it rises as a solitary peak to a great height," "long from east to west and narrow from north to south."† But most decisive of all was Mr. Broadley's discovery of the actual roadway King Bimbisara is said to have made from the city up the mountain side to enable him to go and hear the Buddha preach. The two stupas he erected on the route were also found as described, one where the king dismounted and walked called the "Dismounting from the chariot" ; the other where the people following were ordered to return called "sending back the crowd". On the west-

ern face of the mountain there was a vihara where the Buddha preached ; and close by, where he walked up and down, is said to lie the stone that Devadatta threw at him. South of the vihara was the stone house where the Buddha had entered Samadhi in a previous birth, and where Ananda alarmed by Mara was re-assured by the Buddha who passed his hand through the wall and patted him on the head. Traces have been found of all these structures, corroborating the accounts of the Chinese pilgrims.* The ruins of a

Sonagiri large Sangharama and Vihara, where now a Jain temple stands, on the top of Sonagiri, are now identified as probably marking the place to which the Emperor Asoka retired in his old age, and thus another great name is added to the interesting story of these hills. Dr. Fleet traces from the last recension of the edicts the history of the last days of the Great Monarch. After the 37th year of his reign, the 255th year having expired since the death of the Buddha, Asoka having placed his grandson on the throne retired to

Suvarnagiri (Sonagiri),* where he spent the next 256 nights in worship. The edict repeats "nights spent in worship two hundred and fifty-six 256", this gives a night of worship for every year since the Parinirvana.†

Almost in the centre of the plain between Maniyar Math. Sonagiri and Vaibhara, within the wall of the old city, was an ancient tumulus on which a small and neglected Jain temple stood which was known as the Maniyar Math. Mr. Broadley found by its side fragments of brick and granite pillars and the pieces of a cornice, covered with "Buddhas and Nagas." Later Dr. Bloch excavated the tumulus finding at its base stucco images mostly figures, six with snake hoods, one

which he thinks is meant for the Banasura whose hands were cut off by Krishna, also a dancing Siva, a Ganesha and a garlanded linga. This connection of the worship of Siva, Vishnu and the Nagas is specially interesting, because in the Mahabharata Krishna points out to his companions where "dwelt of old those Nagas Aruvuda and Shakravapin as also the Naga Swastika and that other excellent Naga Mani." It may be in honour of the latter that the site received the name of Maniyar. An old tale of buried wealth is told, and might connect the worship here with "Manibhadra, the king of the Yakshas,"* as well as with the Nagas who are gurdians of treasure, and protectors from drought. "Manu had himself ordered the kingdom of

* Suvarna and Sona both mean "gold."

† See J. R. A. S. of Gt. B. 1911, XXXII.

SUPPOSED SIGHT OF WRESTLING GROUND, RAJGIR.

the Magadhas never to be afflicted with drought."*

The Mahabharata not only tells us of Krishna's connection with the mountain stronghold but of the worship of Siva established there. It records that Jarasandha kept his 86 captive kings waiting till he obtained 100, "in the temple of Siva, devoted unto that god and offered as sacrifice unto him like so many animals.....as soon as he obtaineth those fourteen, he will begin his cruel act."

Not only does the epic tell us that Vishnu and Siva (Siva-Girika, the mountain Lord) were worshipped in Girivraja but that the fetishism of earlier days continued in snake worship and the festival in honour of the Rakshasi Jara, the dynastic Grihadevi of Vrihadratha's race.†

* Mahabharata, Sabha Parva, XXI.

† The marvel of Jarasandha's birth is told in

About one mile S.W. from the hot springs, at the foot of the Sonbhandar cave, southern slope of the Vaibhara hill, the cave known as the Sonbhandar is found. At first this cave was identified with the Sattapanni hall, the large "stone house" which was shown to Hwen Thsang as the place where the first Buddhist Council was said to have met. The cave is 33 ft. long, by 17 ft. wide and 16 ft. high. Inside there is a stone stupa

Sabha Parva, XVIII. Vrihadratha desirous of offspring obtained from a Muni a magic mango. Each of the king's wives ate half the fruit, each bore half the child. The two parts were joined by the Rakshasi Jara. She describes herself as "created by the Self-Created and named Grihadevi." Hence came the name bestowed on the child "Jara sandha", "united by Jara", and the festival instituted in her honor. J. F. Hewitt explains the myth as symbolizing the union of the Magadhas, Kushikas and Gotamas under one king. See Ruling Races, pp. 21, 75, 146, 431.

with four sides each carved with a standing figure on a lotus, below which are a pair of animals and the wheel. They are presumably the Dhyanī Buddhas, each with his own chihna, or emblem, and attendants. Dr. Bloch considers that the inscription by the door of the 3rd or 4th century A. D. shows that the cave was made by Muni Vairadeva for the Jains. It says he "made two caves for the images of the Arhats." A roughly drawn figure by the side of the inscription is presumably meant, therefore, for a Tirthankara.

The Sattapanni has been more successfully located by Dr. Bloch at the floor of the northern face of the Sattapanni Hall. Vaibhara about a mile from

Karanda-Venuvana on a small low spur of the hill. Here are definite remains of a large platform and the foundations of a wall of huge unhewn blocks similar to those used in the Pippala stone house, giving evidence of a large ruined structural building.

The Vaibhara and Vipula hills form the northern rampart of the valley. Here the inner gates are indicated by the line of the city walls, about 160 feet south-east of the meeting of the two streams which pass out through the defile between the hills. Both streams are called Sarasvati, the one coming from Ratnagiri and the other from the south-west of Vaibhara. * The gates of the outer fortifications were 250 feet further north. † It appears from what remains exist that they were protected by massive walls and bastions. By following the Chinese pilgrim's measurements from the northern gates of "the mountain-girt city" we may trace sites of interests outside the limit of the hills.

Of "New Rajagriha" little can be seen except the outline of the inner ramparts, which average 14 feet in thickness. Between it and the hills lay the Karanda-Venuvana, the bamboo woods and gardens presented to the Sangha by Karanda, and a Vihara. All that now remains is a mound of debris surmounted by a Muhammadan tomb. Dr. Bloch dug some trial trenches in the mound but only a few small miniature clay stupas were found. The Karanda-hrada (tank) was north of the Vihara, and there Mr. Broadley found an image with an inscription of dedi-

cation to the tank. The old Smasana (burning ground) was probably, where the present burning ghat is. Of the two stupas the pilgrims mention, one is possibly the mound at the foot of Vaibhara and the other that at the foot of Vipula, now surmounted with a temple of Mahadeva.

On the banks of the Sarasvati are the celebrated hot springs, 7 or 8 at the foot of Vaibhara and 5 under Vipula near Makhdum Shah's Hujra. † A largely attended fair, known as the "Lawan Mela," is held at the hot springs every three years, i. e., in the Hindu leap year when an extra or intercalary month (called "lawan" or "mala mas") is added to make the lunar year keep pace with the solar year. Some Hindu temples have been constructed near the hot springs but these are of no special interest.

Above the kunds are two large platforms built up of huge stones. Dr. Bloch thought these were the watch towers of the northern entrance and formed part of the fortifications. The upper one is called "Sitamarhi." About 800 feet lower on the hill side, and some 270 feet above the Markanda kund, is the other platform. It is about 28 feet in height forming a rough square of 70 to 80 feet. It is commonly

* Broadly, Bihar in Patna, p. 36.

† The Brahmakund is the principal of the hot springs below Vaibhara. Others are the Ananda-Rikhi, Markande, Vyas and the Ganga-Jamuna nearest the hill. The latter has carved stone stools for the spring water as described by Hwen Tshang, "carved stones sometimes shaped like lions, and at other times as the heads of white elephants, while below there are stone basins in which the water collects like ponds. Here people of every region come and from every city, to bathe." The temperature of the Satdhara-kund is about 105 degrees Fahr. Seven streams enter from the western side, and at the southern end is a small cave temple with modern images of the 7 Rishis. The last kund is the Kashi-tirth through which the waters of the spring pass into the Sarasvati. Further north is a Pakka ghat on both sides of the Sarasvati, where "gau-dan and pinda-dan are performed by the pilgrims. At the foot of Vipulagiri are also hot and cold springs, called Nana-kund, Sita-kund, Soma-kund, Ganesha-kund and Rama-kund. About a quarter of a mile further on, in an enclosure, is a celebrated well called Sringgi-rikhi-kund by Hindus and Makhdum-kund by Muhammadans and equally prized by both. A flight of about 80 steps lead up to the stone cell known as the "hujra" of Makhdum Shah Shaikh Sharf-uddin Ahmad, a great Muhammadan saint specially revered in Bihar. It was the scene of his 40 days' meditation and fast. The platform above it, is where his morning and evening prayers were said." (Broadley, Bihar in Patna.)

* Broadley, Bihar in Patna, 28.

† A. S. I. 1905-1906 "Rajgir."

known as "Jarasandh-ka-Baithak." Local legend tells how in a single day Jarasandha built this and the broad stone roadway which goes right over the hill (probably the foundations of the old fortification walls), to assemble his troops on the hill tops in defence of Girivraja against his enemies from the west. In the lower part of the platform are several small cells, and a cave has been found behind it.* This platform is specially interesting as it has been identified with the "Pippala stone-house" described by Hwen Tshang as west of the hot springs, where the Tathagata stayed in the heat of the day. The deep cavern which is behind the walls of this house is the palace abode of an Asura.† There are three Muhammadan tombs on the top of the platform, one of which is thought by some to be that of Kamdar Khan Mayi, one of the most important Muhammadan chiefs in South Bihar during the first half of the 18th century, whose warlike achievements are still the theme of many a local ballad.

The Buddhist day has passed, but dim memories of the great Sage still haunt these hills. It is not to the Muhammadans or the Hindus, though each claim a sacred place in Rajgir, but to the Jains that the heritage of the hills has come. It is their shrines we see to-day shining white on each crest and spur. To them Rajgir ranks with Parasnath and Pawapuri. The latter village is not far off, on the banks of the Panchana river, south of the town of Bihar. Here Mahavira Vardhamana, their greatest and last Jina (conqueror saint) died. Large numbers of Jain pilgrims come to all three places from every part of India and their subscriptions keep the shrines in good repair. These shrines, however, are all comparatively modern and have been built mostly with materials taken from older temples and stupas. Carved fragments and pillars are used freely in their construction, and Buddhist statues are often found in them. Every shrine contains the "charana paduka" of a Tirthankara. On Vaibhara there is a Jain shrine below the Pippala stone house. Above on the hill are six or more temples. One dedicated to the 15th and 16th Tirthankaras, Dharmanatha and Shantinatha, is interest-

ing from the tradition connecting it with that of the Maniyar Math. Mr. Broadley says it contains two images and a charana with an inscription about 200 years old. The pujari (temple priest) has corrupted the names to Dhanaji and Sathadraji and describes them as two wealthy bankers who lived in the house at the Nirmal kund, i. e., the house that stood on the mound in the south-east corner of the ancient city. This is identified with the mound on which stands "the Maniyar Math." Mr. Broadley was also told that it was in honour of these two wealthy bankers, Dhanaji and Sathadraji, that the Math was built. A little to the north of this on Vaibhara Mr. Broadley found among the ruined Buddhist shrines one that he describes as "the most perfect building of its kind." The cupola had fallen and there was no image of the Buddha left, but one had been carved in the centre of the lintel of the entrance doorway. Above the stupa mound on which the Mahadeva temple stands on a spur of Vipula, are two Jain temples, one of which is dedicated to the great Mahavira. On the summit of Vipula are extensive Buddhist remains as well as a platform about 130 feet long, 30 wide and 6 feet above the rocks made of the materials from the Buddhist mounds including 30 pillars. On this stand four modern Jain temples with fine pieces of Buddhistic carvings inset. There are also two fine slabs, one of the Navagraha (nine planets) and another of the Das Avatar (Vishnu's ten incarnations). From the top of this hill, the view from which is very fine, one can cross to Ratnagiri by a rocky defile. Here is another temple in which some carved pillars have been used. Udayagiri has also debris of Buddhist buildings, and now five Jain temples crown it, each with its Buddha statue engraved with the Buddhist formula "Ye dharma hetu" etc. Over the ruins of the Vihara on Sonagiri is also a Jain shrine. So all the hills are claimed for the Buddha's greatest rival, and only the Gridhrakuta is left. Buddhist pilgrims might well take steps to raise a rest-house there for those who, like Fa-Hian, would pass the night and meditate. "Here it was in by-gone days Buddha dwelt. . . Fa-Hian, not privileged to be born when Buddha lived, can but gaze on the traces of his presence and the place which he occupied."

THE COST OF ADMINISTRATION IN INDIA, JAPAN, AND THE UNITED STATES OF AMERICA

BY LALA LAJPAT RAI.

IT is admitted by all competent observers that India is one of the poorest countries in the world; the average income of an Indian being only 2 pounds a year (10 dollars of American money and 20 Yen of Japanese) according to the official estimate made in Lord Curzon's time. A comparison of the salaries paid to the Indian administrators with those paid to men in similar positions in Great Britain, the United States of America and Japan will show that the Indian administration is the most costly in the world.

Before we quote the actual figures we would like to point out that although the exchange value of the Indian Rupee is equal to 33 cents of American money and about 66 sens of the Japanese money, (i.e. the American dollar is equal to Rs. 3 and the Japanese Yen equal to Rs. 1½), the economic value of the rupee, judged from the prices of necessities of life and from the wages of labour, is about equal to that of the American dollar and the Japanese Yen. It is a fact which I know from my personal experience. The purchasing value of the Rupee has gone down much of late, but still it is as good as that of a dollar in America and a yen in Japan.

CENTRAL GOVERNMENT.

The President of the United States of America, who ranks with the great royalties of the world in position, gets a salary of 75,000 dollars without any other allowance. The Prime Minister of Japan gets 12,000 yen. The Viceroy and Governor-General of India gets Rs. 2,50,800 besides a very large amount in the shape of allowances. The Cabinet Ministers of the United States get a salary of 12,000 dollars each, that of Japan, 8,000 yen, and the Members of the Viceroy's Council 80,000 Rs. each.

In the whole Federal Government of the United States there are only 3 offices which

carry a salary of more than 8,000 dollars a year. They are given below:—

The President of the General Navy Board	... 13,500
Solicitor General	... 10,000
Assistant Solicitor General	... 9,000

All the other salaries range from 2,100 to 8,000 dollars. In the State Department all offices, including those of the secretaries, carry salaries of 2,100 to 5,000 dollars. In the Treasury Department the Treasurer gets 8,000, and 3 other officers get 6,000 each. All the remaining get from 2,500 to 5,000 dollars. In the War Department there are only two offices which have a salary of 8,000 each attached to them, viz., that of Chief of Staff and of Quarter Master General. The rest get from 2,000 to 6,000. In the Navy Department, besides the president of the General Board mentioned above, the President of the Naval Examination Board gets 8,000 and so does the Commandant of the Marine Corps. All the rest get from 6,000 downwards. In the Department of Agriculture there is only one office carrying a salary of 6,000. All the rest, from 5,000 downwards. The Chief of the Weather Bureau (an expert) gets 6000. In the commerce Department 4 experts get 6000 each, the rest from 5000 downwards. These are annual salaries.

In Japan the officials of the Imperial Household have salaries ranging from 5500 to 8000 yen, officials of the Higher Civil Service from 3700 to 4200 a year, Vice-Ministers of State 5000, chief of the Legislative Bureau 5000, the Chief Secretary of the Cabinet 5000, the Inspector General of Metropolitan Police 5000.

President of the Board of Audit	... 6000
President of the Administrative Litigation Court	... 6000
President of the Railway Board	... 7500
President Privy Council	... 6000
Vice-President of the Privy Council	... 5500
and so on. All the salaries are per annum.	

INDIA.

President of the Railway Board gets 60,000 or 72,000 Rs.

Two Members of the Railway Board ... 48,000 each

Secretaries in the Army, Public Works and Legislative Departments ... 42,000 each

Secretaries in Finance, Foreign, Home, Revenue and Agriculture and Commerce and Industry Departments ... 48,000

Secretary in the Education Department ... 36,000

(The Chief Commissioner of Education in the United States gets only ... 5,000 Dollars).

Joint Secretary ... 30,000

Controller and Auditor General ... 42,000

Accountants General from ... 27,000 to 33,000

Commissioner of Salt Revenue ... 30,000

Director General of Post and Telegraph from ... 36,000 to 42,000

(In the United States the Post Master General is a Cabinet Minister and gets 12,000 Dollars). Post Masters General from 18,000 to 24,000.

Among the officers directly under the Government of India there are only a few who get salaries below Rs. 20000, most of the others get from Rs. 20400 to 36000. The fact that the population of the United States of America consists of people of all races from the world and that there is a constant flow of immigration makes the work of administration very difficult and complex; otherwise also the administrative problems handled by the United States administration are even more complex and difficult than those faced by the administration in India.

PROVINCIAL ADMINISTRATIONS.

The United States Government have under it 54 States, some of which are as big in area, if not bigger, as the several provinces of India. The Governors of these States are paid from 2500 dollars a year upto 12000 dollars a year. There is only one State, that of Illinois, which pays 12000 to its Governor, five others, amongst them California and New York, pay 10000; only two, Massachusetts and Indiana,

pay 8000 and only one pays 7000; 3 pay 6000; the rest all 5000 or less. There is only one territory under the United States Government, viz., that of the Phillipines, which pays a salary of 20000 to its Governor General. In India the Governors of Madras, Bombay and Bengal, each receive 120000 Rupees per year besides large amounts for allowances. Lieutenant Governors receive Rs. 100000 each besides allowances. The Chief Commissioner receives 62000 in Assam, 62000 in Central Provinces, and Berar, 36000 in Delhi, and so on. The Political Residents in the Native States receive from 33000 to 48000 besides allowances. In Japan the Governors of Provinces are paid at the rate of, from 3700 to 4500 yens, per year besides allowances varying from 400 to 600 yen per year. The provincial services in India are paid on a similarly lavish scale. In Bengal the salaries range from 4800 Rs. a year allowed to an Assistant Magistrate and Collector to Rs. 64000 allowed to members of council, and the same may be said of the other provinces also. Coming to the judiciary we find that the Judges of the Supreme Court of the United States get a salary of 14,500 dollars each, the Chief Justice getting 15,000; the circuit judges get a salary of 7000 dollars each, the District Judges \$ 6000 each. In the States of New York, the Judges of the Supreme Court belonging to the General Sessions get 17500 each and those of the Special Sessions get from 9000 to 10000 each, City Magistrates get a salary of 7000 to 8000 each. In India the Chief Justice of Bengal gets 72000, the Chief Justices of the Bombay, Madras and the United Provinces get 60000 each. The Chief Judges of the Chief Courts of the Punjab and Burmah get 48000 each and the Puisne Judges of the High Courts the same amount, the Puisne Judges of the Chief Courts getting 42000. In the Province of Bengal the salaries of the District and Sessions Judges range from 24000 to 36000 a year. The salaries of the District Judges in the other major provinces range from 20000 to 36000 and so on. The Deputy Commissioners in India get a salary according to different scales in different provinces varying from 18000 to 27000 a year; the Commissioners getting from 30000 to 36000 a year. In Japan the Appeal Court Judges and Procurators get salaries varying from 1200 to 5000 yen per year. Only one officer

that of the President of the Court of Cassation getting 6000. The District Court Judges and Procurators are paid at the rate of 750 to 3700 yen per year.

It is needless to compare the salaries of the minor offices in the three countries. The fact that the Indian taxpayer has to pay so heavily for the European Services engaged in the work of administration makes it necessary that even the Indian officers should be paid on a comparatively high scale, thus raising the cost of administration to the highest pitch and telling very injuriously on the condition of the men in the lowest grades of the Government service. The difference between the salaries of the officers and the men forming the rank and file of the Government offices in the three countries mentioned above shows how the ordinary Government servant in the lowest rank in India suffers from the fact that the officers have to be paid at such high rates. We will illustrate what we mean.

THE POLICE.

Police Force of New York City. The Chief Inspector gets \$3500 a year, Captains \$2750 each, Lieutenants \$2250, Sergeants 1750, Patrol men, corresponding to our Constables, 1400 each. The Commissioner of Police gets \$7500. In Japan the Inspector General of the Metropolitan Police gets 5000 yen. The figures for the lower offices are not available but the minimum salary of a constable, is 13 yen per month, besides which he gets his equipment, uniform and boots, &c., free. In India the Inspectors General get from 24000 to 36000, Deputy Inspectors General from 18000 to 21600, District Superintendents of Police from 8000 to 14400, Assistants from 3600 to 6000, Inspectors from 1800 to 3000, Sub-Inspectors from 600 to 1200, Head Constables from 180 to 240, Constables from Rs. 120 to 144 per year. We have taken these figures from the Indian Year Book published by the Times of India Office, Bombay. We know as a fact that the Police Constables in the Punjab are paid from 8 to 10 rupees a month, that is, from 96 to 120 rupees a year. The reader would mark the difference between grades of salaries from the highest to the lowest in India as compared with the United States and Japan. While in India the lowest grade servants are frightfully underpaid, the highest grade

officers are paid on a lavish scale. In the other countries of the world this is not the case.

Educational Department. In the United States (we quote the figures of the New York City) the lowest school teachers get a salary of 720 dollars a year rising to 1500. In the upper grades the maximum salaries are 1820 to 2260. *Principals of Elementary Schools* receive 3500 and Assistants 2500. In High Schools salaries range from 900 to 3150 dollars. In Training Schools from 1000 to 3250 dollars. Principals of High Schools and Training Schools are paid 5000 dollars and the same salary is paid to the District Superintendents. The salary of the Commissioner of Education in New York is 7500 dollars. In Japan the Minister of Education, who is a Cabinet Minister, gets a salary of 8000 yen per year and the lowest salary of a teacher ranges from 16 yen to 18 yen per month. In the United States the highest salaries allowed to College Professors are from 5000 to 7000 dollars a year. In Japan they range from 600 to about 4000 yen per year. Coming to India we find that while the administrative officers and even the Professors get fairly high salaries, the teachers in the schools are miserably underpaid. We do not believe there is a single country in the world where the difference between the remunerations allowed to the highest and the lowest of the state servants is so disproportionate as in India, yet there is a tendency to still further increase the salaries of the high officials, European and Indian, while even very insignificant increases to the salaries of the lowest servants of the State are very grudgingly allowed. Then the high officials get so many kinds of allowances that sometimes the amount of those allowances equals their salaries, which is not the case in the case of the lower grade servants. The fact is that the Government in India does not attach sufficient importance to the ordinary man. His needs are often overlooked in the desire to please the higher services and to keep them contented. Considering that every man in India is supposed to have a family, the condition of the lowest official is extremely miserable and justifies corruption in their ranks. The Government of India must know it, yet they have not done anything to remedy this state of things. A rise in the prices is claimed to be a good ground for raising the salaries of the highly paid

civilians, but the same weight is not attached to it when the question of a rise in the salaries in the lower grades arises. In the latter case the unfeeling argument of the market rate is freely applied, and it is argued that it will be unbusinesslike for

Government to pay more for services which can be secured cheaper.

The figures relating to military services in India are not available but we know that the above remarks have as much force in the case of military services as in that of the civil.

CO-OPERATIVE CREDIT AND TACCARI

THE taccari and co-operative credit are two systems that are working side by side in the United Provinces, and possibly in other provinces as well. The two modes of helping a poor tenant are radically different in their scope, and differ again in essentials from private banking as between a tenant and the village money-lender. The taccari is the rural banking enterprise conducted by the Government, its collection has all the force, and not unoften the rigour, of a state creditor. The advance, though made in the presence of highly responsible officers, is inevitably linked with the petty *amla*—the Patwari, the Kanungo and a host of clerks, a class of public servants that unfortunately has not a very clean record to show. The collection is associated with more corruption, as it is the business of petty officials in outlying places. Taccari has the advantage of low interest, a little more than six per cent. per annum being the rate. The one predominating feature of this system, however, is that whatever the rate of interest, it enriches the state, it means a substantial addition to the resources of the state, the profit being the difference between the rate of interest the Government can borrow at and that charged from the tenant. The taccari presupposes that in fiscal matters the foreign government in its bureaucratic form is strictly national, that the profits of the state represent the increasing national stock from which the tenant will borrow with increased facility. Taccari is rigid, mechanical and inelastic.

The co-operative credit system is strictly the people's concern under the guiding care of the government. The profits are entirely separate from state revenues, they swell the common wealth, and are free from corrupting influences. It is a national enterprise

as apart from state activity, and its success is measured by the amount of enterprise put forth by the people. The rate of interest is comparatively high, being about 12 p.c., and therein lies the chief handicap as against the easier taccari. It cannot compete with the taccari on the score of interest, it covers only an insignificant ground for want of capital. It is a new plant involving co-operation in a land where combination in business was an unknown feature, and where individual action comprised the whole national activity. The loan is safe-guarded with good security, widening the operation of its liability on a group of persons, and as such is as rigid and unailing as the taccari. So far as human calculations go, and even beyond them, the "bad debt" is an unknown element in both the systems, taccari and co-operative credit. Not only the actual borrower pays but failing him the so many sureties are liable for the debt.

The village money-lender recalls many bitter memories. If the vast mass of official literature represents any truth, he was the author of a lot of agricultural misery in the land, the one functionary who did more to undermine the agricultural prosperity than did the annual settlements of the alien trading company and the unsettlement of many agricultural interests. Such an evil system could no longer hold its own against the taccari and co-operative credit; but the fact that it survives calls for an analysis of the system. The village loan is for the most part a mere wild speculation, a gamble depending on the moral sense of the debtor and the freaks of nature, the rains. The tenants have no ownership in land and they have no better security to offer than the prospects of a good harvest. The rate of interest is exorbitant, but the

forces of time are bringing it down. Every village usurer, however uncompromising, has to write off bad debts. He may play Shylock at times, but he is at the mercy of his debtors, he is amenable to the voice of the village elders, and his life and business depend on a fair spirit of tolerance and fair-play, as morality goes in the villages. How many exacting village money-lenders have had the bitter experience of having their houses broken into at night and the petty hoards of a life-time despoiled by angry debtors in a moment. But a creditor who does not transgress all bounds of fairplay, who is not guilty of flagrant dishonesty and who is not dead to all sense of compromise, need not fear such consequences whatever his usury. The village Panchayat, though bereft of its time-honoured functions and no longer a self-contained republic and a tribunal invested with great executive and judicial powers, has yet some voice left. It is a common experience in the villages to see a debt of several hundred rupees discharged for a couple of cows only at the instance of the Panchayat, if the debtor be really in narrow circumstances. If the Sahukar defies the common verdict of the village elders, he has no chance of better success in a court of law, he loses all moral support.

Money-lending in a village does not prosper for any length of time. If it did, an usury at 25 p. c. compound interest would soon result in big hoards, in palatial houses with marble floors. But the money-lender remains a man of ordinary means, himself in a less struggling condition than the debtor. His earnings are spent in the village, fructify agriculture and increase the common stock. The current practice of land taxation in the provinces does not leave a sufficient margin to increase the source of national wealth, and the tenant and his village banker have no chance of making a hoard.

There can be no question that co-operative credit is the best system suited to agricultural operations, if sufficient funds are forthcoming to meet the requirements of a big rural population as one finds in a district. The needs of tenants find a very imperfect recognition; and the rules prescribing hard limits to the maximum credit leave no room to carry out improvements on the co-operative credit system, which should be more prospective like private banking. The really needy tenant, having

no well or canal to irrigate his fields in a year of severe drought, has to beg, borrow of a village banker or go on starvation wages to a relief work. The taccavi and co-operative credit both leave him in the cold. For all that, the co-operative system is the best. Its great competitor is the taccavi, the State banking. A co-operative concern has little chance to prosper against the organised cheap finances of the State. Is it advisable to run two parallel systems, the one going counter to the other? If the co-operative system is a thing that need be fostered, if cheap capital to the tenant be a necessity, one would think that taccavi were better merged into co-operative credit. The normal credit of Government is $3\frac{1}{2}$ p. c., and so long as private money is shy to come forth in sufficient quantity, Government may advance funds to the credit societies at reasonable interest.

State monopoly, of whatever description comes in conflict with the free business of a people. State landlordism is a verity in most of the provinces in India, it is no mere academical sentiment. Government claims all unearned increment in land. If prices of foodstuffs go up, if world forces improve the value of land, that is considered a very reasonable ground to claim more revenues and rents. Canals are very paying concerns and are a source of direct profit to the state. Water rates just enough to cover the initial costs and expenses of upkeep of a canal, are a real aid to agriculture, any profit over and above this is a tax on land. There are authentic records to show that the old Indian land policy held the State responsible to keep the reservoirs and canals in good repairs within reasonable limits, and this was a practice that continued down to a hundred years back. The modern big irrigation schemes could not be kept up without a special tax, but that would not justify commercial gains. Describing the decay of many sources of income, Mr. Romesh Dutt has observed :

"In going over this list of the principal trade and professions of India, a hundred years ago, one sees how greatly these sources of income have been narrowed within this period. Weaving and spinning are practically dead, as most of the thread and cloth used by the people are supplied by Lancashire. Paper manufacture has also declined; skins are now sent to Europe for all the better kinds of leather work. The dyes of the country have been replaced by aniline dyes. The Beparies and their pack-bullocks have become things of the past, and the profits of carrying trade are now earned, not by boatmen

but by railways owned by foreign capitalists. Agriculture has become virtually the sole means of subsistence for the people with the loss of their many trades and industries."

The fear is that taccavi, though now a sporadic palliative movement of no very great import, bids fair to develop into an

all-powerful rural State Credit before which the co-operative credit or private enterprise will have little chance. It may become a monopoly to further cripple the rural resources.

KRISHNADAS.

INDIAN INDUSTRIES AND THE WAR

ALWAYS conscious of great shortcomings in the matter of industries, and not a little resentful of the political conditions that contribute their share to those shortcomings, India would often make a spasmodic effort to clutch at the good things that other more happily placed countries enjoy. The European war, paralysing for the moment the gigantic manufacturing capacity of Europe, has given fresh impetus to the demand in India for the creation of new industries and manufactures. Speaking rationally, war is a passing distemper, in spite of what gigantic proportions it may have assumed for the time; and the world may not be surprised to hear one morning that the belligerent countries had readjusted their little differences. The machinery of trade and manufacture will resume its wonted grinding with all the force of a pent-up activity and with all the self-interest that the wasteful war could dictate. Preservation or regeneration of Indian industries forms no side issue of the war; rather with the settling of the European differences, the countries of Europe will at least aim all the more at grasping the world trade. German militarism is as aggressive as German commercialism; and British navalism rightly earned the title of "shopkeepers" to the British people, and secured for them the domination over the sea centuries ago. India, now the home of Free Trade, what chance has she to withstand the onrushing avalanche of European trade?

It would appear that India in her industrial dotage has lost the sense of true perspective in industrial matters. Button-making is said at one time to be able to retrieve the economic fortunes of this vast country. The manufacture of matches on

a commercial scale is often held out as a very potent economic remedy. Boot laces are said to be able to add materially to the national wealth. Every small article of foreign import, however insignificant its annual value, now forms a subject of dissertation in the columns of newspapers, as if the fate of the country hung on their successful manufacture. Good things in themselves, but what place do they occupy among the big articles of import—cloth, sugar, metals? The steady import of cloth has drowned the once shrill cry of Swadeshim—preference for home manufacture. The drain on this head alone amounts to over 40 crores a year. The foreign textile import has been veritably built on the ashes of the once flourishing industry in the country. Imported sugar has borne down the native sugar in spite of the religious qualms of a conservative people. This absorbs another 15 crores a year, and the trade has an expanding prospect before it. The younger generation living in large towns do not know what peculiarly appetising flavour the Indian sugar has, the marble white tasteless foreign stuff is so satisfying to the eye, if not to the palate. Iron, metals and machinery account for crores; and a host of minor things, none of which is too trifling to be sedulously produced in India, come to a very colossal amount indeed.

It may be assumed for all practical purposes that for decades to come the present trade and fiscal policy of Britain towards her great dependency may not undergo any material change; that the angle of vision so far as trade interests are concerned may remain constant, whatever administrative reforms may take place here and there. It therefore seems to be a waste of energy to

ask the authorities to set up our industries with their active co-operation. In regard to a few articles which are the exclusive exports of countries other than Great Britain, the Indian Government, with their limited authority in these matters, may take courage to satisfy the Indian sentiment. But is the proposal feasible as regards cotton piecegoods or any other article the manufacture of which is an important source of income to the British Isles or the colonies? The Indian politician knows this, and that is why he asks the Government to help his countrymen in the making of glass, paper, matches, buttons and the like, and why he silently ignores the more serious question of the cotton and the sugar industry. War often helps to shift over the centre of gravity of great industries, but the country that is really benefited the most is the one that can do something even in peace time. What is our peace record?

In a poor country like India, the victim of western aggressive commercialism, it is expected of statesmen and politicians that they would devote at least as much energy to the building up of her lost industries as to the reforms in administration. But if the truth were told, the Indian patriots seriously identified themselves with economic and trade matters only for the brief space of the Bengal Partition days. And leaving aside the question of the Partition, their achievement in the other sphere was solid and tangible indeed. By creating a love for home manufactures, they did as great a service as by unsettling "the settled fact." But where is that spirit now? It can not be supposed that the undoing of the Bengal Partition was a compromise, a bribe to give up the higher service of the country—a ceaseless propaganda to simplify the taste of the nation, to prefer a coarse homespun to the delicate foreign stuff. It is all very well to say that a sentimental war cannot be carried on against organised economic forces, and to some extent the contention is not groundless. But what can justify the reversion to the old apathy, the assumption of the role of a mere advocate as distinct from that of the pilot? Boycott may be bad, all violence applied to economics or politics is reprehensible; but where is any propaganda in the mildest form, a mere educative persuasion ceaselessly carried on in towns, villages and hamlets?

Much has been done of late years in the way of building up the weaving and spinning industries. Ahmedabad has become the Indian Lancashire on a smaller scale, and stray mills are found scattered all over the country. The home demand for the product of these mills, however, has not kept pace with the expansion of manufacture, and it is the Far Eastern countries, in the main, that are helping the mills to keep up a precarious existence. With the first touch of adverse circumstances, the mills close down, as some of the very big mills did at Bombay of late, or work at a reduced strength. Granting that the mills are labouring under the unjust excise duty and that fine fabrics to suit the altered fastidious taste of these people are hard to be made here, much can be done by informed sentiment persistently kept awake. Had it not been for the peasantry of Northern India who have the practical sense to give preference to coarse and long-wearing cloths, the weaving mill industry in India would have made no headway. The leaders of public opinion in India can do much if they do not leave the industrial development of the country to run its sluggish course on mere economic lines. Even the slight fiscal reforms, short of heavy protective duties as Great Britain adopted early in the nineteenth century to exclude Indian manufactures by imposition of duties as heavy as 75 p.c., will not do much, though they will be an undoubted help. The abolition of excise duty on cotton manufactures will lead to some expansion of the trade, but it will be nothing to what a systematic constitutional propaganda may do in a few years. The effects of the Swadeshi movement, though that movement was short-lived, will outlive long years. It may be difficult to take a full stock of practical work done by that economic movement, but life-long votaries to home manufactures, converts to peaceful boycott of foreign articles, will be counted by millions, not so many perhaps in Bengal as in other provinces where the "great wrong" was not actually committed. But the uninformed, ignorant mass of the people have drifted away to an utter indifference. To them home manufacture and foreign manufacture mean the same thing, they are victims to the taste of the moment. But good intelligent people as they are, they await a vigorous informing propaganda to create a taste for home-made stuffs. Pend-

ing the organisation of large capital and mills, the coarse and rude Indian manufacture can fairly meet their requirements.

Nobody would deprecate the systematic building up of industries on sound economic lines and to compete with foreign trade on a purely economic basis. Indian capital is already flowing in, steadily increasing measure to the rearing up of several industries, and if the measure is at all stinted, a regular propaganda can alone stimulate it. Until a complete financial and fiscal autonomy is obtained by the Indian Government, it may be difficult to give any definite assurance to the Indian capitalist. He has to fight against organised cheap capital and expert knowledge of the West, and there is nothing to protect his nascent industries. He will invest according to his opportunity and his personal whim. That he invests at all against such odds is an evidence of his enterprise. That enterprise is nothing in proportion to this vast country and the grave interests involved, but it is something to be thankful for. What is required under the limited circumstances is the pushing on of home manufacture irrespective of their quality, and in some cases of price. State bounty of the West must take the form of national bounty in India, and reasonable profits should be assured to the manufacturer and artisan at a slight cost to the general consumer.

One hoped that the exploded myth that India is the home of agriculture alone and that manufacture and industry are exotics that find no congenial soil here, was a thing of the past. But we find that respon-

sible administrators in high quarters still cling to the view. Sir James Meston is the latest exponent, if not advocate, of agriculture against industry in India. The least one would say is that if manufacture does not find a congenial home in India now, the uncongeniality began with the advent of European trade, and that for a long time the sturdy plant of Indian industry successfully withstood the withering winds of the foreign trading company. Was it not India that supplied to Britain and other countries for centuries the fine cotton and silk fabrics, sugar and many other articles? What India is specially suited for and what not we had better leave to time and opportunity alone to diagnose; the experts may rest assured that their opinion is not valuable in the now fast moving East. It is a wonder how the expert opinion which should have a scientific basis and liable to little change, has undergone a complete change during half a century. The following extract from a General Minute of 30th November, 1830, of Sir John Malcolm shows what the expert opinion on the capability of India as a possible field of industrial activity was;

"It is only by encouraging richer produce...and other articles besides grain, reviving commerce,..... that we can give heart to the country, and enable it to pay its revenue. There is no want either of talent or spirit among the native population subject to our rule and control to accomplish this object, but it requires to be drawn forth; and to effect this it is necessary to exert all the activity, energy and enlarged policy of a government which understands how to combine its own prosperity with that of the community subject to its authority."

NARAIN DAS.

SNAKE-WORSHIP IN EASTERN BENGAL, AND WESTERN AND SOUTHERN INDIA.

ALTHOUGH there is no unimpeachable evidence of the prevalence of snake-worship in the time of the composition of the *Rig-Veda*, scholars have detected traces of its existence in a prayer which is contained in the 8th Ashtaka of this most ancient collection of Indian hymns and

wherein the earth is addressed as the *Sarpa-rajini* or "the queen of the serpents or the queen of all that moves." The *Aitareya Brahmana* also refers to this *Sarpa-mantra*. But it is in the *Taittiriya* or the *Black Yajur-Veda* that we catch a distinct glimpse of the prevalence of snake-

worship in those far-off times. For it embodies a goodlier number of prayers to serpents and a more definite account of serpent-worship than the Rig-Veda. In the *Samhita* of this Veda are to be found prayers to the *Sarpas* who are addressed as denizens of the heavens, the skies, the rays of the sun, the waters, the vegetables, &c. In the *Brahmanas* of this part of the *Yajur-Veda*, invocations are addressed to the said serpents, and sweet sacrifices are offered for their acceptance. The same work describes a battle between the gods and the giants, in the course of which the former are represented as offering curds and barleyflour to the *Sarpas* and the *Sarpa-devatas* and praying for their assistance in the subjugation of their cousins—the giants. Then we come to the *Sutras* or Aphorisms. In the *Grihya-Sutra* of Asvalayana, we find definite instructions laid down for offering sacrifices and making offerings to the *Sarpa-devas* or serpent-gods. The holding of *Sarpa-halis* or serpent-sacrifices is distinctly prescribed, and the ritual is set forth fully. The *Nagas* are also mentioned by Asvalayana.

Then we come to the Christian Era, about the beginning of the second century of which, or somewhat earlier, the *Institutes of Manu* was, according to Dr. G. Buhler, composed. We find that Manu—the ancient law-giver of the Hindus—also makes mention of the *Nagas* and the *Sarpas*.

The *Mahabharata* also mentions the *Nagas* and the *Sarpas*, as is also done by the *Bhagavadgita* wherein Krishna tells Arjuna that Vasuki and Ananta represent him amongst the *Sarpas* and the *Nagas* respectively.

The *Puranas* also mention the *Nagas* and the *Sarpas*. In the *Bhagavata Purana*, Vasuki and eleven other *Nagas* are mentioned as forming the string of the sun's chariot, one serpent being held to be sacred to each month. The *Markandeya Purana* embodies the well-known story of the marriage of Madalasa, a *Naga* princess of superb beauty, with King Kulvalasva.*

Then proceeding onwards through the

earlier centuries of the Christian Era, we arrive in the fifth century A. D. wherein we come across more authentic evidence of the prevalence of snake-worship in the post-Vedic ages of Ancient India. This evidence is afforded by the apologue of *The Gold-giving Serpent* which is the fifth fable of the *Panchatantra*.

The gist of this apologue is to the effect that, once upon a time, a Brahman farmer named Haridatta, getting despondent over the unproductiveness of his field, was taking his mid-day siesta, under the shadow of a tree. All of a sudden, seeing a great hooded snake creeping out of an anthill, he thought to himself: "Surely, this snake is the tutelary deity of my field, and yet I have never worshipped it. That's the reason why my field yields me a very poor return. I will go forthwith and worship it with libations of milk in a bowl." No sooner did he make up his mind to do this than he went to the anthill and offered the snake his propitiatory offering of milk. Next day he found a gold denar in the bowl of milk, and, every day, he received it after offering the libation. This shows that here we have the clearest evidence of the prevalence of snake-worship in Ancient India during the earlier centuries of the Christian Era. Although analogues of this fable exist in Phædrus and Babrius, Benfey has proved most ingeniously and conclusively (*Eindl.* 1.359) that this Indian apologue is the source of both the Greek and the Latin fables. This being so, we must now determine the probable date of the composition of the *Panchatantra* wherein this apologue occurs. It is now well-known to Indologists that this work existed in the first half of the sixth century A.D., inasmuch as it was translated, under the order of King Khosru Anushirvan (531-579 A.D.) into Pchlevi, the then literary language of Persia. Professor A. Macdonell, therefore, assumes that "it was known in the fifth century, for a considerable time must have elapsed before it became so famous that a foreign king desired its translation."* We are, therefore, in a position to come to the definite conclusion that the snake was worshipped in India prior to the sixth century A.D.

* For a fuller discussion of the evidence bearing on the prevalence of snake-worship in the Vedic and Puranika periods of Ancient India, vide Rao Sahib Vishvanath Narayan Mandlik's paper on "Serpent Worship in Western India" in the *Journal of the Bombay Branch of the Royal Asiatic Society*, Vol. IX, Pp. 188-193.

* *A History of Sanskrit Literature.* By R. A. Macdonell M. A., Ph. D. London: W. Heinemann, 1900. pp. 369 ff.

Since then, the worship of the snake, either in its living form or in the shape of an image like the brazen serpent which Moses set up in the wilderness, has continued in India till the present day. We occasionally catch glimpses of its prevalence in Mediæval India, for that celebrated French traveller and pioneer of French trade with India—Jean Baptiste Tavernier, in the course of his visit to this country in the seventeenth century, saw the serpent worshipped in the form of an idol. He says:—

"While the men (Manaris) load their animals in the morning and the women fold up their tents, the priests who follow them elevate, in the most beautiful parts of the plain where they are encamped, an idol in the form of a serpent, entwined about a staff of six or seven feet in height, and each one in file goes to make reverence to it, the girls turning round it three times. After all have passed, the priests take care to remove the idol and to load it on an ox allocated for that purpose." *

Then again :

"At the March full moon there is a solemn festival for the idol which has the form of a serpent, of which I have spoken in the first Book of this account of India. This festival lasts nine days, and while it lasts both men and beasts remain idle; the majority of the latter are ornamented with circles of vermillion around the eyes, with which the horns are also painted, and, when there is any special love for the animal, leaves of tinsel are added. Each morning the idol is worshipped, the girls dancing round it for an hour to the sound of flutes and drums, after which all eat together and enjoy themselves till the evening, when they again worship the idol and dance round it a second time." †

It is a pity that Tavernier has neither mentioned the name of the aforementioned snake-worshipping festival, nor has he left on record, for our enlightenment, further details thereof so that we might be enabled, at this distance of time, to identify it with the corresponding festival of modern times. It would appear that it corresponds with the Nagpanchami festival as it is observed throughout India at the present day.

I shall now describe and compare the various forms in which the *Nagpanchami* festival (or "The Dragon's Fifth") is celebrated in Eastern Bengal, Western India and the Southern Presidency. In Eastern Bengal, it is observed on the fifth day in the dark fortnight of the Bengali

month of Sravana (July-August). At the advent of the rainy season, snakes leave their holes in the flooded fields and jungles and enter the habitations of men—thereby throwing them into great consternation. It is in the month of Sravana that the greatest number of deaths from snake-bite occur in Lower Bengal. The people of the country-side labor under the impression that the only way of obtaining immunity from snake-bite is by propitiating the snake-goddess Manasa. The villagers, at this time, live in such a great fear of the snake that their womenfolk do not rest content with worshipping her only in the dark fortnight of Sravana but they also pay devours to her on the last days (Sankranti) of the months of Asadh (June-July) and Sravana. The devout women, before turning in for the night, join the palms of their hands, repeatedly touch their foreheads with the outstretched thumbs thereof by way of doing obeisances to the snake-goddess Manasa—"the mother of sage Astika"—and then doze off into sleep. On awaking from sleep in the morning, they utter the name of the goddess Durga several times and then leave their beds. Among the illiterate folks, the story of Behula, as embodied in the *Padmapurana*, is recited to the accompaniment of the "rub-a-dub-dub-dub" of the tom-tom and the tinkling of the cymbal. On the last day of Sravana, hundreds of boats with claymade images of the "Eight Serpents" (अष्टनाग) placed on their decks, may be seen floating along the flooded water-ways of the villages and taking part in the rowing-matches.

On the day of the Nagpanchami festival, boiled rice may not be taken. Unboiled milk and five plantains form the main offerings to the goddess Manasa. No incense may be burnt at the time of worshipping her. She is worshipped with the mumbling of the following *mantra* :—

श्रीं देवीमन्त्राद्गौरीनां मन्त्रपरवदनां चाहकारान्तिं वदन्त्या,
इमां कदापुनरां सुखस्तिनयनां सेवितां विद्विषामहे ।
अरेखां मन्त्रिणां कनकमणिगणेः नागररत्नेनैकेः,
वन्देऽहं साधनां उदकुचमगलां भोगिनीं कामदेयां ॥

The legend which is recited in connection with the celebration of this festival is as follows:—Once upon a time, a Brahman woman had three sons and three

* *Travels in India*. By Jean Baptiste Tavernier. Translated from the original French edition of 1676. 2 Vols. London: Macmillan & Co. 1879. Vol. 1, Page. 42.

† *Op. cit.*, Vol. II., page 249.

daughters-in-law, On a rainy day in the month of Sravana, the three daughters-in-law went to bathe in a tank. Addressing the youngest daughter-in-law, the eldest one said: "Had I been in my father's house, I would have, on such a rainy day as this, partaken of a meal of *khichri*." The second daughter-in-law, addressing her eldest sister-in-law, said: "Had I been in my father's house, I would have, on such a rainy day as this, partaken of parched rice and chick-pea mixed with melted ghee, roasted seeds of the jack-fruit and hot fried pan-cakes." But hearing the tall talk of her sisters-in-law, the youngest daughter-in-law held her tongue. Whereupon the former said to her: "Youngest sister, why haven't you said anything?" On this the youngest daughter-in-law heaved a heavy sigh and said: "Have I got anybody living in my paternal house? I had two elder brothers. Mother Manasa has taken them away. I have heard that, in their childhood, they died of snakebite. If you have a hankering for partaking of such delicious food on this rainy day, is it not practicable to have these dishes prepared with the permission of our mother-in-law? Do take your baths and go home. Let me see if I can catch two fishes from this tank and treat you to the same." On this, the eldest daughter-in-law said: "What will you get in the shape of fish from this ditch of a tank? It is true that nothing except *rui* (*Labeo rohita*) and *catla* (*Catla bichanani*) can be found in the two tanks in the outer compound of my father's house. But you will scarcely believe me if I tell you that climbing perches (*Koi* fish—*Anabas scandens*), one cubit long, abound in the tank in our backyard. Oh! how delicious eating they are!" The second daughter-in-law also said something "duchessy" in the same strain.

After the eldest and second daughters-in-law had left the tank, the youngest one found two *sol* fishes swimming about in the tank. She caught them and, taking them inside the kitchen, kept them covered up with a bell-metal vessel. Thereafter, when she took off the cover, lo! and behold her surprise on finding them not to be fish but two snakes. Then these two snakes, transforming themselves into two handsome young men, addressed her as follows: "Sister! Our names are Eyoraj and Muniraj. We are your elder brothers and living very happily under the wing of

our mother-goddess Manasa. We feel very much pained in mind on seeing you look so very small at the tall talk of your sisters-in-law. Come and we will take you to her deityship. And we will again bring you back here after a week." Saying this, they went to her mother-in-law and broached to her the proposal of taking their sister home for a short visit. Hearing it, the Brahman woman expressed her surprise and said: "Good gracious! I did not know before that my youngest daughter-in-law's brothers were alive." On this, the two brothers replied: "True it is that, in our boyhood, we had gone to foreign parts and had been bitten by snakes there. But we recovered from the effects of the snake-bite through the blessing of the mother-goddess Manasa."

Accompanied by their sister, Eyoraj and Muniraj crossed the seven oceans and, entering an extensive forest, reached the residence of the snake-goddess Manasa. There the sister of the two brothers was received with open arms and entertained right royally—being treated everyday to the most delicious viands. One day the goddess, addressing her with the most loving caresses, said: "Daughter! To-day is the Nagpanchami. I am going to the earth in response to an invitation on the occasion of my worship. Please you, on my behalf, do the cooking and feed your brothers. Give some milk to the *nagas* (snakes) for their daily meal. These *nagas* have been spoilt by too much caressing and get angry at the slightest trifle. See that they do not want anything." Hearing her instructions, Eyoraj's sister said: "Mother! don't be anxious. I shall do everything as you desire." Thereafter the goddess Manasa went to the earth.

It was a rainy day in the month of Sravana. Eyoraj's sister, thinking that hot food would be very palatable on such a day, boiled the milk and poured it, boiling hot, into the snakes' holes. But horror of horrors! The hot milk burnt the face of some of the snakes, the mouths of some; and the bodies of some were wholly scorched. At this, the *nagas* foamed with rage, and exclaimed: "What! We are Kadru's progeny. Our anger knows no bound when we think that a human girl should come and insult us in this way." The two brothers, accompanied by Astika, went to their maternal uncle Vasuki and, with his assistance,

māntra, obeisance should be made to the snake-goddess :—

जरत्कारमुनेः पत्नी मनसादेवि नमोस्तुते ॥*

We should now go to Western India and see how the Nagpanchami festival is held there. It is observed there on the fifth day of the bright half of the lunar month Sravana "which" generally corresponds with August and September of the Christian year." The fifth day of this month is held sacred to the *Nagas* or serpents. Early in the morning of this day, each household gets a clay image of a snake made or has a brood of five, seven, or nine serpents painted on a wooden board or on a wall with sandalwood or turmeric paste. The vessels used in the worship of the snake-goddess on this occasion are all made of the horns of the wild buffalo and placed in front of the representations of the serpent. Flowers, sandalwood paste, turmeric, parched rice and beans, or parched gram, and jowari (*Holens sorghum*) are offered to these snake-images. Lamps are lighted and waved before them; incense is burnt; and eatables and fruits are offered to them. On this festival-day, the people take only boiled food. After the morning meals have been partaken of, a lamp is lighted and kept burning all the day long close to the representations of the snakes. Offerings of milk and eatables are also kept standing in close proximity to the images. In the afternoon, people go to some locality, generally to an ant-hill, which is popularly believed to be the habitat of these ophidian deities. To these places, also, come the snake-charmers with their reptilian pets and hold an exhibition of them. It is said that, even in the city of Bombay, these snake-charmers go their rounds from house to house in the Indian quarter, exhibiting their pets to whom the people offer different kinds of food. In the evening, offerings of flowers are again made; incense is burnt; lights waved; eatables placed before the representations of the snakes; and one or more lamps are kept lighted throughout the

**"He, who does not grudge another's
good fortune,**

He, who grudges another's good

Hearing these words, the eldest and second sisters-in-law abandoned their attitude of jealousy towards Eyoraj's sister and made friends with her. Thereafter a son was born to the latter. Eyoraj and Muniraj celebrated their nephew's rice-eating ceremony with great *eclat*.

* The foregoing details of the Nagpanchami Festival as observed in Eastern Bengal, have been taken from a little Bengali book entitled "*Meyeli Vratakatha*" by Parameshprasanna Roy, B.A., and published by the Ashutosh Library No. 50-1, College Street, Calcutta.

night. The worshippers sit out the whole night playing at some game or other. This vigil is designated as "keeping the serpents awake." Or, more appropriately, it is the worshippers keeping awake for fear of being bitten by the snakes. It is the female members of each household that worship these ophidian deities. On the conclusion of the ceremonies, the women and the children of each family assemble together; and the eldest or the most intelligent of the female members recites the following legend setting forth the origin of snake-worship in Western India:—

In a city called Manikpura (or Manikpura) there lived a Gavada Brahman. He was ignorant of the Nagpanchami and did not know that no ploughing, digging, picking, burning or roasting should be done on this day. He, therefore, went to plough his field on the Nagpanchami day. Now there was a hole in his field which was tenanted by a female snake and her brood of young ones. Being cut up by the plough share, the latter died. The Nagin or female snake, who was absent from her hole at that time, returned and found that all her young ones had been killed. Hissing with rage, she went to the Gavada Brahman's house and, seeing his ploughshare besmeared with blood, at once came to the conclusion that it was he who had killed her young ones. She, therefore, bit the Brahman and all his family-members, who were asleep at that time; and all of them died. In order that his whole family might become extinct, she went to bite his daughter who lived in another village. But the Brahman's daughter had painted the Nagas (snakes) and, having worshipped and given them offerings, had, during the night, placed before them burning frankincense, lighted lamps, and eatables. The female snake was mightily pleased at the sight of all this and partook of the good things that were spread there. She then told the girl: "O daughter! Your father killed all my youngsters to-day while he was ploughing the field. I have, therefore, bitten to death all the persons in your father's house, and have come here to bite you. But as you have remembered and worshipped me, I am highly pleased with you and will not, therefore, bite you." On hearing this, the Gavada Brahman's daughter replied: "You have killed all my kinsmen in my paternal house. Point out to me some remedy whereby they all may be re-

stored to life." Whereupon the Nagin said: "Take this ambrosia and sprinkle it on their corpses. Thereafter all of them will come to life again." The Gavada Brahman's daughter did as directed by the Nagin and, thereby, restored all her kinsmen to life. Thereafter she informed her father of the circumstances under which he and his family-members had come by their deaths and of the means by which they had been restored by her to life. She, therefore, advised her father as follows: "Now, henceforth, when the month of Sravana comes, you should worship the Nagas (snakes) on the fifth day in the bright fortnight thereof according to the prescribed methods and should offer them, at night, frankincense, lamps and eatables, and should not dig and should not also kill anything on this day." Thenceforth, the Gavada Brahman began to act up to his daughter's advice, and all men began to observe the Nagpanchami vrata (or ceremony).*

We will now proceed to Southern India to investigate into the way in which snake-worship is done there. We find that in the districts of Canara, the Nagpanchami festival is celebrated on the fifth day of the light half of the month of Sravana. But in the Telugu and Tami districts, this festival is observed on the fourth day of the bright fortnight of the month of Kartika, Vaisakha or Magha and is, therefore, designated by the people of these parts as "Nagalu-chavati" or the Naga-chaturthi. The method in which the snakes are worshipped in the Southern Presidency is almost the same as that prevalent in Western India. In these parts also, the people go to the ant-hills popularly believed to be tenanted by the ophidian deities to make their offerings to them. In the districts of Canara, stone images of the Nagas are usually set up under the shadow of pipal trees (*Ficus religiosa*). Sometimes, images of snakes are made in metal and worshipped and then presented to the Brahmans. The ceremony of worshipping the snakes on the Nagachaturthi day is performed by women of the higher classes. In the same districts

* For a fuller account of the Nagpanchami Festival as observed in the Bombay Presidency, vide the late Rao Sahib Vishvanath Narayan Mandlik's paper on "Serpent-Worship in Western India" in *The Journal of the Bombay Branch of the Royal Asiatic Society*, Vol. IX, pages 169-200.

also, an incarnation of Seshha, one of the nine great Nagas, is worshipped, under the designation of Subrahmanya, on the 6th day of the bright fortnight of the month of Margasirsha (November-December). This day is, therefore, called Subrahmanya-shashthi. On the occasion of its celebration, thousands of Brahmans are treated to a sumptuous feast. People, who have not been blessed with children, take vows to devote themselves to the service of Subrahmanya, which they give effect to on the day of the festival by observing a strict fast and rolling themselves over the remnants of the food left on the platters by the Brahmans at the afore mentioned feast. On the day that the festival is celebrated, one of the officiating priests gloves one of his hands with a leathern bag and, by inserting this gloved hand into one of the holes believed to be tenanted by snakes, scoops out from it three handfuls of earth, known as the *mulamrittika* (the original earth) and doles it out to the assembled worshippers as a token of the deity's favours. *

In Malabar, the snake-god is worshipped by the Nambutiris on the *Nagarapanchimi* day which falls on the 5th of Sravana "when the star Aslesha is in the ascendant." The act of worship consists in bathing the god (most likely a stone or metal image of the ophidian deity) in milk. Mr. F. Fawcett says that this festival is common in Southern India and that he has seen a cognate ceremonial in the Bellary district. †

It will be seen from what I have said above that, on account of the great mortality that annually occurs in India from snake-bite, the snake is much dreaded by the people throughout the length and breadth of this country, and that the goddess, who is popularly believed to preside over these deadly reptiles—"Fit warders in the gate of Death" as Heber has very aptly called them—is worshipped by all sections of the Hindu community, specially by the orthodox and illiterate members thereof. But the method and time of worshipping her varies in different parts of India. We will, therefore, now examine them and set forth the main

points wherein they differ from and agree with each other:—

(a) In Eastern Bengal, clay images of the "Eight Nagas" are made and worshipped; whereas in Western India either a clay image of the snake-goddess is made, or figures of five, seven, or nine snakes are painted on a wooden board or upon a wall. In Southern India, either metal images of snakes are made for purposes of worship, or stone images of snakes are permanently set up under pipal trees for the same purpose.

Similarly, on the occasion of the *Rikki* or *Biruri Panchami* which corresponds to the *Nagpanchami* of the other parts of India and is celebrated in the submontane regions of the Himalayas, figures of snakes and birds are painted by the celebrants on the walls of their houses and worshipped with money and sweetmeats. * In the United Provinces of Agra and Oudh, the *paterfamilias* paints on the walls of his sleeping-room two rude figures of snakes and makes offerings to Brahmans; while the womenfolk draw, with flour, a serpentine line round about the residential house by way of a magic circle through which no serpents can enter. † In Garhwal, the celebrants of the festival draw, with sandalwood powder or turmeric, rude representations of five, seven, or nine snakes upon the ground which has been previously smeared with a mixture of cowdung and mud. ‡ While, in Kangra, after the Diwali is over, a festival is celebrated the chief function whereof is to say farewell to the serpents, and in which an image of the Nag made of cowdung is worshipped. §

(b) The ophidian goddess is worshipped, in Eastern Bengal, on the fifth day of the *dark fortnight* of the Bengali month of Sravana (July-August) and the last days (Samkranti) of the months of Asadh (June-July) and Sravana. Curiously enough, she is worshipped in Western India on the fifth day of the *bright* half of the lunar month of Sravana which is said to correspond with the months of August and September of the Christian year. (?) In the

† *See the Madras Government Museum Bulletin* (Vol. III., No. 1.) Madras: Printed by the Superintendent, Government Press 1900. pages 58; 84.

districts of Canara in the Madras Presidency, the worship takes place on the same day as in Western India. But in the Telugu and Tamil districts thereof, it is observed on the fourth day of the Bright fortnight of the months of Kartika, Vaisaka or Magha, or, occasionally, on the 6th day of the bright fortnight of the month of Agrahayana (November-December).

(c) In the absence of details, we must presume that the utensils used in the worship of the snake-goddess in Eastern Bengal are the ordinary ones—either made of brass or copper—used on this side of India. But a very curious feature of snake-worship in Western India is the use of vessels made of the horns of the wild buffalo. We have no means of ascertaining what sorts of utensils are used in Southern India.

(d) The partaking of cooked rice is forbidden in Eastern Bengal on the day of the worship. But in Western India, the celebrants of the worship may take boiled food. Perhaps the same practice is followed in Southern India.

(e) The burning of incense on the occasion of the worship of the snake-goddess is strictly prohibited in Eastern Bengal. But in Western and Southern India, as also in Garhwal, incense is burnt before her image.

(f) In Eastern Bengal, the principal items in the offerings made to the goddess are unboiled milk and five plantains. But in Western India (and most likely in the Southern Presidency also), flowers, fruits, sandalwood paste, turmeric, parched rice and grains and milk are offered up to her. In Garhwal, offerings of parched rice, beans, or gram, other kinds of edibles and fruit are offered to, and lighted lamps are waved before the figures of the snakes.

(g) It does not appear whether the celebrants of snake-worship in Eastern

Bengal ever go to an ant-hill or other locality believed to be tenanted by snakes to make their offerings to the latter. But they do so in Western and Southern India. In the eastern districts of the United Provinces of Agra and Oudh, milk and dried rice are poured into a snake's hole.*

(h) In Eastern Bengal, the people amuse themselves on the day of this festival with rowing-matches; whereas in Western India the celebrants of the worship keep awake and sit out the whole night indulging in games. We have no means of ascertaining whether or not this is done in Southern India. In Garhwal, the celebrants spend the night in hearing stories in praise of the Nag.

(i) Another distinguishing feature of snake-worship throughout India is that it is performed generally by the female members of the family. We have seen that, in Eastern Bengal, the womenfolk perform it. The same is the case also in Western and Southern India.

(j) A second noteworthy characteristic of this worship is that, at the conclusion of the ceremonies, a legend is recited generally by the eldest female member of the family. The legend, which is recited in Eastern Bengal, inculcates the necessity of observing the Nagpanchami festival for safeguarding the family-members from all sorts of harm and for ensuring the happiness and prosperity of the family; whereas the legend recited in Western India accounts for the origin of snake-worship. It does not appear whether any legend is recited in Southern India.

(k) A third feature of snake-worship is that no ploughing or digging can be done on the day of the Nagpanchami festival. This is especially the case in Western India.

ZEB-UN-NISSA'S LOVE-AFFAIRS

A URANGZIB'S eldest child, Zeb-un-nissa, (b. 15 Feb. 1638), is the heroine of some love-tales current in Indian literary circles. She was a gifted poetess and is said to have claimed an artist's

independence of morality. Similar creditable legends about Kalidas's life have long circulated among our old school of Sanskritists, but are discredited by sober historians (*Ind. Antiq.*, 1878, 115.) We shall

to-day try to ascertain whether the traditions about the Princess Royal of Delhi had a stronger basis in fact than those about the laureate poet of the court of Ujjayini.

No mention of Zeb-un-nissa's love-intrigue with Aqil Khan, or indeed any person whatever, is made in any work of her father's reign or even for half a century after his death. We can easily explain the silence of the court historians and other official writers, who would naturally suppress every scandal about royalty. But perfect freedom of speech was enjoyed by the private historians of the reign (especially the two Hindu authors, Bhimsen and Ishwardas), by Khafi Khan who wrote a quarter of a century after Aurangzib's death, and by the author of the biographical dictionary of the Mughal Peers (*Masir-ul-umara*), who lived a generation later still. The European travellers, Bernier and Manucci, wrote for the eyes of foreigners, and had nothing to fear from the wrath of Aurangzib or his posterity. Manucci, in particular, revelled in court scandals, so much so that his history of the Mughal (*Storia do Mogor*) has been well called a *chronique scandaleuse*. Would he have passed over Zeb-un-nissa's failings, if he had heard of any, as such a topic would have made excellent "copy" for his book? The gossip and outspoken Khafi Khan does not assail Zeb-un-nissa's character, though he openly proclaims the shames of Jahangir and Nur Jahan. The story of our heroine's love-intrigues is modern,—a growth of the 19th century and the creation of Urdu romancists, probably of Lucknow. The pretended Urdu Life of Zeb-un-nissa that holds the field at present is the *Durr-i-Maklum* of Munshi Ahmaduddin, B.A., of Lahor, who quotes from an earlier work, *Haiyat-i-Zeb-un-nissa* by Munshi Muhammad-ud-din Khaliq.

This story, in its most developed form is conveniently summarised in English (evidently from Ahmaduddin's Urdu work) in Mrs. Westbrook's introduction to her *Life of Zeb-un-nissa* in the "Wisdom of the East Series" (1913). She writes:

"In the beginning of 1662 Aurangzib was taken ill, and his physicians prescribing change of air, he took his family and court with him to Lahor. At that time Aqil Khan, the son of his *wazir*, was governor of that city. He was famous for his beauty and bravery, and was also a poet. He had heard of Zeb-un-nissa, and knew her virtues, and was anxious to see her. On pretence of guarding the city, he used to ride round the walls of the palace, hoping to catch a

glimpse of her. One day he was fortunate, he caught sight of her on the housetop at dawn, dressed in a robe of *gul-anar*, the colour of the flower of the pomegranate. He said, *A vision of red appears on the roof of the palace*. She heard and answered, completing the couplet, *Supplications nor force nor gold can win her*.

She liked Lahor as a residence, and was laying out a garden there: one day Aqil Khan heard that she had gone with her companions to see a marble pavilion which was being built in it. He disguised himself as a mason, and, carrying a hod, managed to pass the guards and enter. She was playing *chhunar* with some of her girl friends, and he, passing near, said, *In my longing for thee I have become as the dust wandering round the earth*. She understood and answered immediately: *Even if thou hadst become as the wind, thou shouldst not touch a tress of my hair*. They met again and again, but some rumour reached the ears of Aurangzib, who was at Delhi, and he hastened back. He wished to hush up the matter by hurrying her into marriage at once. Zeb-un-nissa demanded freedom of choice, and asked that portraits of her suitors should be sent to her: and chose naturally that of Aqil Khan. Aurangzib sent for him; but a disappointed rival wrote to him: 'It is no child's play to be the lover of a daughter of a king. Aurangzib knows your doings; as soon as you come to Delhi, you will reap the fruit of your love.' Aqil Khan thought the Emperor planned revenge. So, alas for poor Zeb-un-nissa! at the critical moment her lover proved a coward; he declined the marriage, and wrote to the king resigning his service. Zeb-un-nissa was scornful and disappointed, and wrote: '*I hear that Aqil Khan has left off paying homage to me*—or the words might also mean, '*has resigned service*—'on account of some foolishness.' He answered also in verse, '*Why should a wise man do that which he knows he will regret?*' (Aqil also means, a wise man.)

But he came secretly to Delhi to see her again, perhaps regretting his fears. Again they met in her garden; the Emperor was told and came unexpectedly, and Zeb-un-nissa, taken unawares, could think of no hiding-place for her lover but a *deg* or large cooking-vessel. The Emperor asked, 'what is in the *deg*?' and was answered, 'only water to be heated.' 'Put it on the fire, then,' he ordered; and it was done. Zeb-un-nissa at that moment thought more of her reputation than of her lover, and came near the *deg* and whispered, 'keep silence if you are my true lover, for the sake of my honour.' One of her verses says, '*What is the fate of a lover? It is to be crucified for the world's pleasure*.' One wonders if she thought of Aqil Khan's sacrifice of his life.* After this she was imprisoned in the fortress of Salimgarh.' (Pp. 14-17.)

Now, examining the above account in the light of known history we at once find that the story of the smuggled lover being done to death in a *deg* in the harem has been transferred to Zeb from her aunt Jahanara, of whom it is told by Manucci (*Storia*, i. 218) and Bernier (p. 13). The recorded facts of the life of Aqil Khan also

* This conjecture is incorrect. According to the conventions of Persian poetry the type of the perfect lover is the moth which consumes itself in the flame of a lamp without uttering a groan. Cf. Carlyle's 'Consume your own smoke'.

contradict the story in all essential particulars.

Mir Askari, afterwards surnamed Aqil Khan, was a native of Khwaf (in Persia)—and not the son of a Delhi *wazir*. He entered the service of Aurangzib in Shah Jahan's reign and attended the Prince during his second viceroyalty of the Deccan (1652-1657) as his equerry (*jilaudar*). He had already made his mark as a poet and adopted the pen-name of *Razi* from the saint Burhanuddin Raz-ullah whom he venerated. When Aurangzib started from the Deccan to contest the throne, he left his family behind in the fort of Daulatabad (6 Feb.—Dec. 1658), and Aqil Khan acted as the governor of the city from 6th February and of the fort from August 1658 till near the end of 1659. Arriving at Delhi on 8th February 1660, he was, two months later, made *faujdar* of the land between the Ganges and the Jamuna (Mian Duab), but replaced by another officer in July 1661. In the following November he temporarily retired from service on the ground of ill-health and was permitted to reside at Lahor on a pension of Rs. 750 a month. When in November 1663 Aurangzib was passing through Lahor with his family, on his return from Kashmir, Aqil Khan waited on him (2nd November) and was taken into the Emperor's train and appointed Superintendent of the Hall of Private Audience, a position of very close contact with the Emperor, (January 1664). Evidently he continued to enjoy high favour, being promoted in October 1666 and given a royal present in May next. Later on he was made Postmaster General (Darogha of Dak Chauki), but resigned in April 1669 and seems to have lived under a cloud for the next seven years, as we find no mention of him till October 1676 when he was granted an allowance of Rs. 1,000 a month. In January 1679 he was taken back into service as Second Paymaster. Being appointed *Subahdar* of Delhi in October 1680, he held that office till his death in 1696.

Thus we find that the story of young Aqil Khan having been roasted to death in a cauldron by order of Aurangzib, is utterly false. No man below thirty could have been put in charge of a fort containing Aurangzib's wives and children on the eve of the war of succession, and, therefore, Aqil Khan must have reached the full span of human life at the time of his death.

From the life sketch of Aqil Khan we find that he was at the same place with Zeb-un-nissa first at Daulatabad in 1658 (some ten months), then at Lahor in 1663 for a week only, thenceforth with the Imperial Court at Delhi and Agra, till his resignation in April 1669, again with the Court during the Rajput wars of 1679 and 1680, and finally at Delhi from January 1681 to 1696. It was only during the first and last of these periods that he could have been tempted to court the Princess by the absence of her august father.

The Khan's temporary retirement from service and residence at Lahor away from the court (Nov. 1661-Oct. 1663) could not have been due to Imperial displeasure as he was given a large pension all the time. But his long removal from the capital and Emperor's entourage for ten years (1669—1679) during the first seven of which he was denied any imperial bounty shows that he had for some reason, unknown to us, fallen under the Emperor's wrath.

Was it a punishment for making love to Zeb-un-nissa? A letter to her from her brother Prince Akbar, written in 1680, contains the statement, "As the Emperor has now ordered that no packet (*na/wo*) bearing the seal of Aqil should be admitted to the ladies' apartments of the palace, it is certain that papers will have to be now sent [by me?] after careful consideration."

Was this Aqil her alleged lover Aqil Khan Razi the poet? I think, not. There was at this time in Akbar's camp a Mulla named Muhammad Aqil, who afterwards signed a manifesto pronouncing canonical sentence of deposition on Aurangzib in favour of Akbar, for which the luckless theologian was imprisoned and severely bastinadoed when his patron's rebellion failed. Zeb being herself a Quranic scholar and a patron of new commentaries on the Muslim scripture, correspondence between her and a noted theologian like Mulla Muhammad Aqil would naturally pass unsuspected. The writer of the letter implies that his own confidential letters to his sister used to be sent under cover of Aqil's envelopes, which could reach her unchallenged, while packets bearing his own seal on the cover might have been intercepted by his enemies. This is quite clear from the concluding part of the letter: "The delay that has taken place in my

writing to you is solely due to the fear lest my letters should fall into the hands of other people [lit., strangers, i.e., enemies.]”

The theory that the Emperor stopped the poet and noble Aqil Khan's correspondence with his daughter on detecting an intrigue between them, is discredited by the fact that only a few months afterwards he was appointed to the highly responsible post of viceroy of Delhi, the very place where she was sent as a state-prisoner early next year.

Zeb-un-nissa was imprisoned by her father in January 1681, and the official history establishes beyond dispute the fact that it was in punishment of her complicity with Prince Akbar who had rebelled against the Emperor.

The letter from which we have quoted contains several passages showing how deeply engaged she was in her brother's interests. He says, “What belongs to you is as good as mine, and whatever I own is at your disposal,” and, again, “The dismissal or appointment of the sons-in-law of Daulat and Sagar Mal is at your discretion. I have dismissed them at your bidding. I consider your orders in all affairs as sacred like the *Quran* and *Traditions* of the Prophet, and obedience to them as proper.”

When Akbar's rebellion fizzled out and his abandoned camp near Ajmir was seized by the imperialists (16 January, 1681), “Zeb-un-nissa's correspondence with him was discovered, she was deprived of her pension of four lakhs of Rupees a year, her property was confiscated, and she was lodged in the fort Salimgarh at Delhi.” (*Masir-i-Alamgiri*, 204.) Here she lived till her death in 1702. It would be sweet to imagine that during this captivity our

High born maiden
In her palace-tower
Soothed her love-laden
Soul in secret hour
With music sweet as love, which overflowed her
power,

and that she wrote at this time the pathetic laments which Mrs. Westbrook has translated on page 17:—

So long these fetters cling to my feet!

My friends have become enemies, my relations are
strangers to me.

What more have I to do with being anxious to
keep my name undishonoured,

When friends seek to disgrace me?

Seek not relief from the prison of grief, O Makhfi;

thy release is not politic.

O Makhfi, no hope of release hast thou until the
Day of Judgment come,

But history is silent on the point. On the other hand our ardour to weave a romance out of her captive life is chilled by the reflection that she was now an old maid of 43 and Aqil Khan was at least twelve years older.

Another legend makes her fall in love with Shivaji the Maratha hero at first sight on the occasion of his being presented to the Emperor at Agra on 12th May 1666. Fifty years ago a novel was written by Bhudev Mukherji in Bengali describing how the lovers exchanged rings and parted. But it is a fiction and nothing more. Not to speak of the Persian histories of the time, no Marathi life of Shivaji mentions that a Mughal princess interested herself in the fate of the captive chieftain in her father's capital. I have searched through the *Bakhar* of Sabhasad (Shivaji's earliest life) the *Shiva-digvijay* (supposed to have been written in 1718 and forming the fullest and best account of the hero), the inaccurate and legend-loaded *Bakhar* of Malhar Rao Chitnis (composed in 1810), the confused hotch-potch cooked at Baroda in 1829 and published in 1895,—viz., the *Shivaji-pratap*,—and even the “Raigarh Life”;—but none of them gives the smallest hint of the champion of Hindu revival having coquetted with a Muslim sweetheart in the enemy's den. Zeb-un-nissa's aesthetic sense, too, would have saved her from throwing her heart away to a rugged and illiterate Deccani. The whole story is not only unhistoric, but also absurd.

Her captivity at Delhi does not seem to have been relaxed during her life. The official history records her death thus, “The Emperor learnt from the news-letter of Delhi that the Princess Zeb-un-nissa had drawn on her face the veil of God's Mercy and taken up her abode in the palace of inexhaustible Forgiveness, [26 May, 1702.] At the parting of his child, dear as his life, his heart was filled with grief and his eyes with tears. He could not control the weakness that overpowered him. [At last] he recovered self-possession [somehow], and ordered Syed Amjad Khan, Shaikh Ataullah, and Hafiz Khan to give away alms [at her funeral] and build a place of repose for her, as had been decided beforehand, in the Garden of Thirty Thousand [outside Delhi] which was a bequest from Jahanara.” (*M-i-A.*, 462.)

JADUNATH SARKAR,

THE EVOLUTION OF JAPAN

BY LALA LAJPAT RAI.

III

THE third factor which has contributed to the free development of the industries of Japan is her merchant marine. Here again we find that it was the Government of Japan that took the initiative and gave material financial and other support to private enterprise in this line.

At the time of the Restoration in 1868 A.D., Japan had practically no merchant marine. In 1870 the Kaish Kaisha, the first Japanese Steamship Co., established the first regular service between Tokyo and Osaka, two coast-towns, *via* Yokohama and Kobe, also coast-towns, under instructions from Government, the lines leaving thrice a month. In 1875 another company opened the Yokohama Sanghai line and next year extended their service to other ports on the Chinese and Russian coasts. In 1876 Japanese licensed mariners numbered only 76 and of these *only 4 were Japanese subjects*. In that year there was only one Japanese pilot as against 15 of foreign nationality. In 1914 there were 26 Japanese pilots as against 6 foreign. In 1895 there were 4135 Japanese licensed mariners as against 835 foreigners. Ordinary seamen aggregated 38217 in 1900 and 202,710 in 1904.

In 1891 the volume of Japan's merchant vessels did not exceed 15000 tons gross, but by 1896 it had increased to 109,000 tons as a result of the purchase of foreign vessels by the Government. The total tonnage existing at the end of 1903 of 979000 tons jumped to 1,527,000 tons in 1905. The latest returns at the end of March 1914 represent the gross tonnage of steamers at 1,538,000 and that of sailing ships at 491,000.

In 1896 a legal provision was made for granting bounties to the builders or purchasers of vessels and for subsidising the shipping industry. It was in 1898 that the first large steamer was built in Japanese Dockyards. It was of 6000

tons. Since then the Japanese Dockyards have built steamers of 10000 tons displacement and two dreadnaughts of 27,500 tons. At the end of 1912 the private ship-yards numbered 228. The Government has been regularly giving a bounty on every ship since 1896. In 1912 the Japanese shipbuilding companies built 7 ships of 17,183 tons, in 1913, four of 34478 tons and in 1914 fourteen of 66,329 tons. In May, 1915, the Japanese shipbuilders had in hand orders for 51 vessels of total tonnage of 212,100 tons.

Besides bounties for shipbuilding the Government of Japan has been subsidising regular services. Under the law of 1896 the subsidies were of two kinds; a general subsidy granted on specified routes and another open to all steamers in conformity with the provisions of the law. In 1910 the law was modified abolishing the general subsidy and restricting it to over-sea navigation; for example, (1) The European route, (2) The North American route, (3) The South American route, (4) The Australian route. The latest addition is the Java route.

The vessels to be used in the subsidised navigation must be home-built vessels of over 3000 tons gross, not less than 15 years old and having a speed exceeding 12 nautical miles per hour. For foreign-built vessels under 5 years old and put on service with the sanction of the authorities one half of the subsidy is granted. For vessels built according to plans approved by competent authorities a specially high subsidy is allowed. 26 steamers of 5000 to 13500 gross tonnage with a speed of 13 to 20 knots were engaged in this over-sea subsidised service in June last. Since then the number has risen. Coasting trade in Japan is forbidden to steamers flying foreign flags. Besides, the Government subsidises the coasting and near sea services also liberally. The amount of the latter subsidy alone comes to about 2 million yens.

At the end of December, 1914, the num-

ber of Japanese registered steamers reached the total of 1577 with a gross tonnage of 1,577,025 tons.

The five years term of subsidy contracts expired in 1914 and the Government had to renew contracts for one year on its own responsibility, as the bills could not be passed in time owing to the dissolution of the Parliament.

Under the new arrangement sanctioned by Parliament the European service gets a subsidy of 8,657,989 yen in five years, beginning with 1,832,806 yen in 1915-16. The North American Service gets 13,855,010 yen, the South American 1,446,888 and the Australian 875,501 yen, which means that in the next five years the Japanese Government will pay a subsidy of about 40 million yen on these Four High Sea services alone, equal to 60 million in Indian Rupees.

How the Japanese have eliminated foreigners from their marine will be clear from the following table. We give the figures for 1913 :

	Japanese.	Foreigners.

I do not think your readers require it to be explained how national marine helps national industries and national trade. The thing is obvious.

IV. CUSTOMS DUTIES.

Reading Count Okuma's preface to a volume published in 1910 under the name of "Japan Industries" one might think that Japan was a Free Trade country but the following extracts from Count Okuma's Fifty Years of Japan, Volume I, p. 371, show that Japan has never been a Free Trade country.

Marquis Matsugata, the writer of the Chapter on "Japan's Finance" says :—

"The customs duties at the time when Japan's door was opened to the world, were fixed on an average, at the rate of 20 per cent. on imports. But as a result of interference on the part of foreign coun-

tries during the old *regime*, the actual customs duties both on imports and exports, which the new regime inherited from the old, averaged only 5 per cent. This system of 5 per cent customs duties had been rendered incapable of expansion by the treaties then existing, and therefore could not vary with the varying demands of the Imperial Treasury or with the condition of commerce and industry. In short it had no elasticity."

As a result of new treaties beginning with 1894 and in force since January 1899, duties on imports were fixed at 10 per cent, *ad valorem*, and those on exports were soon afterwards altogether abolished. The statutory tariff rates have since then been revised from time to time. The income from customs dues in 1899 amounted to less than 7 million yen. In 1913 the income was 73,580,000 yen and the average percentage of custom duty was 19.98. The actual scales at which duty is charged on manufactured goods are pretty prohibitive. Even an American writer calls them excessive.

Then there are other kinds of protection which the Japanese Government affords to some branches of the national commerce; for example, no foreigner can acquire the ownership of Japanese ships or even any shares in steamship companies, nor in the Bank of Japan, the Yokohama Specie Bank, or the Agricultural and Industrial Bank. No foreigner can acquire "the right to work mines" or can "become a member of the Stock Exchange" or can "engage in the emigration business." Until recently the ownership of land was prohibited to foreigners, but when the Americans raised the question of Japanese acquiring rights of ownership in lands in California the Japanese Government abolished this prohibition "on the principle of reciprocity." The first article of the law relating to foreigners' right of ownership of land provides that "a foreigner resident or having domicile in Japan or a foreign juridical person registered in Japan is entitled to have ownership of land, if the law of his own country allows the ownership of land to Japanese subjects or Japanese juridical persons, provided that the foreign juridical person must obtain the permission of the Minister for Home Affairs before acquiring the ownership of land."

Certain exceptions are made as to the lands in certain provinces on the ground

that the same are necessary for national defence. This is by no means an exhaustive list of the protection which the Japanese Government extends to the industries and trade of the country.

There are subsidised organisations whose business is to give facilities to Japanese to go to other countries and settle there. The fact is that there is hardly any branch of industrial or commercial activity in

Japan in which some kind of initiative has not been taken by the Government, or which was not subsidised by the Government at some stage of its evolution. That explains the wonderful progress made by Japanese industries in such a short time. Even at the present moment it is under consideration to start the manufacture of aniline dyes either as a wholly Government industry or as a subsidised one.

•LIFE'S FUNCTIONS

(2) PLAY.

•BY WILFRED WELLOCK.

I have already defined play as activity which has for its immediate end one's own good, which good among other things, includes pleasure. In this, play differs from work, which often has for its immediate end the welfare of others, and frequently brings pain, weariness and suffering to oneself. In play the individual is free to follow his inclinations, whereas in work he has to be guided by demands and considerations which lie outside himself. Play is work's antidote, that wherein the restraint involved in work is relaxed; naturally, therefore, pleasure will always be one of the objects of play. Moreover, play is the complement of work, repairing what work has destroyed, both in a physical and spiritual sense. Thus play is the soul's as well as the body's feeding time; that in and through which the mind regains its self-mastery, recovers its lost possessions, its strength, enthusiasm and ideals and thus prepares itself for fresh conquest.

And because play is self-chosen, and has for its object the individual's own good, it always yields pleasure. Indeed it is its pleasure-yielding power which usually distinguishes play from work. Not that play has no utility except pleasure, but that in addition to ulterior ends, which may be many and various, pleasure is always an object of play. If an activity

did not promise pleasure it could not in any sense be described as play.

Play, like work, is an integral and necessary part of life, and, like it again, is governed by a law, which can only be transgressed at the cost of well-being. Pleasure is a form of the Good, a mode of life. Moreover, that which yields true pleasure is always beneficial to the mind and spirit, a means of preparing one for finer experience and loftier attainment. And because the ulterior objects of play are numerous, one ought not to play indiscriminately. It is possible to play too long just as it is possible to work too long; one may also play in the wrong way—with a wrong idea, and at the wrong thing. Play only gives true pleasure when it is in response to real need, need that has been created by labour, purposive effort. People who do not work derive scant pleasure from play; which explains why idle people are always being carried away by "crazes." Nothing really satisfies them, yet they are always living in hopes that something new they have heard of will give them that which they are seeking. But of course it never does.

Play has several functions and is of many kinds. Necessarily so, seeing that man has many needs. For play is the time when man replenishes his mind with new ideas, new truth, receives the inspiration which is to help him carry out his

purposes. The higher a man rises in the scale of development and the deeper and more complex his spiritual nature becomes, the more numerous will be his interests and needs; from which it follows that he will require a more varied play life. Obviously, therefore, play ought to be thought about, regulated so as to satisfy all the soul's needs. Thus as it was our object in the two previous articles to reveal the meaning and function of work as well as the law of its regulation, so in the present article it will be our object to reveal the meaning and function of play, and also the law of its regulation.

Although the modes of play are innumerable they can all be subsumed under four functions. These are: (1) To give rest to body and mind; (2) To recuperate the animal spirits; (3) To refine; (4) To inspire. Perhaps a simple illustration will best serve to illustrate the nature of these functions.

A man has finished a hard day's work and goes home at even-tide. Too tired to speak he sits by the fire, with feet outstretched. His wife is aglow with smiles and cheery comments, his children relate their stories, the adventures of the day, while the fire maddens itself in the effort to give an uproarious welcome. The tired husband and father looks quietly on, a scarcely perceptible smile playing about his features: he is afraid to speak, lest he should break the spell, so sweet is the luxury of rest. And so he sits, revelling in the delicious sensation of perfect rest. His very tissues tingle, his heart swells, and the wine of life courses through his veins. He thinks of the day's work done, and then looks about him and feels what it all means; and he is satisfied. That is rest.

When the evening meal is over and the tea-things are put away, father and children romp together until the house rings with their laughter, while the mother looks on happy to see her husband and lover a boy again. Or if it be summer, they make for the fields, where they walk and frolic to their hearts' content. They breathe the cool evening air and feel revived as they do so, while Nature feeds them with the refreshing scents of earth, herb and flower. When they return home they feel strong, rejuvenated. What glorious exhilaration! Life is youth and energy!

Seated now before the fire, the man who

a couple of hours before had been working at some craft or art, gives himself up to quiet musing. His heart rejoices as his eye wanders over things dear and familiar, and he drinks in the beauty that surrounds him. The shining fire-irons, the inviting chairs, the embroidered covers, the flower-vase on the table, the exquisite pieces of handiwork here and there, are almost living things to him, beings which smile at him through their beauty. And from these things his eye turns to the sharer of his joys and sorrows, to that form whose every movement is a grace, whose touch is language, and whose glance is a shaft of light. Then he watches his children play, notices their delicate movements, the dancing eyes, admires the electric, soul-permeated forms. And thus in the simple but overflowing beauty of his home he rejoices. How sweet and beautiful it all is! Life is a delight.

The children are asleep; friends have come and gone; there is still an hour to spare. A favourite book is unshelved, and the pair, husband and wife, read and commune together, meditate on the great problems of life. Thus do they come to grips with the deeper life of thought, see and feel the momentous issues and possibilities of life, and think upon the heroic and glorious achievements of men. They thus strengthen their hold upon life, and rise from their meditation stronger in spirit, refreshed, invigorated, inspired, full of a holy enthusiasm for spiritual conquest and attainment.

We will consider these four functions of play a little more closely.

(1). Rest is a universal need of man, and a form of pleasure; it is thus an essential function of play. The first requisite after hard work is rest; sheer rest: rest from the weariness of toil; rest from anxious thought; rest from every call of duty. The man neither understands himself nor does himself justice who, after heavy labour, does not seek complete rest. Few people know the luxury or realise the value of absolute rest, of throwing off every restraint and abandoning themselves to momentary oblivion. Hard work drains both mind and body, and subdues the spirit. It brings the strong man low, and transforms the indomitable hero of the morning into the passive citizen of the evening. In the hours of rest which follow

toil, in the quiet of hearth and home, as well as in sleep, the strength and spirit that are spent in work are renewed. Thus the duty of taking rest is a very important one. It is in rest that one oftenest feels the sweetness and grandeur of toil, as it is only in rest that a man can come to himself; and it is all-important that every man should often do that. Unless a man rests, looks into his own soul, how can the deep truths of life come to him? Deep down in the abyss of the subconscious self there is a voice that would ever utter a clear and true judgment on the value of the life we are living; did we but give it the chance to do so. Thus rest has a spiritual as well as a physical significance, being an indispensable condition of moral and spiritual improvement. Man realises himself in work and in play; but it is only in rest that he becomes conscious of that realisation. If a man never stops to rest, but rushes on from one pursuit to another, how can he know if he is living truly? And what is sweeter or sublimer than to sit in one's home at eventide among the people and things one most loves, leisurely listening in the very tiredness of a hard day's work to the verdict of the heart, and to feel that life is good?

The beginning of good play is sweet and complete rest. But rest cannot be sweet unless work has been well and justly done. Satisfying rest is something of a sacrament, a testimony that our life is on right lines. The function of rest is to accomplish the first stages of physical and mental recuperation; to pervade the soul with satisfying peace; to carry home to the mind a sense of the infinite grandeur of life and so deepen the joy and love of living.

(2). In order completely to revive the animal spirits after the exhaustion caused by work, a more vigorous form of play is called for. What most people require after hard work, at any rate, periodically, is some sort of outdoor exercise, some form of sport, etc. And although sport requires a great amount of energy, because it is a form of play, is self-chosen and is thus entered into with gusto, it exhilarates even increases energy. The reason for this is apparent. Because sport is of short duration, and is undertaken for the pleasure it affords, the body is relaxed, whence, the veins and arteries being thrown open, the blood circulates freely through the

system and produces a sensation of exhilaration, both mental and physical. Indeed it very often happens that a man who believed himself tired out, will after devoting an hour or two to some sport, feel more refreshed and energetic than he did before. Another reason for this effect is that play causes to be put into operation parts of the physical machinery that work does not use, and that would otherwise grow stiff and useless. To quicken these parts gives one a new sense of power. In thus reviving the animal spirits, sport increases the sum of physical energy, stimulates the pulse, and thus quickens the mind, intensifies the consciousness of life, and makes one feel more alert and alive, mentally and physically vigorous. Moreover a quickened blood action tends to elevate the spirit and to produce an optimistic temperament. One generally finds that mental depression and reduced vitality go together. And it is a common experience to see thoughtless people continue in a state of lassitude for weeks together, when a little outdoor exercise would brace them up and turn them into new creatures.

A still further reason why sport stimulates is that one has generally to overcome obstacles and attain certain ends, such as to become victor in some game of force or skill, to lead, as in a race, to endure etc.

Then, too, sport has a direct social utility. Because most games are played by groups of individuals, they bring into operation many powerful social forces; while snobbery, class distinction and favouritism, etc., are the death of sport. Thus in play a spirit of comradeship is generally manifested which, unhappily, is too often suppressed in the more serious occupations of life. When fashion and precedence enter the play-field sport leaves it. In play a man is at his best, and endeavours to put into his pursuits a spirit that ought to dominate his entire life. For play is life's training ground.

But there are other kinds of play that ought to be considered under this heading, such as pageantry, and many hobbies, as, for instance, gardening, model-making, etc. These usually require a certain amount of skill and muscular activity, but not nearly so much vigour as sport. Their chief merit is that they give scope to the imagination, and are specially beneficial in cases where work

stereotyped nature. Of course there is a certain amount of imagination required in all sport, as in football, for instance, the best player is bound to be the man who can keep in his mind a picture of the rapidly shifting field, who can "see" at a glance what will happen if a kick be made in this or that direction. But play ought always to be in some measure the complement of work, a means of developing those powers and faculties which are neglected or stifled in work. Work is restrictive; but human nature rebels against restriction, and thus seeks redress in play.

In play nature endeavours to win back the possessions that have been lost in work. Play is thus man's salvation, the means whereby he is rescued from the limitations and degradation of convention and routine, and enabled to develop the power wherewith to rise to the full status of manhood.

Then there is always a danger of play being turned into work. As soon as remuneration enters into play the tendency is for the object of one's effort to change; and thus for play to be converted into work. Professionalism is the death of play, so far as the "players" are concerned; their play having become their work they will have to turn in other directions for their play.

(3). In considering the third function of play, which is to refine, a distinction ought to be drawn between two kinds of art,—physical or aesthetic art and spiritual art; the art of form and the art of ideas, of character and conduct. The purpose of aesthetic art is to reveal the beauty of form; that of spiritual art to reveal the beauty of truth—the truth of life,—and of the human spirit, of noble conduct, etc. It is with the former that we are specially concerned in the present section. Aesthetic art, having reference to form and arrangement, line and colour, appertains to things physical; whereas what I have called spiritual art has special reference to man, to human life and character, to conduct, virtue. In a sense all art is spiritual, and has for its object the culture of the spirit; but there is a wide difference between the art which describes the beauty of physical, static things and that which describes the doings and achievements of the human spirit. Physical art depicts external beauty and shows us what we ought to love and

admire; whereas spiritual art reveals truth and goodness and shows us what we ought to do and be. Thus the former delights and refines, while the latter inspires and ennobles.

Aesthetic art is represented to a greater or less extent by all the Arts. But architecture, sculpture and painting are almost wholly physical arts, being chiefly concerned with form, line and colour; that is, with the description of static objects, including Nature. Literature, music and the drama, on the other hand, admitting of a time series, are peculiarly fitted to deal with conduct, to reveal the moods, expressions, and experiences of man. At the same time literature is often used as a medium for describing inanimate objects, Nature, etc., while the stage depends to a very large extent, upon painting and statuary for its effects; and even music is frequently used to imitate physical sounds and to create sensuous pleasure.

But in distinguishing between physical and spiritual art it must not be thought that only the latter has moral value. Both forms of art carry with them a moral imperative, and tell us, the one what we ought to admire, the other what we ought to do and be. As is often said, the good is beautiful and the beautiful good, the one being implied in the other. Were we to look deep enough we should find that all our conceptions of beauty were based on a belief in utility. If beauty were not a sign of, and a guide to truth and goodness, it would be a positive snare, a false guide, a huge contradiction. Beauty is the promise of life, of pleasure and happiness, and in loving the beautiful we believe we shall reap a sure and certain good. Of course, false ideas of beauty exist just as false ideas of truth exist; but they are due to ignorance, to a mistaken idea of utility. If we believe that a thing is beneficial we shall come in time to think it beautiful, and if we believe that a thing is harmful we shall in time come to think it ugly. But I hope to deal more fully with this aspect of the subject in the next article.

Physical art delights and gladdens the soul because of beauty, for beauty is the sign and guarantee of the useful and the good. But not only does man love the beautiful, he craves for it, for the simple reason that he ever aspires after a more perfect life; and beauty is a fingerpost to such a life. Even the savage has an in-

instinct for beauty, and adopts some form of personal decoration. But as we ascend the ladder of civilisation we observe a remarkable growth of the art instinct, a tendency to bring beauty into every department of life. The poorest peasant pays great attention to the art of dress, and to the decoration of his home, which is often crowded with crude ornaments, beautiful specimens of his own handiwork or that of some member of his family. The more money people earn the more do they spend on beautiful things for the enjoyment of leisure hours. And in order to have beauty they will work infinitely harder than they would otherwise have need to. The love of beauty is instinctive, for art is the bread of life, the food of the spirit.

Art vitalises life and gives it new meaning, thus renewing the spirit, that buoyancy of mind which work tends to destroy. By means of beauty art delights and gladdens the mind, and thus creates new enthusiasm for fresh conflict. Necessarily so, for art, like faith, is the substance of things hoped for. When the true workman goes forth to his labour he does so with a sense of beauty permeating his soul, else how could he work well, put beauty into things? But by reason of long contact with the formless and ugly, labour tends to destroy the image and efficacy of beauty and thus to call for leisure in which the soul may again feast on beautiful works of art.

Beauty is an upward-moving force, the truth of things felt. Art is truth expressed in terms of feeling. Thus beauty is a fingerpost to life, the handmaiden of truth, man's fair guide to the good. Of its very nature beauty inspires man with a desire to reproduce it, and so help make the world a pleasanter place to live in.

To the man who lives truly, therefore, art is a daily necessity, as much a necessity as air and sleep. For to work is not simply to make things, but to make them well, to impart to them such beauty as they are capable of receiving. It is thus to add to the joy as well as to the beauty of life. All art gives pleasure; firstly because it is the transmission of beautiful feeling, and secondly because it is the promise of a more abundant life.

But to appreciate good art one must work as well as play, as without work one's ideas become unbalanced, divorced from reality. Purposive work is what keeps one in touch with reality; and the

man who does not work will have an abnormal appetite for art or so-called art, just as he will have an abnormal appetite for food. That is why in times of material prosperity, when there is a large idle class, art deteriorates. Nothing is so fatal to art as idleness; for to be idle is to divorce art from life, from every vital cause and every spiritual need. A man cannot appreciate beauty unless he is helping to it. Idleness gives rise to decadent, exaggerated art, which being unnatural, is devoid of all inspiring idealism.

On the whole we may say that what I have called physical or aesthetic art, corresponds to the Greek conception of art. To the Greeks beauty was an atmosphere to be breathed perpetually as one breathes air. But their art was chiefly the art of form, even in conduct it was the form rather than the purpose or essence of an act that they considered. The attraction of man was the attraction of physical and external rather than internal and spiritual characteristics. Indeed Greek art was for an aristocracy, a well-born and leisured class; consequently it was always more a means of aesthetic delight than of inspiration. The Greek conception of man and of virtue was far removed from the Christian conception. To the Greeks order and form were the primary things; goodness, gentleness, loving kindness, etc., being quite secondary things; to act rightly or virtuously was to act decorously. As it was with their temples, so it was with Government and with man: form, order, symmetry, beauty were the essential things. The true democratic spirit was never born in Greece, and in almost every state, slavery continued to the very end. Beautiful form was not simply a virtue, it was the virtue. To act undecorously was to act wickedly, a graceful act standing in far greater esteem than a kind one. To lose one's temper was to sin against art rather than against society. The ideal Greek was the man of noble bearing, in whose step was majesty and on whose brow was dignity; the man of proud spirit whose every resource was under perfect control.

With the Greeks we can go so far as to say that beauty ought to be the native atmosphere of man—in the home, in places of amusement, in the street and public thoroughfares, etc. It is almost impossible

to be surrounded by too much beauty, as the more beauty we have the more perfectly will the spirit of it enter the soul and manifest itself in all we do. Beauty is the sign of virtue, and to love beauty and to be surrounded by it so that the very rhythm of it gets into the blood, so to speak is to be helped on the way to virtue. Drunkenness and bad temper are both horrible from the æsthetic point of view, and it is possible to make them hateful and impossible through the right culture of the æsthetic sense. To learn to do things rhythmically, because rhythm is beautiful, will ultimately lead us to do them because they are good, beneficial. Art is thus a beautiful teacher, luring the soul to virtue by means of beauty.

Physical art yields delight, and by its promise of pleasure draws man to the contemplation of the beautiful, and thus to virtue. We cannot live in any atmosphere for long without being affected by it, and even the simple pictures on our walls, which have perhaps been placed there unthinkingly, exercise a wonderful influence upon our own and our children's minds. Art is for life, to ennoble and increase it. It is a spiritual and refining force, a condition of noble work, beautiful expression. Right feelings, as well as right conceptions, are necessary to the best conduct, and to the production of useful and beautiful things. For what is skill but inspiration, the touch that is born of a strong, harmonious feeling? The burden of all good work is harmonious feeling; and physical art is the expression and transmission of such feeling.

4. Spiritual art is the highest form of art, and also of play. Obviously, for it is specially concerned with the human spirit, its manifestations and aspirations. Man as an aspiring, spiritual being is different from every other form of being; thus the art which treats of man must be a separate art. It is the function of spiritual art to portray all that is beautiful and heroic in human nature; to reveal and teach the ideal life for man, the relationships which he ought to cultivate.

Literature is the paramount spiritual art, because literature, unlike sculpture and painting, admits of a time series, and unlike music, deals definitely with ideas. Sculpture and painting, except by implication and suggestion, are confined to a single moment of time, and are thus not fitted to

deal with action, conduct. Although, by seizing the right moment, painters have often been able to reveal a life-history in a single painting, to give a true judgment of the value of a given mode of life. But generally speaking the history of the person portrayed requires to be known. Because of its great vivifying power painting is admirably suited to illustrate and supplement literary description. Of all the arts music is the most direct revealer of subjective moods, feelings and passions, and, as such, is essentially a spiritual art. But while music expresses feelings more intensely and realistically than any other art, it is powerless to express an idea with any degree of definiteness, as the conceptional effect of a composer determined by the imagery his hearers are able to draw upon or create. Music may drive a man out of himself, cause him to step the unknown world of unrealised experience, and even to modify his conduct; but it cannot give him any definite ideas, teach him new truth. To do that he must have resort to letters.

But if painting and sculpture are the most vivid of the arts, music is the most intense, and literature the most complete. Music, with its medium of sound is the universal art; for sound appeals to all, being a means of expression even in the animal kingdom. Passion, anger, hatred, sorrow, etc., can all be expressed by simple ejaculatory sounds. But with literature the case is different. Literature makes its appeal through highly complex symbols, or letters, which are rendered more complex still by being formed into words and phrases. And the more complex the medium through which the artist reveals himself the greater the difficulty of adequate self-expression. That is why there are so few prodigies in literature as compared with music. But whereas music is dependent upon the recipient subject for the scaffolding of imagery which holds the emotional experience together, literature builds up its own and reaches the emotions through these. And if the emotional effect is not so intense in the latter case, definite ideas, truths which can be uttered and demonstrated, can be expressed and transmitted.

Thus because literature is the only art which works through ideas, it is the most fitted to deal with the facts of human life, to portray experience and character, to

treat of conduct and depict the ideal life for man. Life is a conquest, a process of spiritual expansion, a gradual broadening of experience and of outlook. In order that life may thus deepen, thought and imagination must be kept active so that new ideas and ideals may be received and assimilated. It is the function of spiritual art to inspire the mind with lofty ideals, to make the highest life attractive, and to impart a sense of the boundlessness of life. Thus for us to-day it is to extol brotherhood and spiritual life, to reveal the great heights of spiritual attainment man is capable of.

Physical art delights; but spiritual art inspires; and in order to live well one must needs be constantly inspired by the highest art. Physical objects are beautiful, but beautiful only; whereas man is virtuous, heroic. And spiritual art is heroic art. Thus spiritual art is life's interpreter, and teaches man how to live heroically, vitally. Spiritual art is the revealer of life at its highest level. As we have said, work tends to imprison man in a world of matter and sense. Spiritual art is man's surest deliverer from such prison-house, the light which can guide him to the larger and grander world of thought and spirit. In work a man is necessarily confined to a small portion of being, but in art he touches, sees, feels and grasps,—the entire universe of being. And unless a man's mind is refreshed with the larger vision of art he will become a pigmy or a castaway, while his work will deteriorate into a mere means of getting bread. To work without the inspiration of great art is to live in a dungeon; it is to be like the zoologist of whom it is said that after spending the greater part of his life putting things into bottles, ended by putting himself into one. Unless a man frequently steps into the loftier world of art he can never know truth, or realise the highest life. Art keeps the spirit fresh and young with visions of the beautiful and the good, and so keeps alive the passion for life, for deeper and richer experience. And in his work-life man tries to establish the truth, the relationships, which thought has created and art has revealed to him. Art, therefore, need offer no apology for its existence.

Thus the life-process goes on in a never-ending cycle, while the life-stream deepens all the while: first there is work, then play:

play leading to work, production, expression, and work leading to play, participation, appreciation. Accordingly it is not true, as some writers say, that play is mere effervescence; the using up of superfluous energy—as if art were a luxury that could be dispensed with. It is quite true that a man improves his status, and increases his chance of making livelihood, in play; but play has a spiritual and life value as well, being, indeed, a vital mode of life, a form as well as condition of well-being. Play is the freeing of superfluous energy: but it is something more; it is physical recuperation and spiritual inspiration, that without which we cannot live as we ought to live. Thus to say that play or art is the mere means of guaranteeing existence, or the continuity of existence, is absurd.

And because play is a mode of life, and is of many kinds, it follows that it ought to be thought about, brought within the domain of conscious life. Too many people allow their play-life to be governed by others, by custom, whereas play above all things ought to be self-chosen suited to individual need. The needs of the soul are many, and in every case they require individual treatment. A book that helps one may not help another. To play football every day, or every week, simply because it has become a custom, may be an oppression, and do more harm than good. The sportsman who is nothing but a sportsman will soon cease to be even a sportsman. And the man who participates in only one kind of play can never be a complete man; he is sure to be dwarfed somewhere. If a student is nothing but a student he will be almost sure to possess a philosophy as deformed and unhealthy as his body.

Thus the four function of play described in the present article are not meant to apply to four levels of experience, but to the varied needs of every individual. There are times in the life of every man when he needs absolute rest; when he needs the bracing energy and physical exhilaration of sport; when the spirit calls for the delights the softening influence of beauty, and for the inspiration of heroic air. And unless thought govern play how can we expect that leisure will be well spent?

Life is a process of growth for the attainment of life; but it cannot grow without thought. In that process work and play have essential functions, and presuppose

one another. The ideals which work is the effort to realise have their origin in play, in art. Play takes man back to the ideal, to the point of view of the whole, and inspires him with a desire to realise the highest. Thus in play the self is realised in finer and larger unities. So that through work and play man comes nearer and nearer to the ideal of the perfect man. In

art the soul is born anew to the highest life; and by means of the inspiration of that ideal an attempt is made to objectify it in the world of fact. And so man moves upward from unity to unity, from harmony to deeper harmony, from truth to wider truth, all the while broadening and enriching his experience, deepening the well of his being.

THE PINCUSHION

BY WILLIAM LE QUEUX, AUTHOR OF "FATAL FINGERS,"
'THE RIDDLE OF THE RING,' &C.

[All Rights Reserved.]

IT happened in Belgrade, the Servian capital, just prior to the outbreak of the Balkan war.

The fortress-town was full of spies, mostly Austrian or foreigners in Turkish pay, while the Servian Secret Service was busily engaged watching their movements.

I had been sent poste-haste from London to watch the trend of affairs, and furnish confidential reports to Downing Street. Fortunately, I was well known, and had many friends in Servia; hence no surveillance was placed upon my movements, a very real boon, for the secret police system in Servia is even more rigorous than in Russia.

At the Grand Hotel, a comfortable place with a large, noisy cafe beneath, where politics are discussed day and night, nearly all the visitors were either representatives of the great European newspapers, adventurers eager to obtain orders for war material, or foreign spies. Each evening, when at the big *salle-a-manger* we sat down to our "pilaf with paprika," we were a strange cosmopolitan crowd waiting hourly for the outbreak of war. The excitement was intense; the war fever burned fiercely.

A strict censorship having been placed upon all telegrams, secret messengers crossed the Danube each evening and de-

spatched information from Semlin, the frontier town of Hungary. The man I employed was a pig dealer, whose habit it was to cross into Hungary frequently. Therefore he passed without suspicion with my cipher messages, addressed to a certain code word—which must be nameless—and simply "London."

Among the crowd was a lean, long-faced, grey-eyed Frenchman named Raoul Lemoine, a man I had often met up and down Europe, generally at the gayer resorts, for he was an idler, and as he always put up at the best hotels was apparently a man of means.

I was somewhat surprised to find him among that jostling, excited crowd of concession-hunters and adventurers in Belgrade, for the scum of financial Europe seemed to have congregated there, and among them I noticed was more than one man with whom he had acquaintance.

He was elegant, rather dandified, and essentially a ladies' man.

Therefore it was not surprising that when, after about a week, a pretty young Italian lady, very smartly turned-out, and travelling with her maid, arrived at the hotel, that my friend Raoul should quickly strike up acquaintance with her. Her name was the Contessa di Montelupo, he told me, and she was in Belgrade because her

husband, who was secretary of the Italian Legation at Stockholm, had been appointed to Belgrade, and she expected him daily.

"She is very charming, *mon cher ami*," he said enthusiastically, as we sat together one evening smoking the exquisite "specialitet" cigarettes so dear to the Servian palate. "She has been living in Stockholm for three years, and before that her husband was in London as third secretary of Embassy. They have a villa on the sea at Santa Margherita, near Genoa, and she spends the summer there. Suddenly she had a telegram to come here and await her husband. Ah! my *cher M'sieur Trewin*," he added, "she is so cosmopolitan, so pretty, so dainty, so charming. But, alas! for me, she is married."

"Well, you seem to take her about a good deal," I laughed.

"I speak Italian. I know Italy well, so we are friends. *Voila tout!*"

Next day he introduced me, and invited me to the table where he was sitting with her.

He had certainly not overrated her. She was very charming, and spoke English quite fluently.

"Oh, yes," she laughed, "we were in London for quite a long time. We had a flat in Queen Anne's Mansions, Westminster. You know it—eh? But here in Belgrade," she went on, with a little shrug of her shoulders, "I shall never like it—never. The Balkan people are too savage, after London, Brussels, and Stockholm."

"Outwardly they appear so, countess," I replied, looking into her wonderful dark eyes. "But I assure you that in all the Near East you will not find so many friends as in Servia."

"Yes, half-a-dozen times, and I have always regretted leaving. Their exterior may be rough, but many a warm heart beats beneath a sheepskin," I said.

"Well," she asked, suddenly changing the topic, "will there be war?"

"Who knows," I said.

"The outlook seems more peaceful to-day," Lemoine remarked. "I met Marcovitch, of the Foreign Office, an hour ago, and he says that the Porte is climbing down. Montenegro is defiant, and threatens to declare war."

"If she does, then the match will be applied to the magazine," I said. "But I hope that King Nicholas will be judicious and act diplomatically."

"My dear friend," laughed Raoul Lemoine, "King Nicholas is well aware of what has been arranged. All is ready. Bulgaria, Servia, Greece, and Montenegro, the Balkan Allies, mean war. The secret treaty was signed two years ago, and Turkey, with all her spies and her clever diplomacy, remained in ignorance; the diplomacy of Turkey has been asleep."

"Ah! *m'sieur*," exclaimed the pretty countess, "you are, I fear, very anti-Turk."

"I admit it, my dear lady," he replied. "All my sympathies are with my friends the Servians."

"And Bulgarians," I added.

"Of course—they are allies," he said. "And if war comes, Turkey will most certainly be beaten. The opposing armies are massed on either side of the frontier. At any moment they may come to grips."

"And then Heaven help Turkey," I remarked.

He smiled, and nodded a mysterious affirmative.

That evening, and during the next day, and the next, I constantly ran up against the countess, either in the hotel or in the streets, and she was always very sweet and charming.

One afternoon, Semoine having gone somewhere into the country, after luncheon I accompanied the countess for a walk in the Kalemegdan Garden, the pretty public park which, high up, overlooks the Danube.

We were strolling together beneath the half-bare trees—for the leaves had not yet all fallen—chatting upon various subjects. She was all curiosity to know what had brought me to Belgrade at such a crisis, declaring openly that I could not be travelling for pleasure.

My business was my own affair; therefore, as I strolled at her side, I replied:

"I am always fond of excitement, countess. I am not a busy bee—only alas! one of the drones."

"An idler—eh? Well, idling is usually pleasant."

"If one idles in pleasant places and with pleasant companions. Belgrade to-day is the reverse of pleasant. Don't you think so?"

"Yes. I sincerely hate the place already—I, who may have to live here three years or so! That is the worst of diplomacy—one can never pick and choose. My hus-

band's next step will be a Legation—in South America, I expect."

And so she gossiped on, sometimes speaking in French, sometimes in English.

"Your friend, M'sieur Lemoine, is a very charming man," she said presently.

"What is he?"

"An idler, like myself. We meet at all sorts of places. Usually we are together in Nice in winter, and in Deauville in summer."

"How delightful to be one's own master. I wish Leopoldo were his own master, and could travel hither and thither."

"You would then have a much better time—eh?" I laughed.

"I think so," she admitted.

Suddenly, as we turned a corner in the leafy avenue a strong wind caught her cravat of cerise crepe de Chine—a colour which suited her admirably—and carried it away.

I dashed after it and succeeded in regaining it, whereupon she asked:

"Have you a pin?"

"I am awfully sorry," I replied with regret.

"Ah, you men never have," she said. "You never carry pins until you are married."

"We seldom require them," was my answer, and we laughed together.

She possessed an inexpressible charm, and no wonder Raoul Lemoine had become fascinated by her. But at any day the count might arrive, and then my friend's society would no longer be required.

The city was in great turmoil that day. Soldiers were marching in every street, and heavy field guns and ammunition waggons rumbled over the cobbles on their way to the Turkish frontier, while the excited crowds looked on and cheered.

For a full hour we walked along the bank of the Danube in the warm autumn sunshine, and then returned to the hotel where I left her, as I had to meet in secret an official in the Ministry of Foreign Affairs who sometimes furnished me with confidential information which, in due course, I sent across the river to be telegraphed in cipher from Hungarian territory.

It was not till near midnight that I returned. I had dined with Muller, the second secretary of the German Legation, and we had played bridge afterwards. The political situation was as strained as ever, indeed there was a rumour in the

cafes that Montenegro had discarded the counsels of Servia and Bulgaria and had attacked the Turks outside Sentari. But this report was, yet, unconfirmed.

The excitement rose to fever-heat. No one slept in Belgrade that night.

When I entered my room at the hotel and switched on the light I saw attached by a ribbon to the side of the toilet-mirror a pretty pincushion of pale blue silk about three inches square.

I took it down and examined it, finding it well stocked with pins.

It did not need very much guessing to know who had placed it there, and next morning, meeting the countess in the first floor corridor—my room being on the second floor—I thanked her for her kind thought.

"Pins are always useful, even to a bachelor," she laughed, as she descended the stairs dressed to go out, for Lemoine was, I saw, awaiting her below.

That day passed in hot, feverish anxiety, and the next day, at noon, an official despatch was received from Cetinje.

War was declared!

On the day of the declaration of war by Montenegro, the Servian Army, together with their Bulgarian brothers, moved south towards Macedonia, the ill-fated country which formed the bone of contention.

A week went by. The Balkan Armies were already in touch with the enemy, and war was being waged all over the Peninsula with heavy losses on both sides. The Greeks were attacking the Turks on the one hand, while the Servians and Bulgars were on the other. The smiling, peaceful rose-fields of Kazanlik, where the true otto-of-rose is distilled, were bathed with blood.

I sent information home to Downing Street daily with the sanction of the Servian Foreign Office, entirely independent from the despatch of our Legation, but as the days went by the outlook in Belgrade seemed to grow more gloomy.

As the Count di Montelupo was still detained in Stockholm the contessa remained at the hotel, and frequently entertained Lemoine and myself in her cosy little salon on the first floor.

Her little pincushion I often used, for I had somehow lost the box of paper-fasteners from my despatch-box, and was compelled to use pins instead. I told her this, and she replied:

"Did I not prophecy that it might be useful?"

It was no business of mine, of course, but I could not fail to see how friendly she and my friend Lemoine were becoming.

They were always chatting together confidentially.

One evening while I sat with them, smoking and gossiping as usual, a waiter entered saying that he had shown a gentleman up to my room.

"He is the gentleman you told me of, m'sieur," the man said. "He gave the name of Shaw, and I have taken him up, as you ordered this morning."

"Quite right," I said. Then turning to my hostess, I begged to be excused, and ran quickly upstairs, two steps at a time.

In my room stood my friend and colleague, Dick Shaw, of the Secret Service, still in his heavy travelling-ulster and wearing a soft felt hat.

"Hulloa, Dick, what's up?" I asked anxiously. "I got your phone message from Sofia."

"Lock that door, old chap," he said. Then he glanced around at the walls suspiciously, and asked:

"Can we be heard in the next room?"

"No. I'm always careful to choose my rooms in hotels, as you know. But what's up. Something is wrong. I can see by your face." And I crossed to the dressing-table near which he was standing.

"Wrong!" he echoed. "Why, Serbia is let into a fatal trap over this war. In Sofia I found out the whole truth last night, but I dare not wire it to London. It had better go through you into Germany. We must not put it on the Austrian wires."

"What do you mean?" I asked, staring at him in surprise.

"Simply this. Serbia and Greece believe in Bulgaria, but she has already betrayed them into the hands of Austria. A year ago a secret treaty was signed in Vienna and Sofia which provides that, after the present war, when Serbia has been weakened, Bulgaria will turn against her on the one side and Austria on the other, and crush her out of existence. Austria is to annex Serbia, and, assisted by Bulgaria, will attack Greece, which, when conquered, is to be merged into Bulgaria."

I stood aghast.

"Are you quite certain of this?"

"Absolutely. I have a copy of the

clause in question," and from his pocket he took a sealed envelope, which he broke open, and then proceeded slowly to read. Clause XV. of the Secret Treaty.

The situation in the Balkans was now hopeless. War had already been declared. Had we discovered this startling diplomatic secret—this plot against Serbia—a fortnight ago we should have told the Servian Prime Minister the truth, and Serbia would have refused to enter the alliance, or fight for the honour of her betrayer.

I confess the news was so astounding that I stood before him speechless. It was a secret which, if divulged, would in all probability result in a European war.

"Not a breath of this must get out, Shaw," I said at last. "You return to Sofia, and I will go direct to London tomorrow and lay it before the chief. We must not trust it, even in code, to the wires."

"I quite agree," he said, handing me the copy of the all-important clause in the Treaty.

I then sat down at the little writing-table, and, taking a piece of despatch-paper from my steel box, wrote a memorandum of our conversation. Then, taking a pin from the countess's cushion, I attached it to the sheet of paper, whereon was written the wording of the secret agreement.

Afterwards I sealed it and placed it in my breast pocket, ready for conveyance to Downing Street on the morrow.

"How did you manage to get hold of it?" I asked as I re-locked my despatch-box.

"Money—my dear old chap. A particular friend of mine—a secretary in the Ministry of Foreign Affairs in Sofia—is a gambler. You know the rest. A few bank-notes and the trick was done—as in so many cases."

We went below to the cafe, and half-an-hour later Lemoine joined us, and remained for some minutes. Then he rose and went out.

"Who is that fellow?" Shaw asked when he had gone.

"Oh! a wealthy man. I often meet him about," I said carelessly.

"I've seen him somewhere. His face is familiar to me, but for the life of me I can't recall him." Shaw said. "I met him somewhere in circumstances that were suspicious and of that I feel certain."

"Where?" I asked.

"Ah, that I unfortunately can't recollect. I travel so much, and meet so many strangers, that it's quite impossible to remember everybody."

"He's quite a good fellow," I remarked.

"He may be," sniffed my friend, "only don't trust him, Trewin. If my memory serves me aright I once regarded him with some distinct suspicion."

His words caused me to reflect. Yet I had known Raoul Lemoine a long time, and beyond the fact that he was such a squire of dames, I really knew nothing to his detriment.

The Orient express would not leave Belgrade for Ostend, I found, till ten o'clock next evening. So not until two o'clock did we part, and Shaw, who had engaged a room, retired to bed, an example which I followed.

Shaw left at eight, and returned by a military train to the Bulgarian capital, having received an official permit to do so.

Just before eleven o'clock next morning, while packing my bag ready for my journey, there came a tap on my door, and next second I was face to face with my friend Damilovitch, chief of the Servian secret police, who wore a smart dark blue uniform, with the cross of St. Sava at his throat.

"Ah, my dear M'sieur Trewin, how are you this morning?" he asked, greeting me warmly in French and gripping my hand.

I welcomed him, and when he had shut the door he said:

"I have called to ask you a question or two. You are always such a very good friend of Servia that I know you will answer them."

"Of course—anything in the interests of your country and your king."

"Then tell me what you have discovered regarding this conspiracy of Austria and Bulgaria against us?" he asked, looking me straight in the face with his dark, deep-set eyes.

"Conspiracy!" I echoed. "How do you know? First tell me that, Colonel Danilo-vitch."

He smiled and, watching me, said slowly:

"Your friends Raoul Lemoine and the Countess di Montelupo seem a rather interesting pair."

"I don't follow you."

"Well, early this morning—at half-past

four to be precise—they both endeavoured to leave Belgrade in secret. For some weeks past observation has been kept upon them, with the result that when on the landing-stage and about to embark on the early boat for Semlin they were arrested and brought to the bureau of police for interrogation."

"But was it judicious?" I gasped. "The countess is wife of a diplomat—the second secretary of the Italian Legation."

He smiled again.

"So she says, my dear friend. So she says," he answered. "Well, I had them both searched, and, just as I suspected, both were spies in the pay of Turkey. In the pocket of the man was found a report giving the record of a conversation which you had last night with a friend of yours, M'sieur Shaw, and details of an extraordinary Secret Treaty, signed between Bulgaria and Austria, to annihilate us. Is that a fact?" he asked with great concern.

"Strictly between ourselves, I can assure you, colonel, that the Secret Treaty actually exists."

"Are you positive?"

"I am, though as you can see it is most unfortunate. Not a word must leak out concerning it. I will see Monsieur Rackitch as soon as he will see me, and show him the copy of the all-important clause which is designed to wipe Servia off the map of Europe."

"Did you tell this to Lemoine?"

"Certainly not. How he could know is an absolute mystery. Beyond the four walls of the room no sound could penetrate. I was very careful to ascertain that. The walls of Belgrade have ears."

"The door?"

"There was a heavy portiere curtain over it. No. I am confident that no sound could have been heard outside the room, and certainly nobody was present at the interview except Shaw and myself."

"Well, here is the report," he said, as he drew from his tunic the closely-written sheet of paper, upon which every word of our conversation had been carefully recorded.

How it could have been obtained was a complete mystery.

"It is indeed fortunate that this did not get outside Servia and into the enemy's hands," I remarked.

"Yes. They were arrested just in the

nick of time," Danilovitch replied. "You will note that the report is addressed to Saba Pasha in Trieste."

"I see it is. Saba is a well-known Turkish spy."

"Of course. So there is no question as to the character of your interesting friends," remarked Danilovitch. "It is fortunate that you have discovered the truth regarding the conspiracy against us, which. I hope, you will expose to the Prime Minister at noon, and equally fortunate that the two spies are under arrest. Remember, M'sieur Trewin, we are now at war, and the pretty countess and her companion are spies of our enemy."

I held my breath. That fact had not occurred to me.

"The court-martial upon them will be held with closed doors in the fortress this afternoon. Death sentences only can be pronounced upon spies in time of war!"

At five o'clock that same afternoon I was called to the telephone, and Danilovitch told me the sentence in each case—death!

An hour later, however, I received word that King Peter had exercised his clemency and reduced the penalty to imprisonment for fifteen years—a sentence which the pair are still undergoing in the fortress at this moment, while by the result of Shaw's discovery Serbia, being forewarned, was able to thwart the disgraceful plans of Bulgaria and Austria, and by exposing the plot to the Powers demand measures for her own security.

The public, when it read in the newspapers of all the Balkan complications, never dreamed that Serbia owes her present security, nay, her very existence, to the pretty little pin-cushion presented to me by the "countess."

The discovery I made was certainly an astonishing one, for when on that night, when sentence was pronounced, I packed all my traps before leaving post haste for England, I took down my pincushion and, to my surprise, I found that another had evidently been substituted since I had first examined my present.

The one I held in my hand seemed unusually hard, and on inspecting the back closely I found that, concealed beneath the thin blue silk, was a cunningly contrived telephone receiver, of what is known as a "watch" type.

To it was attached an insulated wire so fine as to be practically invisible, which passed out of my window with its loose end hanging down to the window below—the room which had been occupied by the "countess!"

So, while Shaw had been explaining the secret to me and reading the clause of the Treaty, the ingenious spies of Turkey had been taking it down.

Yet, after all, Serbia was saved from utter destruction by the innocent-looking little blue pincushion which, as I write, lies upon my table, a mute relic of a turbulent day, and a reminder that two charming persons are immured in the Fortress of Belgrade, and are, I fear, likely to remain there for some years to come.

THE RELIGION OF HUMANITY AND SIR HENRY COTTON

BY W. F. WESTBROOK.

[A commemoration service for the late Sir Henry Cotton was held on Sunday, 14 November, at the Church of Humanity in London (19 Chapel Street, Lamb's Conduit Street, W. C.), and after the usual prayers, and readings from the Imitation of Christ and the Bhagavadgita, the following discourse was delivered by Mr. Walter Francis Westbrook.]

WE offer this morning our collective tribute of respect to Sir Henry Cotton, our fellow-Positivist and

member of this Church of Humanity. He passed away at his home in London on Friday, 22 October, at the age of 70 years: his body was cremated at Golder's Green on Monday, 25 October; and on this, the third Sunday after that ceremony, as is our wont, we hold here, in our regular place of worship, this Service of Commemoration. I shall speak to

first of the scope and intention of this Memorial Service, next of the life we are commemorating, and then of some Positivist views on life and immortality.

I.

This religious service of to-day is one of simple friendly commemoration of him. That is to say, it is not to be regarded as the considered religious judgment of the Church upon him: that is for the future, and it should come, with due authority, seven years hence, in the Sacrament of Incorporation, as I will explain. It is part to our Faith that all Positivist life should be lived on religious principles, under religious sanction, and with definite ordering by the Church. With this in view, our Master, Auguste Comte, instituted for us a series of nine Sacraments, arranged to cover our life from birth to death and after: these Sacraments are:—three of early life, Presentation, Initiation, Admission, into the Church: then Destination, to social function: Marriage: Maturity: and three of later life, Retirement, Transformation, Incorporation. These Sacraments are all voluntary, of free acceptance. In this way each successive phase throughout our individual and private life is connected with our public life, through consecration by the Church, each phase is well-defined, each is preparatory for the next one, each naturally implies definite duties and obligations, each receives a due religious sanction. The religious experience of all Churches concurs as to the importance and helpfulness of such ordinances. For our purpose today, I refer to the three of later life. By the Sacrament of *Retirement*, which is usually at the age of 65, the Church marks the normal ending of complete and direct active work: the citizen of his own will withdraws from activity, in order, among other things, to have free scope for his rightful influence as an adviser, which is a social and spiritual function. The sacrament of *Transformation*, at the time just before death, will naturally vary according to circumstances. It is at the wish of the dying person, and it is usually a family consecration. Dr. Richard Congreve says of it: "Those who have profited by the preceding Sacraments will wish for this one to complete the series with their own consciousness. As human life gets more orderly and settled and less subject to premature shortening, this act of

acceptance of the fatality of death, its deliberate acceptance, recognition of its usefulness socially—an act of resignation—will dignify and consecrate the close of our objective life and the entrance upon the existence which has been the object of that life's exertions." And then, in the Sacrament of *Incorporation*, seven years after death, when all disturbing passions are sufficiently quieted, the Church pronounces a solemn appreciation and judgment upon the life, and proclaims its incorporation into the great life of Humanity, and inaugurates an appropriate memorial.

You will see, therefore, that today's Service is not Sacramental, nor authoritative: it implies no judgment, and it is purely provisional. It is but the natural continuation of the simple funeral ceremony of three weeks ago, offering us this congregational way of expressing our human feelings—our tribute of honour and respect to one of our brethren, on behalf not merely of our own group here, but also of that larger number of his fellow-believers and friends, in more or less close connection, who would wish to be associated with us in this tribute.

II.

Let me bring to your minds, briefly, the salient facts of his life. Henry John Stedman Cotton was born on the 13th of September 1845 in India, where his family for three generations had been connected with the Civil Service. He was brought to England in 1848: went to school in Oxford and Brighton, and came to King's College, London, in 1861. His Education was in classics, with history and literature, and he especially followed theological studies. He has himself told us of the brilliant professors under whom he was trained, and he has described the capable and interesting set of fellow-students among whom he moved. With one he was especially intimate, Professor Evan Baxter. In 1865 he passed for the Indian Civil Service. Then came two years of preparatory studies and social life—two full and glorious years in a fine circle of friends—two golden years, he called them—which he enjoyed to the full. It was in the spring of 1867 that he attended with Dr. Baxter some lectures on Positivism given in London by Dr. Richard Congreve: the Religion of Humanity was a revelation to him. He was married

on the 1st of August 1867—he was young, not yet 22: and on 23 September 1867 he and his wife left for India overland arriving at Calcutta on 29 October 1867, Mrs. Cotton's birthday. Then ensued 35 years of distinguished official duty. He served in the Bengal Revenue and Judicial Departments, became Assistant Secretary to Government in 1875, Assistant to the Board of Revenue 1882. While holding that office he published, in 1885, his book "New India" of which I shall speak presently. He became Chief Secretary to the Government of Bengal in 1892, and was made C. S. I. In November 1896, he was appointed Chief Commissioner of Assam—an office which he held until his retirement from the Service in 1902: his Government in Assam was especially marked by the great earthquake of 12 June 1897, which destroyed his headquarters at Shillong, and in 1901 by serious difficulties over the indentured labour question, wherein he strongly took up the cause of the labourers, and was most violently attacked for his policy. In April 1902 he came to England on leave prior to retirement: he left India amid great popular demonstrations of respect and affection. In June 1902 he was knighted by the King and invested as K.C.S.I.: in October 1902 he retired from the Service on pension. Then he was at last free—his own word is "unmuzzled"—free for that consultative and advisory function of which I was speaking just now.

His work for India, however, did not cease: it continued to be the main purpose of his life. He joined the Indian National Congress Committee in England: this Congress of Indian representative men had first met, in India, in 1885. He was honoured by being nominated President over the Congress (the 20th) which met in Bombay in Dec. 1904: and he then revisited India, receiving a most enthusiastic welcome from the Indian peoples: he delivered to the Congress a memorable Presidential address.

His life-work was continued also in the British Parliament. In the spring of 1903 he had been chosen candidate in the Liberal interest for East Nottingham: he was in due course triumphantly elected, and he sat as M. P. for four years, from Jan. 1906 to Jan. 1910. He held advanced views in politics; and he brought to bear on this new political life here the same high principles which had guided his

Indian period. He was assiduous and conscientious in his duties, greatly, we must regret, at the expense of his health. He spoke very warmly of the happiness of those years, and of the many friends he made in and out of Parliament, and of the grateful testimony of his Nottingham constituents. India also was his constituency: he was the leader in Parliament of the small party actively interested in Indian questions, so often treated with neglect. He brought forward important matters for discussion and freely and boldly criticized the Liberal Government policy, inevitably arousing some enmity and obloquy, but rendering notable service.

For other interests and occupations he also found time and opportunity. He was a supporter of various good causes. The Humanitarian movement, to mention but one example: he had himself never taken part in what are called field sports, nor shikar and big-game shooting: after his earliest phase in India, he says, he shrank from severe and cruel punishments: flogging, for instance, he protested against. But India was his main interest, and in her cause he was untiring.

His parliamentary life was followed by five years or more of comparative repose: years not free from ill health and incidents of older age, and troubles attendant on changing circumstances: darkened also by gloomy war, with its vast scenes of tragic death and devastation: saddened also last year by one special sorrow. That sorrow was the illness and death of Lady Cotton. Her, his life-companion, we would justly associate with him in our commemoration to-day. She passed away on the 26th of September, last year, a year and a month before him, after a conjoined life of 47 years: a life marked by those long separations which are, as he sadly says, "among the most painful accompaniments of an Indian life." They had gone out to India in 1867: two sons were born to them there, and a third in September 1874, after her first return to England: thereafter the central family home was for 40 years at St. John's Wood, in London. She suffered with him in the great Earthquake at Shillong in 1897. Those of us who have read his "Indian and Home Memories"—published four years ago when she was still with him—will not easily forget his tributes to her whom he calls 'my devoted companion and helpmate.'

through many years of vicissitudes and successes, sorrows and aspirations, clouds and sunshine."

His work and policy are matters of public knowledge and history: their high character is well known: many have been the public and private testimonies, both in the years that have gone and especially during these past days. He was by common consent an efficient, a conscientious, a sympathetic administrator: an administrator, too, who was always accessible. He was a chivalrous champion of the Indian peoples. Loyal also to the Government and to the Service: in one farewell speech on leaving India he said, "I have never ignored and shall never be unmindful of the responsibilities I owe to the Government. I have never failed in my sense of discipline. I am true to my salt." His life was lived largely in the public eye: his principles of conduct were manifest to all the world. He adhered to the teachings of his Master, Auguste Comte, that the great problem of modern political life is the subordination of politics to morals, and that devotion of the strong to the weak is a primary duty of those in authority.

I would refer to some of his own writings as expressive of these principles. In 1885 he published with great courage—for great courage it was, then—his striking book "New India, or India in transition." He there outlines a progressive policy for Indian administration. Holding that even the best bureaucracy in the world tends to become too conservative, and even retrograde, he warns the Indian Government and the public of the increasing difficulties of administration, and urges measures of adaptation to the changing circumstances. This warning, we may remember, was given 30 years ago. He presses for the encouragement of the aspirations and spontaneous tendencies of the Indian peoples, and counsels to his fellow administrators a more sympathetic and understanding attitude. He looks forward to autonomy, with a system of federated Indian States: the chief duty of Government meantime, is to keep the peace. The whole is animated by his Positivist convictions. It is pleasant to think that he lived to see, begun at least, some realization of these administrative reforms: his protests were vindicated. His continuous advocacy of these ideas, as I have already said, about his parliamentary life, often brought him conflict

and controversy, and even enmity, especially in the later years; but on these, and like matters, we need not dwell—he would not wish it: certainly he was little concerned by attacks upon himself: "I am not," he said, "a good hater."

His spirit and purposes are also plainly and openly set forth in the volume of "Indian Speeches and Addresses." This was published in Calcutta in 1903; there are fourteen of them, selected from the period between 1885 and 1902 when he left India.

His book of "Indian and Home Memories," published in 1911, is in his own words his *Apologia* for his Indian policy. It is also much more: it is a frank autobiography, written with great charm and joy of life and fine feeling: it is a precious gift of himself to us, for which we are more than grateful.

His early connection with Positivism and the Religion of Humanity I have already mentioned. He came into contact with our religion about the year 1866. He says he passed through Mill's *Essays* in the "Westminster Review" to Auguste Comte's "General Creed of Positivism" and his "Catechism of Positive Religion." "In this course of reading," he says, "I collaborated with Baxter, together we attended the lectures given by Dr. Richard Congreve at Bouverie Street, Strand, in the spring of 1867. Assembled there together was a very small but noteworthy audience, including George Eliot, George Henry Lewes, Cotter Morison, Godfrey and Vernon Lushington, Frederic Harrison, Edward Spencer Beesly, and John Henry Bridges. In later years I came to know most of these very well, and Dr. Congreve was destined to exercise a lasting influence over me through a constant and regular correspondence extending over nearly thirty years.... I can only say that Comte's writings produced on our receptive minds something of the effect that Chapman's Homer wrought on Keats": and then he quotes the famous sonnet. After he reached India, he became associated with other Positivists, and with the Indian group that, largely through his influence, grew up in Calcutta. To some of them these tablets on our walls bear witness—Dwarkanath Mitter, who died in 1874 at 42: James Cruickshank Geddes (brother-in-law of Dr. Congreve) who died in 1880, of whom he speaks with great respect and affection: Samuel Lobb: Dr.

Arthur Burnell : Guru Das Chatterji. And for many years he was associated with our dear co-religionist, Jogendra Chandra Ghosh, whose memorial tablet is here—he died in 1902. It was by special delegation from Dr. Congreve that on 20 Jan. 1884 he conferred upon Jogendra the Sacrament of Maturity. There was a small Positivist community already then established: for several years the Festival of Humanity (1 January) had been celebrated at Mr. Cotton's house, and some of Mr. Cotton's Annual Addresses on those occasions were published, that for 1888 was the seventh. In 1891 the direction of the Calcutta group passed more into the hands of Jogendra, partly owing to changes in Mr. Cotton's official position. On the Day of Humanity, 1 January 1901, Mr. Cotton gave at their meeting a memorial address on our dear friend Mr. Thomas Sulman, then lately dead.

I need hardly say that he was well known to many Positivists here in London: he came to us frequently during his furlough and he addressed us at intervals, and addressed also the other London group. But before his final return to England Dr. Congreve and other old friends had passed away, and others have gone since, and he deeply felt these changes.

I have indicated thus generally the active life of him whom we are commemorating to-day. A life, it is, complete in years—past the three score ten of the ancient Jewish singer—yet not old as men go: we Positivists look forward to a longer span as the normal. A life, it is, rich in effort and experience of all kinds. All the normal functions of our human order he has fulfilled, functions of individual being, duties of marriage and family life, of friendship and social contacts: he is for ever knit, as it were, into the great series of the generations of our race. Duties, also, religious, civic, public. "Some work of noble note" we may confidently say that he has done: he has given to us and to mankind, a notable contribution of service. This also to us and to mankind, we may surely feel that he gives—an example of high purpose, of rectitude and sincerity, of sound conviction and consistency—in short, of true service of Humanity. He lives on in the hearts and minds, not merely of all who have known him, but of a far wider and widening circle whom he has influenced—a worldwide circle.

He lives especially, we are assured, in the hearts and minds of the Indian people. "A true friend to India and her people"—such is the inscription already during his lifetime placed beneath the bust of him in the Town Hall in Calcutta.

III.

And now by Death he passes into the Great Peace. Death, we know, the death of the body, is the common fate of us all. The fundamental mystery of life itself we do not fully comprehend, for each one of us birth and death are the incidents that outwardly mark its beginning and its closing: between them is this human existence which alone we ourselves really know and within this all-important span lie our opportunities for love and thought and service. For this period of time we are manifestations of that high Being, Humanity, who guides our destinies. She, the great world-soul, bodies us forth, in an individual life, for a varying length of years: and then, early or late, with purpose fulfilled or unfulfilled, we are each drawn back to Her from whom we came. Such is the normal course of the life of man and woman on this planet of ours—it is thus and only thus—by the death of the individuals—that the continuous generations of Humanity may replace one another—each generation necessarily passing on, and preparing and making ready the way for its successor in the great collective life of man. Yes, death is one of the very laws that condition our bodily human life as children of Humanity—perhaps a law of all life.

It is, again, the last sign of our activities—the last social act possible for each and all of us.

And yet again, it is for each of us the one great inescapable thing in life.

We frankly acknowledge, for ourselves, and for our loved ones, and for all men and women, this necessity, this law of bodily death. We accept it with awe and reverence, we accept it with resignation and with calm: we would accept it also with voluntary and willing submission. We accept it to-day for him of whom we are all now thinking.

And yet, this cessation of the physical being—mournful, inevitable, just—is, let us believe, the minor matter. Not that we underrate the value of the loved bodily presence—not that we do not respect and love the dear body, but that

beautiful, highly-organized mechanism, highest in the vital series, the casket and framework of the personality, of that wondrous complex entity that we call a man or a woman. But its function, noble as it is, is yet temporary and not permanent: its service ended, it rightly ceases to be: it remains in memory, an invaluable aid to finest memory. Its outward passing renders too this other service—in that the enshrined personality thereby goes through a process of exfoliation, of emergence. The passing and trivial elements, the temporary and even negative characteristics, drop away; the spiritual and abiding and real things are left, pure and unalloyed. It is as in the Purgatorio of Dante's poem—there are the waters of Lethe first, and these are followed by the waters of Eunoe. Siva the Destroyer is also Siva the Transformer, he who presides over the transformation.

So that we may say that in the spiritual meaning there is *no death*. Decease is a point of dramatic *fixation*: only in a partial sense can it be said to be an *end*. "Non omnis moriar" should be our hope: "I shall not wholly die." In this view there is no death; what seems so is but transition—Transformation our sacrament calls it—transition to the finer form of life, the spiritual and subjective life. Indeed, if we take a long perspective, the whole course of our human living is but the continuous passage from the objective to the subjective, from the material to the spiritual—the physical factor ever diminishing, the spiritual crescendo. The real efficient part of living, even during life, consists in *spiritual* effort and attainment and influence. This, true of men and women, is true also of Humanity Herself.

While then, in the immediate present, in the newness of our public and private loss, we cannot but mourn—callous indeed and less than human did we not—let us have confidence that the other and finer feeling will gradually gain power over us, and that rather our mourning shall be turned into joy. We shall think of life rather than of death. We shall rejoice that he lived and wrought, rejoice that, though he passes on, his life abides with us and in us, continuous, spiritualized, an active living force still; and that we and India and the world are the richer by his high example.

Henry Cotton, then, joins the vast

immortal company of those who have entered upon that other and further stage of living: he is become one of those our Master, Auguste Comte, calls "*La grande Priorite*" of Humanity—Her ever increasing majority. In Humanity alone, as part of that vast company, is his immortality, and in Her alone can be our immortality. She alone is: he and we through Her. She is the relatively permanent and enduring life on the planet, not we Her separate children. We, the individuals of our generation, to-day are here, and to-morrow are gone: we are but the temporary manifestations of Her, and She alone abides in perpetuity. "The One remains, the many change and pass." All we have of immortality is not in ourselves, but in and through Her.

And he joins also—we especially feel, we Positivists of the nascent church of Humanity—he joins also the company of those who died in the Faith. To some of that sacred company our walls bear witness in these tablets that look upon us in our worship: his name will be added to theirs in this shrine of memories and seven years hence will be the due season for the final sacrament of Incorporation. He is our elder brother in the Faith of Humanity. In Her faith and by Her impulse his life was guided. "Live for others"—"Live openly" were his religious principles of conduct. Let us follow in spirit his high example. Like the old Greek runners with the lighted torch, he hands it on to us to carry forward in our turn. He felt and acknowledged the inspiration of Humanity: to us as to him Her voice comes "*I am always with thee*"; let us, too, hearken to it and be moved by it to noble service. Inspiration, stimulus, these we do sorely need. This has been the constant demand of the human heart, that there be vouchsafed a fuller spiritual insight, a deeper feeling of the immanence, the indwelling of the Supreme Power and Supreme Love that guides our lives. And we—not less but more than those of the older faiths do we Positivists need to feel this power—the power and love of Humanity—working in and through us. As says the Imitation of Christ "love feels no burden, thinks nothing of trouble, pleads no excuse even of impossibility: it is therefore able to undertake all things: yea, and it completes many things and warrants them to take effect. Where he who

does not love would faint and lie down." The inspiration of Humanity would enable us to dare and to do things apparently beyond our individual powers. Only under this high influence can noble life be lived. We cannot attain our finest

life unless we feel ourselves consciously to be the agents and instruments of that higher power—unless we feel glowing within us the love and inspiration of Humanity.

In Her Will, be our peace.

THE INDIAN THEISTIC MOVEMENT AND ITS PROBLEMS

BY THE HON'BLE DR. NIL RATAN SIRCAR, M.A., M.D.

THEISM IN PRIMITIVE RELIGION.

IN one sense, and that perhaps the truest and best, Theism is the most ancient religion of the race. In fact, it is co-extensive with religion. For it is coming to be perceived more and more that the most primitive tribes had an instinctive feeling of an indefinite and nameless presence in the more unusual manifestations of nature, as well as a feeling of inviolable sanctity in the bonds of tribal custom, before they conceived separate gods or ancestral manes; and that among these, again, the greater gods, usually with one greatest among the great, claimed the worship of man, before the multitude of lower deities, whether believed to be benevolent or malevolent. Thus through the ages, in the corridor of primeval history, were heard the footsteps of the coming Deity. What we have hitherto despised as Fetishism, Animism, Spiritism, even the jungly undergrowth of animistic, mimetic, sympathetic magic, are now seen to have been vital, not noxious, growths in the evolution of the social life: indeed, they were something more; they stood for man's perception of a Something beyond the veil of sense, some supernal manifestation of life and power, however dimly and grossly the symbols of that power might have been conceived.

THEISM AND IDOLATRY.

This is, not an idle scientific belief, a theoretic result of our comparative or historic studies in Religion, but a potent practical principle in our dealings with other faiths and cults. Polytheism and idolatry, nay, even the grossest forms of animistic belief, are seen to be normal

products of undeveloped minds, and, in the beginning, healthy and constructive when they were not anti-social. They have been outgrown in the march of the human mind and spirit, but there is no room for the intolerant and ignorant attitude which conceives them as inherently false, sinful and perverse. In fact, the religions of Nature or of Natural instinct may contribute certain pluralistic and symbolic elements to the theistic religion of the future.

THE CATHOLICITY OF INDIAN THEISM.

Indeed any such intolerance in a body of Indian Theists would be an aberration specially alien to the Indian mind. That handbook of Hindu Theism, the *Kusumanjali*, for example, acknowledges that the heretics in their worship of Reason, of an impersonal Intelligence, or of the Perfect Man, and even the rude mechanics in their worship of Vishwakarma, are seekers after the one Great God and, as such, included in the fold of Theism. Let us lay that great saying to heart.

CONTRIBUTIONS OF ANCIENT RELIGIONS TO THE THEISTIC RELIGION.

We, Theists in India, then, with our tradition of religious toleration and catholicity dating from beyond Asoka, must make a world-religion of our faith, seeking to fulfil and not destroy all the faiths by which man has lived and died in any age or clime. Vedic and Hellenic polytheism will restore to us the lost sense of Nature, our natural piety, our kinship with the flowers, the rivers, and the mountains, our hope in the illumination of the dawn and our strength in the splendour of the charioted Sun. The Avesta will renew in us the sense

of wonder and awe and mystery with which Humanity in the freshness of youth watched the rising and the setting sun, and the daily renewed struggle between the powers of Light and Darkness in the Heavens, and teach us the cosmic significance of the struggle between good and evil desire in the heart of man, calling us to enlist ourselves as votaries of Ahuramazda the good, in the march of the world. The pagan Roman with his house-hold gods, and the Japanese with his Shinto, will yield to us the sense of oneness in the generations of man; the sense of an ancestral and social solidarity.

THE HISTORIC THEISMS: THEIR CONTRIBUTIONS TO THE FUTURE RELIGION.

The great historic Theisms of the world, whether Christian, or Islamite, Vaishnavic or Shaibaite, will each bring to us new stores of reverence. One will teach us the sanctity of sorrow and suffering and the central need of sacrifice for the uplift of the poor, the oppressed and the fallen. Another will teach us a burning sincerity as of the sandy deserts of Arabia, the simplicity and single-mindedness of putting the Divine Will above everything else, and the secret of putting aside the trappings and garnishings of life and burning them up in an overmastering, perhaps even a fanatic, enthusiasm. A third will help us to accept life as the *Lila* or Play of Love, and to find in wife and mother, in friend and servant, the one Divine Lover, the infinitely great stooping to be infinitely little, to love and be loved. The fourth will teach us the secret of Yoga, of communion, meditation, contemplation, in one word Peace, amidst the storm and stress of an apathetic and even a hostile world. Our closest spiritual affinity however is with the religion of the Upanishads, those prophetic utterances of the ancient seers of India, for whom the dawn of thought illumined the abysmal depths of the spirit and to whose vision the world was first revealed under the form and superscription of Eternity. In these Upanishads meet the transcendent and the immanent in an original intuition, which is creative of Reality, an intuition which is at once the mother of religion and of philosophy. But, indeed these great historic religions cannot be thus exhausted of their contents; for they are not partial phases of the consciousness of man,—expressing

as they do the whole of man's life on the natural and instinctive as well as on the ethical and the spiritual levels. They have a many-sidedness, an adaptation, and a flexibility, which are apt to be wanting in the creations of personal idealism. Thus it is that the historic religions are rich in symbols which appeal to the imagination and the artistic sense; they clothe the eternal verities with authority in the form of religious dogmas, and in their ceremonials and festive aspects they satisfy the social sense, the instinct of companionship and play, binding together their votaries in communal bonds. But, above all, they wield power over the masses, the simple unlettered multitude, ministering to their needs of consolation here and hope hereafter.

THE PROBLEM FOR OUR UNIVERSAL THEISM: HOW TO BECOME HISTORIC AND CONCRETE.

The historic Theisms, then, whether Hindu or later Buddhistic, Christian, Jewish or Islamic, have their advantages over the universal Theism we profess, and unless the latter consents to enrich itself with the blood of Humanity by becoming historic and concrete in its turn, it will always be in the air, as it were, an idea, no doubt a governing idea, in personal conduct and practice, but hardly a religion swaying the lives and destinies of masses of men.

THE PAN-HISTORIC CHARACTER OF INDIAN THEISM.

But Indian Theism in its effort to become concrete, historical, in one word, national, has the whole world of religion to draw from. The history of the religions of India is in a special sense world-history.

ILLUSTRATIONS FROM HINDU THEISM.

Confining ourselves to Hindu Theism, it will be found that this Theism has assimilated elements of life from the most diverse cults and beliefs. Indian *Bhakti* (Devotion) is certainly indigenous, going back, as it does, to the Upanishads, with their recognition of *Varana* (Election), *Anupranana* (Inspiration), *Prerana* (Adesha) and *Prasada* (Grace); but whether in the earlier *Bhagavata Pancharatra* forms, or in the later Ramanujist revival, it has been in profitable (and stimulating) contact with Christian elements, specially the great ideal of a Redeeming God. Again, the Theistic

Bhakti movements of Northern India, in the fifteenth and sixteenth centuries, incorporated much of the simple monotheism and ethical severity and seriousness of Islam together with the democratic force which makes Islam essentially the religion of the masses. Indian Islam and Indian Christianity have in the same way been vitally influenced by the great ruling ideas and ideals of Hindu Theism.

INDIA, THE RELIGIOUS CUSTODIAN OF FUTURE HUMANITY.

Indian Theism, in the past, has therefore been pan-historic in its sources and inspirations, and will be increasingly so with our modern cultural environment. This makes India in a special sense the religious custodian of future humanity. For it is becoming increasingly clear to the best minds of our age that the religion of the future will have the same pan-historic character, and that Buddhism, Christianity, Hinduism and Islam, as four phases or embodiments of Religion, will each have a place in the collective Religion of the Race.

NATIONAL RELIGIOUS RECONSTRUCTION— THE TASK BEFORE INDIAN THEISTS.

That is the task before us—a work of religious reconstruction of the first magnitude. We have been content in the past to divest the Theistic faith of its supernatural, irrational, and non-moral wrappings in its various historical forms. We have also breathed a new life, progressive social ideals, democratic vistas, and a universal religion, into the old bodies of faith and tradition; but now that, with all these gains in modernity, we are entering on a more constructive Theism to-day, we must, following in the footsteps of our father and founder the Raja Rammohun Roy, again seek after God in history, God in the scriptures and the histories of the Nations—in other words, we must seek inspiration afresh from the historic Theisms of the world, that we may give a concrete historical Theism to our age and country.

THE NEW AGE IN RELIGION : THE SPHERES OF RELIGION, PHILOSOPHY, SCIENCE AND ART.

Our own age : for our age has brought us a new religious idea, almost a new religious sense. It is not merely that religion is no longer divorced from Science, Philosophy or Art. Each of these, it is now

seen, deals with experience as a whole, each seeks to reflect the universe-idea, or the idea of the absolute, though in different facets or from different angles. Science seeks to reduce all phenomenal experience to the unity of a system, proceeding from multiplicity to unity. Philosophy studies every concrete bit and fragment of experience in its relation to every other bit in the light of the whole system of experience, seeing in the phenomenal world the image and reflection of Eternity. Religion and Art also deal with experience as a whole, but not in a theoretical sense; they are both constructive and practical. But of the two, Art individualises the Universal, Religion universalises the individual. Art expresses the Universal in concrete modes and symbols, and projects all experience, even subjective experience, in an objective form. Art, in other words, creates outer symbols for the inner life. Religion is also creative, as creative as Art, but it creates the Universal out of the Individual. And it is primarily subjective, for the individual whom religion seeks to universalise is the universal subject. Religion is therefore in the first instance self-creative, and even where it seeks to create a Kingdom of God in the social community or the State, that kingdom is the kingdom of the Spirit, not of the Flesh.

MID-VICTORIAN SUBSTITUTES FOR RELIGION —MIXED RELIGIOUS TYPES.

It follows at once from the above that Science, Philosophy, Art and Religion are co-extensive in their spheres. Religion must not comprise any matter of fact or law relating to Nature or History which is repugnant to scientific evidence; any norm of conduct repugnant to the moral ideal, any concepts, dogmas or beliefs repugnant to philosophic Reason; any symbolical representation or ceremonial repugnant to the artistic sense. What is even more important for our purpose is the recognition that neither Science nor Philosophy nor Art can take the place of Religion. All the mid-Victorian dreams of a scientific religion mis-called natural religion, or a philosophical religion, the so-called religion of pure reason, or an aesthetic religion, the worship of the beautiful or of Art as Art, are at once seen to be irrelevant, wholly beside the mark. There is no doubt a religion of Science, in other words, a religious interpretation of

phenomenal experience generalised and unified. But the religion of Science is Religion, not Science. There is also a religion of Art, the appreciation of the art-ideal and of the various aesthetic *Rasas* as moments in the one ultimate *Rasa* (रसब्रह्म). But this is Religion, not Art. Similarly, the religion of philosophy, the vision, the realisation, of the Absolute as the self, is religion, not Philosophy. It is true there are certain mixed types, a philosophical religion, as the religion of the Upanishads or a religious philosophy as of Shankaracharya and Spinoza; an aesthetic religion, as in certain forms of Radha-Krishna worship, or a religious Art as that of Dante in the Divine Comedy, or of Rabindranath Tagore in the Gitanjali. There is also a scientific and positive religion, as the positive religion of Comte; and there are indications that we may have shortly a religious science on the basis of a synthesis between physics and physiology, or, what is the same, between living and non-living matter. In the same way there may be a religion of work, of social service, of the social and household code of duties; but it is not duty as duty, or work as work, which is religion in this case, but work transformed into life and experience, work transmuted into the inner spiritual grace and freedom, work in the spirit of the *Mukta* (the Emancipated) or the *Bhakta* (the Saint). Each Science, each Art, each code, then, has an autonomy, is subject to its own laws or ends which religion must not seek to over-ride or dominate in their own particular sphere of thought or practice. But in the final organisation of life and experience these subordinate laws and ends must obey the regulative ideal of religion, in other words, the ideal of the complete or perfected life.

THE *Yugadharma*—CATEGORIES OF THE RELIGIOUS LIFE.

Let us now see how this new sense of religion, freshly recovered in our days after the eclipse it suffered in the utilitarian conventionalism of the mid-Victorian Era, approaches the eternal verities of the religious life, or what use it has for the great symbols which the mind and imagination of the race has constructed to give body and shape and universal currency to the innermost truths of religious experience. God as Father and Mother, God as Lover and Friend, God as King and Judge, those

symbols of the relation between ourselves and our source; God as Revealer, Inspirer, Redeemer, those modes of the Divine manifestation in the life of the individual or the race,—or conversely, Man as worshipping, communing, sacrificing, praying, giving thanks and praise, singing psalms and hymns, those modes of the finite surrendering itself to the Infinite, whether individually in the closet, or congregationally in the House of God,—these and other constructions of the religious life are indeed of even deeper and fuller import from the standpoint of our universal Theism than they have been to the Churches and congregations of old. And this is because our life, our being and activity, have been deepened and widened with the process of the suns. For, the more we are enriched with the life-blood of humanity, the more we receive the influx of the spirit, the incoming flow of the life Divine, as fitter vessels of Grace and Communion.

GOD AS FATHER, MOTHER, FRIEND AND LOVER.

In the Father we realize the Divine Transcendence, the infinitude of the expanse above and beyond us; in the Mother we realize the Divine immanence, the all-embracing plenitude of the expanse within us. In the Father we apprehend the Divine Idea or form, which gives the law to our activity, and prescribes our orbit and our goal; in the Mother we apprehend the Divine Matter, which upholds and sustains our being, and envelopes us in the end in the bosom of Rest and Peace. In the Father, we have a far-seeing love, the overseeing eye upon us; in the Mother, the ever-near love, the soft caressing hand that stills our throbbing. In the Divine Friend, we realize that the big universe around us is not an iron machine ready to crush us ruthlessly, or a blind Octopus ready to embrace us in its tentacles, but that the world-order bears good-will and trust, that, in truth, despite all contrary seeming, there is no strife between Nature's purpose and ours, but harmony and peace; and that the nature of things, the scheme of the world, calls for our loyal acceptance and trustful co-operation. In God our Lover we realize the Divine more intimately still in the privacy of solitary communion, an all-engulfing ecstasy. We realize that, soiled and sinful as we are, we are necessary to the life of the Universal Being,

more necessary than all the gods and saints in their beatitude; that I, even as I am, am unique and of infinite and transcendent worth to this Being, my Lover and Seeker, whose Perfection is nought unless it wins my imperfection's hand and pledge.

GOD AS REVEALER, INSPIRER AND REDEEMER.

He comes to us, the Revealer, the Inspirer, the Redeemer. Not to us to-day clad in the thunders and lightning of Sinai, but in the dust and the weed as in the star and the flower, in the wail and the street gamin as in the prophet and the saint, *Rishi* or *Nabi*. For Creation is our Scripture. Not in nature merely nor in the Soul merely, but in history also we find Him. The history of all creation is to us the self-revelation of the Deity in ever and ever fuller measure, in ascending grades of being. No central or final revelation, but a continual unfolding in new and varied forms of life and experience, that is for us to-day the Revelation of God to Man. He reveals and He inspires. This inspiration, this in-breathing of life, this inworking of the creative principle, is attested in the individual by an unfailing sign,—the individual stamp of an original creativeness in any form of living activity. He inspires, He redeems. But the redemption of the individual soul is for us to-day no passive but an active experience. The sense of conversion, election, grace, the experience of the twice-born, the new birth in the soul, as the inner subjective phase of redemption, will no doubt always remain as an accompanying mark; but of one thing the modern religious man stands assured, we are individually redeemed only so far as we share in God's redemptive activity—so far as we are redeemers ourselves by our life-giving service, our sacrifice in loving humility.

MAN'S ASCENT TO GOD—OUTSTANDING PROBLEMS.

But with us to-day the descent of the Infinite is no longer the miracle it used to be in ages past; it is the upward ascent of Man to God, of the Finite to the Infinite, that is the outstanding problem of the religious life, its tragedy and its paradox.

THE PROBLEM OF PRAYER.

Our prayers are apt to be construed as only subjective devotional exercises, good for the health of the soul from the medicinal

point of view, useful as auto-suggestions or as exercises in self-hypnotism; but useless for everything else, for any practical needs of creatures of flesh and blood. For the creature needs a Father in Heaven, not a moral ineptitude; not an empty form of goodwill, not a scientific law, who cannot lift his paralysed arm to prevent even the fall of a sparrow, or by dint of goodwill save an erring weak will from ruin,—but a Father whose responses to the appeal of the sufferer in the hour of agony,—are more remedial and selective, in one word, more personal not less, than those of an earthly parent. The pompous distinctions between physical and spiritual benefit, between miraculous and natural intervention, between the realm of law and the realm of Grace, are irrelevant to the suffering soul in the hour of agony. A pale bloodless dehumanised creed may suit a scientific automaton but not the man of flesh and blood.

THE PROBLEM OF FREEDOM.

Again, the problem of human freedom versus Divine Will is more than ever insistent in an atmosphere surcharged with pragmatic and humanistic currents, and can no longer be shelved as a metaphysical riddle of no practical interest or significance. We see with bewilderment, if not with dismay, that this human freedom which we have learnt to prize as the breath of life, cannot be saved unless we provide somehow for the really contingent in the universe, which by being contingent to man's reason, must also be contingent to God. These then are for us the three outstanding problems of the religious consciousness;—the problem of *freedom* in an age more than ever convinced of the value of freedom in every field of life and effort,—the problem of *evil* in an age more than ever conversant with the reality and the terribleness of pain and wasteful destruction in the scheme of biological evolution, and more than ever abhorrent and intolerant of pain and privation in all their forms,—and, lastly, the problem of *prayer*, the reality of free selective personal response from a personal God, in an age more than ever convinced of the worth of personality and the need of personal relationship in the unfolding life of the Spirit. And it is as well to recognize frankly that unless we boldly faced these problems, man's practical attitude towards God, which is the essence of

religion, could not be placed on a sincere and rational basis; we should be left to a religion which is only half-sincere, a religion of compromise, a religion of make-believe, which is indeed worse than no religion at all.

GOD IN THE WORLD. RECENT SUGGESTIONS.

In this sea of doubts and bewilderments, some religious souls find rest and peace in the idea of a world-spirit, who in His infinite wisdom and mercy imposes fetters on his own omnipotence that his beloved children may have scope for their free self-realisation, who in the history of creation manifests Himself as a suffering God. In the battle of the standard that is raging round us, He calls us as new recruits to a never-ending ever-beginning fight.

God, who is our Friend and Guide, our Master and Guru, turns a willing ear to the call of our entreaty, and is thus capable of sustaining our prayers and our thanksgiving, our love and our goodwill, our sympathy and our trust.

GOD AND SOCIAL SERVICE.

The upholders of this creed maintain that such a World-God not only beckons us to higher heights and deeper depths but draws us closer to the homes and haunts of humanity, in field and country, in street and bazaar and workshop—yea in the slums and cesspools of our cities. Each of us, strong and weak, saint and sinner, wronged and wrongdoer, the man of faith as well as the man of unfaith, is a tabernacle of the World-spirit, unlit or dimly lit as the case may be, waiting for the lighting of the Lamp of lamps, waiting in the dark for the manifestation of His Real Presence. The service of man becomes the service of God—yea of the God in man. In view of these recent theological developments it is important to note that our Hindu forefathers, as well as the Christians in their prayers to God, have enjoyed much of that intimacy of personal communion which this concept of God may secure for the theistic worshipper of our day. To the monotheist the World-God is but the manifestation of Parabrahma in the world.

THE INNER DISCIPLINE.

But every *Yugadharma*, every Revelation vouchsafed to a new age, enables us not only to see God anew, but also to find Him in a new path of discipline as the goal of a new *Sadhana*. What then is the method

of spiritual culture in the Universal Theism of to-day?

Our quest is the consummate experience, 'The Perfect Life on Earth as the guarantee of the transcendent life, the Perfection beyond.'

The starting point in this quest is our limited fragmentary experience facing three ways. The three gateways of Reality are willing, knowing and feeling, and the three ways are the Way of Work, the Way of Knowledge and the Way of Love.

In the way of work the individual begins with the pursuit of personal ends, and passes on to the middle station of duty for duty's sake, when all friction, struggle, effort ceases in "the rigour of dispassion," and this in its turn "gives way to love and spontaneity, to the sense of blessedness in the work." Egoism is now overcome, and the agent becomes conscious that he is merely the instrument of the Supreme Will.

In the way of knowledge the individual begins with reflection on the self. He discriminates and detaches the Self from the not-self;—the eternal from the transitory, the noumenal from the phenomenal. He passes on to the middle station on this road, "The knowledge of the self of self as the *Antaryami*, the witness, the Alpha and the Omega beyond the bounds of Space and Time." In the end, he sees the world as comprehended in himself, and the world and himself as comprehended in the Universal Self.

In the way of love the devotee begins with prayer and thanksgiving and praise. Worship expresses itself in acts of homage and completes itself in self-surrender. The Lord, the Master, the Guru becomes all in all. From adoration he passes on to the Love which cancels all difference. The Infinite puts off its veil of infinitude, the finite puts off its veil of illusion. The gulf is no more. As friend, as lover, as the world-child, He sports with His own. All experience of life, in fine, in the world, is the pursuit of this love.

PROBLEMS OF PRACTICAL ORGANISATION IN THE THEISTIC CHURCHES.

But in whatever form the *Yugadharma* may win our individual allegiance, there is no doubt that for us Indian Theists the reconstruction of a pan-Indian, pan-historic, universalistic type, of Theism is a prime spiritual need. And not only in the spiritual construction of the religious life but

also in the practical organisation of our Samajas and Congregations, we are entering on an era of expansion and broadening outlook. This will appear clearly from an examination of some of the practical problems that face the Theistic Churches in India.

MEMBERSHIP AND CREED.

I will first take up the question of membership of our Theistic churches, namely, the question of the formulation of creed and dogma as a condition of such membership.

The father and founder of the Brahma Samaj, Raja Rammohun Roy, laid down a very catholic and comprehensive platform. In the *Anusthana Patra* and other writings he favours the inclusion of all who practise contemplation of the origin of the universe and a code of ethical duties emanating from that source, and he fraternises with the *Nanak-Panthis*, *Dadu-Panthis*, the *Santas*, and such of the *Ramayats* as did not worship by means of shrines and images, not to mention the unitarian Christians and the followers of Islam. As to the ultimate source and origin of the universe, he did not lay down for the Samaja any hard and fast concepts or beliefs. He allowed full liberty to all manner of philosophical conceptions of the Godhead, of the absolute and infinite, with a comprehensiveness quite worthy of the *Kusumanjali* itself. Subsequently in the Brahma Samaja this wide interpretation of the Theistic position was narrowed down to a formulated creed of which there have been different enunciations, but this has not served to exclude from the membership of any Brahma Samaja individuals of widely divergent types of theistic (or even agnostic) belief. To-day the various Theistic bodies in the country, and even members of the same body, differ very widely from one another regarding their personal confession of faith, and no formulæ can be devised which are not elastic enough to admit into their folds the most heterogenous and non-descript assortment of speculative beliefs and postulates. This has been the history of non-conformity in the West, and the Free Christians have at last abandoned all definitions of creed, all subscriptions and confessions of faith. Practically whoever elects to become a member gets in, and

whoever wants to stay in does so, in all such free bodies, whether in the West or in the East. Even if any section of the Brahma Samaj or other Theistic body were to start today with a hard and fast creed, the widest divergence in speculative matters would follow in the course of one or two generations, as no uniformity of philosophical or theological belief can be expected in the free and open atmosphere of modern thought and culture, and any zealous attempt to preserve purity and uniformity of faith would lead to ever-multiplying schisms and secessions. Even the established churches with their subscriptions and articles of faith supported by ecclesiastical preforments and ecclesiastical courts are uniform only in name, and conceal a miscellany of faiths under the appearance of unity.

A COMMON CEREMONIAL AND A COMMON PERSONAL LAW.

Hinduism avoids this difficulty by having no theological creeds or dogmas, and by laying down only social observances and socio-legal customs as tests of conformity; and as a matter of fact this is the sort of test to which we must all ultimately come. Only in the Hindu community these practices are ceremonial or sacramental in their nature, but more and more the ceremonial bonds will disappear, and the connective tissue would come to be a common customary, a common personal law, which, in the end, will be replaced by a common territorial law. A common creed, a common ceremonial, a common personal law, and in the end a common territorial law,—these are the ascending stages in the march to a personal life within the life of the community.

The Theists of India welded together by faith in the Fatherhood of God and Brotherhood of man, are more or less free from the fetters of a fixed creed and obligatory ceremonial, and any attempt to rivet the chain of creed or ceremony, whether in a theological interest, or as a preliminary to the evolution of a common personal law for the Brahma community, would have to be considered with grave circumspection lest it should impede the free and progressive growth of Theism itself and prove to be reactionary and in the end as full as reactionary.

THE MARRIAGE ACT OF 1870 & SUCCESSION.

Again, the Theistic communities have no personal law of their own, for the Marriage Act (Act III of 1870) only legalises the marriage but does not necessarily change the personal law of the parties to the contract except in the matter of marriage itself. The fact that the Theists have no separate personal law would scarcely be a disadvantage in the present fluid and fluent state of these bodies, if only the parties to a marriage under the Act were allowed to choose their own personal law of succession and inheritance, i. e., either to retain the personal law in which they were born and bred, or to adopt the law under the Indian Succession Act, according to a declaration to be made at the time of the marriage or at some subsequent date. But in any case in the end personal law is bound to disappear in the territorial law, and if we want to have the disabilities of the various systems of personal law removed and at the same time are not satisfied with the Indian Succession Act, we may demand an improvement in its provisions.

But if this appears hopeless we may at any rate demand a personal law of our own without fettering ourselves with a ceremonial code, even if it were to be no more than a model or exemplar.

BOND OF UNION AMONG INDIAN THEISTS.

What is it, then, that serves as the bond of union among the Indian Theists? No doubt, in some of our churches there have been internal bonds in the shape of creeds, liturgies and Sambitas (ceremonial codes), though as we have seen even these creeds are coming to be more and more elastic, if not nominal or obsolete. But in the absence of a common subscription or confession or a common ceremonial or personal law, is there a Theistic community or communal life? The answer is clear. The *de facto* bond is membership of some Theistic congregation based on similarity of convictions, aspirations and ideals, partly religious and partly social; and as new Samajas are formed, or the existing ones multiply or subdivide, the common hopes and ideals will become more and more indefinable in terms of positive formulation, until, in the end, with the widening of religious ideals, there will be only one congregation left, that of

the worshippers of the True, the Good, and the Beautiful God, held together in the Church Universal, the Church of all time. That is the only congregation that lasts, that runs like a golden thread through the web of time. All other churches are aisles of this one church, choirs within this one congregation.

THEISTS AS REFORMERS, RELIGIOUS AND SOCIAL.

But in the meanwhile we have also some negative bonds and marks. We are bodies of practical reformers, and like all such bodies, whether in the social or in the religious field, we are held together by our practical programme of reform, at any rate until our reforms are accomplished. We, who are mainly of Hindu extraction, have rejected certain practices of the orthodox community;—we have had no need to reject any tenets or dogmas, as Hindu orthodoxy insists on none. We have rejected idolatry, idolatrous ceremonies and Sanskaras (sacraments), caste, non-adult marriage, the Zenana system, and the compulsory celibacy of widows. These negative marks, by dividing us from the orthodox Hindu folds, have drawn us together. But as reform associations our Theistic bodies have a peculiar character. Some reforms, as in matters of food, drink, dress, can be practised by individuals independently of social acceptance. Some require co-operation of other individuals, or of the general body of the people, or of the State itself. Reforms may also be divided according as they do or do not lead to excommunication from general social intercourse, according as they are or are not usually inherited from father to son, or according as they do or do not require or obtain any State recognition. Social and religious reforms generally require co-operation, are often under a social ban, and are likely to be inherited.

The Theists in rejecting idolatry, caste, and non-adult marriage, became pronounced reformers of this type, and naturally formed a community with a social cohesion based on marriage and commensality among themselves. They also required and obtained legislative sanction. In the absence of a general civil marriage Act, a special marriage facility was granted by the State in their case, viz., the removal of the disability under which they laboured in contracting mar-

riages in accordance with their own programme of reform. But Indian Society is rapidly passing to the stage in which a legal provision for a Civil Marriage Act without reference to religious persuasion or creed is one of the decencies, if not the necessities, of civilized life ; and when this is secured, the cumbrous Act III of 1870, with its curious negative declaration will become a dead letter. Not a special Brahmo Marriage Act, but a general Civil Marriage Act without any declaration, positive or negative, as to the religious persuasion of the parties concerned, should be the objective of our efforts. A special Brahmo Marriage Act is likely to present grave difficulties, whether we define a Brahmo by creed or ceremonial ; or maintain registers for the purpose of the Act, or leave the matter to the declaration of the parties themselves. A general Civil Marriage Act, on the other hand, will give a general relief in the simplest and most effective way. Indeed large numbers of our orthodox brothers will also profit by such an Act to provide a safeguard against polygamy and other risks to which the orthodox marriage bond is now liable, as well as to celebrate intercaste and adult marriages and the remarriage of widows. Further, a Brahmo Marriage Act will be a barrier against the rapprochement of the orthodox community and the Theistic reformers, while a Civil Marriage Act will hasten their union.

SOCIAL REFORM : MARRIAGE AND THE FAMILY.

In fact, the Theistic reformers are being more or less overtaken by the most cultured and advanced sections of the orthodox society, at any rate in Bengal. Non-idolatrous monotheistic worship, or the non-performance of an idolatrous Shraddha or other Sanskara, is no longer under an effective ban. The Zenana system has mitigated its extreme rigour, thanks to the exigencies of railway travel and health resorts, if not also to female education in part. Child marriage is doomed. Widow re-marriage is being celebrated under orthodox Hindu auspices, though an infinitesimal fraction has reaped any relief therefrom. But what remains to be done is a matter of social education. Lastly, caste in the educated classes now turns on the pivot of marriage, only, at least in Bengal, where restrictions on food and commensality are now matters of the past.

Among the masses, caste no doubt performs some useful functions still, viz., those of industrial guilds including apprenticeship, as well as of the preservation of social morals. But among the educated classes all the useful functions of caste organisation are non-existent, and the arrestive and disuniting effect alone remains, as well as the now useless and very often positively hurtful function of endogamy. But there is reason to believe that, with the growth of individualism, the spread of culture and of female education, and the weakening of the joint family and other ties of dependence on the family group, intercaste marriages will take deeper root in the great Hindu society, once the trammels of an artificial English-made Hindu law are removed ; and such marriages will again be recognised as legal, as they were for long generations recognised in the ranks of the Bengal Vaishnavas under the rulings of the Hari-Bhakti-Vilas, and of the Shaivaite community under the rulings of the Shivanushasana,—and as they still are in the *anuloma* form in the independent Kingdom of Nepal,—before the English ignorance of Hindu usages stereotyped the canonical Smritis and arrested the natural development of Hindu personal law.

SCIENTIFIC PRINCIPLE OF SOCIAL REFORM.

If, therefore, we theists are to remain in the van-guard of social reform, we must now form a programme of advanced social and socio-economic work on sound scientific lines. We have hitherto taken our social reform measures piecemeal. We have been actuated by motives of social justice and compassion in the fight against social evil and tyranny. Such motives must always remain the mainspring of social reform, but in a new and complex situation, where the reform amounts to re-constitution of the basis of social life, we must be guided by an intelligent insight into the biological and economic principles which govern the evolution of that life.

Take, for example, the institution of the family.

The Hindu family has a certain patristic structure and is based on a certain conception of the marital relation and of parenthood. In the orthodox society, the age of marriage, the selection of bride and bridegroom, the dowry arrangements, the social as well as the legal status of the widows,

the rights of women regarding maintenance and succession, have all been regulated with reference to that family structure. A radical change in any one of the arrangements must affect the others, and the reformer must therefore keep the whole *ensemble* in view. For example, many of us Theists have departed from the spirit of the joint family, even where we have kept up the form. Again, we desire to give our womankind full liberty of choice in the selection of partners in life, that great psycho-social stimulus to the development of a genuine personal life. But we fail to appreciate all that is involved in such a change, and accordingly our minds are confused, our efforts straggling and ill-concerted, and our achievement slow, uncertain and dissipated in friction and discord. To come to concrete illustrations, we have done away with the dowry but we have introduced no marriage settlements, such as are customary among Christians and Mohamedans. Our married daughters have usually no *Stridhana*, no part and parcel, direct or indirect, in the parental property. This is in the first place a one-sided conception of the responsibilities of parenthood, involving an injustice to the daughters in favour of the sons, and this militates fundamentally against our desire to give a genuine personal life to our womenfolk: for personality and personality, ownership of soul and ownership of property, go hand in hand in progressive social evolution. What is more, so far as the joint family is breaking down, and our married couples are beginning to start new homes, the want of such settlements operates as a check against marriage, and helps the increasing unwillingness on the part of young men and women to take up the burdens of family life, or at least of an increasing family.

Again, the new social arrangements in our Theistic Communities necessary for making marriages by free choice possible in fact, instead of merely in name, are in a very rudimentary stage and what we have so far achieved in this direction is to put new wine in old, very old bottles. But these are only preliminaries.

FUNDAMENTAL QUESTIONS.

More fundamental questions will soon be pressing for solution. Adult marriages

contracted by mutual choice, with whatever degree of parental control, must bring with them new problems of the marital relation, bearing on the legal status of husband and wife, problems which cannot be indefinitely shelved.

As for the legal status of the widow in intestate succession, it is uncertain under Act III of 1870, whether and under what conditions the Indian Succession Act or the Hindu Law would apply.

POINTS OF INQUIRY FOR A BRAHMO CENSUS.

It is incumbent upon our theistic churches to take a census giving us the facts as to the maintenance or otherwise of the normal equilibrium in the proportion of marriageable young people of both sexes of certain specified periods of age. We ought also to have the facts regarding the normal dimensions of our families and the fecundity of adult marriages in our communities with the proportions of male and female birth. The rate of marriage and number of bachelors and spinsters above the usual marriageable age are also proper matters for inquiry. And in the light of these statistics we must proceed to inquire into the economic factors that influence marriage and whether in these incipient communities such factors are operating healthily or unhealthily.

UNIVERSITY EXTENSION FOR OUR WOMEN.

Another important and closely connected question is the high education of our girls, how far and in what direction the University and high school courses may require to be modified to suit the needs of women and how the physiological drain of public examinations on the adolescent female constitution may be avoided or minimised in the interests of the race. A programme of University Extension for women with systematic courses of lectures in various subjects in the vernacular followed by examinations and diplomas is one of the practical needs of the hour. The claims of Art and Music to a fuller recognition in the University and high school courses must come up in this connection, as also the provision of adequate facilities for the training of women for vocations like Teaching and Medicine for which women's work is in imperative demand and more so in this country than in any other.

The next point to which I would draw attention is the growth among our community of the habit of residing in towns, in many cases in crowded tenements. This may have been the outcome of many existing circumstances—but it must be admitted that this state of things is far from being desirable, considered either from the social, sanitary, or economical point of view. Our friends must cultivate and realise a strong attraction for and be associated with land and rural life before we can expect a healthy and sturdy development in ourselves.

Social culture must begin with the growth of codes of etiquette; and in a free community like ours the absence of such a code is a regrettable fact. Let us trust that amongst our countrymen generally and our members particularly, a proper code of etiquette based upon culture and sincerity will soon grow to help our social intercourse.

THE DEPRESSED CLASSES—MISSION TO THE PEOPLE.

In Bengal, the question of caste, for the educated classes, reduces itself to that of intermarriages. I have already dealt with this aspect of the question. But whether in Bengal, in Bombay, in Southern India, or elsewhere, the most vital and urgent social problem of the day is the uplifting of the depressed classes, the "untouchables," who form the masses of the people in India. The old Hindu agencies, whether Vaishnavic or Shaivaitic, which brought so many aboriginal tribes, many of them with head-hunting tendencies, into the Hindu fold, by silently adding a Brahmanical Sacramental leaven to the aboriginal cult and which also often gave them a status in the hierarchy of caste by inventing a Kshatriya, a Vratya-Kshatriya or a Brahma-Kshatriya pedigree for the more powerful chiefs, have almost ceased their missionary activities. Islam, more successful than Christianity in the jungles and fastnesses of Central and Northern Africa, has not made much headway among the Indian aboriginal tribes. But Christianity has recently had a great missionary revival, comparable to what we are told of its power with the masses under Xavier himself, and the great mass movement of our day in Southern India towards Christianity must bring home to us, Indian theists,

the responsibility that sits on us to save for them the indigenous Indian culture and tradition by opening up to them the portals of hope and comfort, both here and hereafter. For no form of religion has any life-value to-day which fails to yield a living inspiration and social service, more specially the service of the lowly and the overburdened, the afflicted and the downcast, the oppressed and the fallen; and devotional religion in our Samajes, if it be not a mere luxurious sensation, must go out among the depressed classes in loving humility and patient live-giving service.

A PRACTICAL RELIGION FOR THE MASSES.

In organising the religious life of the masses we may receive guidance from an intelligent study of the methods by which the great historic religions have been brought home to the people in all ages and climes. The outstanding features of such attempts, in the past have been: (1) The laying down of certain simple practical rules of conduct for implicit religious observance, with the authority of a canonical code or sacred table such as the *Panchasilas* (the five religious duties) of the ancient Hindus, the Buddhists, and the Jainas, the Commandments of the Mosaic law and similar Islamic and Confucian tables, enjoining honesty, chastity, temperance, truthfulness, neighbourly charity, kindness to men and animals and the worship of God or prayers at stated hours or seasons; and (2) The institution of certain festivals and popular gatherings, with singing, reciting, play-acting, dancing, eating and drinking, &c., to enlist the instinct for social play for the service of social religion. We Indian theists must adopt these methods to modern social wants in the Indian village environment. A popular religion for the Indian masses of to-day must be based on *Bhakti* or devotion to God (Hari, Shiva, Vishvakarma, Allah, the use of the name depending on the folk concerned) without definition of creed or dogma, and with a simple code of religious duties, expressing the Divine will and bearing on conduct.

Among the religious duties the chief will be temperance (or total abstinence principles), chastity, truthfulness, neighbourly charity, kindness, cleanliness, sacredness of infant life, respect for women as mothers of the race, avoidance of extravagance on festive occasions, and, above all, the sacredness of one's handiwork, so that faithful

work may be synonymous with the faithful service of God (Vishwakarma or Allah). The popular countryside festivals and religious gatherings must be kept up, to keep alive the spirit of cheerfulness and play in the people. But the festivals should be simplified, purified, and beautified, adapted to the changes of the seasons in Nature. The *Sanskaras*, the sacraments of birth and death, of initiation and marriage, should be simple, touching and sublime, with the simplicity, the pathos, the sublimity of man's life. Methods of popular education with all modern appliances, eked out wherever possible by indigenous institutions, like *Kirtan*, *Kathakata* and *Yatra*, should be pressed into the service of popular religion.

If this is the Yuga-dharma and these the practical problems of organisation for the Indian Theists of the present generation, the question must be raised how all this is related to the history of the movement of Universal Theism in the country since the advent of its father and founder the Raja Rammohun Roy. That movement has run through three phases, and is now entering on a fourth.

The first phase—that embodied in the Raja himself, gives us the foundations and the ground-plan of Universal religion. Dominated by the concept of Brahma as the Absolute Reality, the Raja viewed the panorama of the world in Nature as well as in History, as the manifestation of Brahma, a manifestation in higher and higher grades of being, in the inorganic world, in the varied forms of life, in moral force such as *Brahmacharyya* and *Tapasya* in the Scriptures—above all in the *Atman*, the Self. The way to find Him is not by withdrawing the Self from the world and remaining serenely poised in the cessation of all activities and all relations, but by realising our being in His being, our consciousness in His consciousness, our bliss in His blessedness. To grow into the cosmic consciousness, that is *Mukti*, liberation from bondage,—to be attained by the constant practice of *Upasana*, meditation on the Brahma, and the pursuit of *Lokashreya*, the well-being of all creation. In the Raja's philosophy of life, each science, each art, each social institution has natural ends of its own, which are legitimate objects of pursuit, in their own sphere and which religion must not seek to override or frustrate: but they all find in religion their ultimate bond

of unity, their ideal fulfilment in an ultimate harmony and reconciliation. And the Raja was himself the grand living synthesis which was the quest of his philosophy. In his own person the Raja was a complex of half a dozen personalities: an Upanishadic Hindu, an agnostic Buddhist, a rationalistic Mahomedan, a Unitarian Christian, a utilitarian Confucite—not by turns—changing with the phases of the moon as so many eccentrics before him and after,—but all fused together, harmonised in the Humanitarian Cosmopolite—a realised Universal Man, prophet and precursor of the Coming Race in his Universal Religion.

The second phase, that of the religious life dominated by the concept of *Paramatman*, the Self of Self, was centred in the Raja's spiritual heir and successor, Maharshi Devendranath Tagore, the life of the modern as opposed to the medieval saint. No religion has any life-value which cannot present before us its own *Jivanmukta*—its great exemplar, its Man-in-God: and the Maharshi rendered a unique service to the cause of universal religion by showing to the world the type of the modern mystic and seer. But the Maharshi gives us not only the personal life which is the supreme test of a religion, the life of communion with the Divine which transfigures work and service into freedom and the blessedness of the spirit, he gave something more to his countrymen. He gave the theological moulds, the religious concepts and constructions in which to cast the widening religious experiences of the new age; he tested the ultimate philosophy of life of the West by that of the East; and he tested both the Eastern and Western religious traditions by his own living experience, his own inner life-history. He opened up for the nascent or renascent India of his times a middle path, a *via media*, between the two paths of life, the Eastern and the Western which crossed each other, and he incorporated much of the Western belief regarding man's life and destiny into the religious dogmas which he constructed—though for one who was spiritually as well as lineally a descendant of the Holy Rishis of India, the Perfect Life was framed with Upanishadic setting. The Maharshi will remain the spiritual Guru of universal theism for a long time to come.

Next followed the third phase of the Theistic history, a phase dominated by the concept of God as *Bhagavan*, the

Lord of Dispensations. This phase we find embodied in Brahmananda Keshub Chandra Sen, the Man of the New Dispensation. He was the type of the supreme creative artist in the sphere of religious life, a genius equally prolific in creating creeds and dogmas, types and symbols, rites and sanhitas (codes). He would coin into flesh and blood, as it were, the religious ideas that have been held in solution in all religious and ecclesiastical history. To mention a few of these—the great-man doctrine in religion, the doctrine of the Logos and the son of God, the Christo-centric community of Prophets, the pilgrimage to the saints, the communion of all souls, the church invisible, the church as the organ of the corporate religious life, the apostolic durbar, the doctrine of special inspiration (Adesh), the sacraments of the new baptism and the new homa, a New Samhita a, sacramental code, a new flag and emblem, an All-India Theistic mission, the revival of Sankirtan, God-vision and madness in religion, the synthesis of Yoga and Bhakti as disciplines, the scripture of life (Jivan Veda), the social reform propaganda, and the Marriage Act. These were among his amazingly prolific constructions: but the most luminous of all was his vision of harmony of all religions and all dispensations, which will remain one of the beacon lights of future religious history.

The fourth phase of this religious renaissance in modern India opens on the present generation. We are confronted with the great task of organisation, the task of consolidation and of expansion alike. We theists feel to-day the imperative need of drawing closer

to our kith and kin, our flesh and blood, in the bosom of the mother—the mother society in which we were born and bred, whose blood runs in our veins, whose bounty feeds us as a mighty river feeds its many branches. Our greeting of love goes forth to our brethren, in the name of Bharatavarsha, the land of the Himalayas, the Vindhya, and the Nilgiris, girdled by the Indian ocean, and watered by the seven streams. But we call them not to the battle for rights, the din of controversy, the dusty and clamorous contests for the prizes of this world. We call them to the altar of sacrifice, to lay down each his pride of birth, of riches, of talents; to lay aside every cherished privilege and power, every exclusive boon and bounty, on the altar of sacrifice, for a common participation in the common life of the Mother. The call of renunciation has ever been the call of Mother India—renunciation for the sake of Brahmavapti, the absolute fulfilment and fruition; and it is only by patient humble toil in this spirit of self-renunciation among the poor and blind and hungry masses of our brethren, in field and bazar and workshop, that we can be true to our Mother, the common mother of us all. Such has been Mother India's age-long sadhana of fulfilment in renunciation, of *Anandam* (bliss) risen out of the depths of tribulation; and in Her name we shall go forth to the world preaching deliverance from the spirit of unrest and strife, preaching *Maitri* to all, preaching Peace, the Peace of Brahma to a world distraught, and Emancipation to a world in chains.

Presidential address delivered at the All-India Theistic Conference held in Bombay, December 25, 1915.

REVIEWS AND NOTICES OF BOOKS

ENGLISH.

The Autobiography of Maharshi Devendranath Tagore.
Translated from the original Bengali by Satyendra Nath Tagore and Indira Devi. Macmillan & Co., 1917. 17s. 6d. and 29s. Price 7-6 net.

The inner history of a noble soul is bound to be of absorbing interest to those who have a soul-history of their own, for it is not every man who can boast

of such a thing always, not every man who can boast of a soul *dynamic*, and not *static*. Such a history we have in the Autobiography of Devendranath, a remarkable production, but which is sure to prove "weary, stale, flat and unprofitable" to those who have not tasted of the joys and sorrows of the inner life. But those who have entered into the spirit of these writings cannot but be surprised at the richness and wealth of the book, and it is but a poor eulogy

to say that it has enriched Bengali literature to an extent which the general reader is hardly aware of.

This translation, therefore, which we have before us, though it is only a pious tribute to the memory of a saintly parent, is really a contribution towards world-literature. It has placed before a wide circle of readers the inner workings of one of those souls which were in tune with the Infinite, and which therefore could not but give out the divinest of music.

The Autobiography has an Introduction by Evelyn Underhill, an Introductory Chapter by the translator, two Appendices containing some select Sermons and Prayers by the Maharshi, and several other extracts. The translation has, as in the original Bengali, thirty-nine chapters in all.

The plan of the book is admirably suited to make the life of this great man intelligible to those who are not in touch with the modern currents of Indian thought. The introductory chapter by the Translator serves, so to say, the purpose of a context to the life of the Maharshi by placing it in a true perspective with relation to the movement known as the Brahmo Somaj, while the Introduction by Evelyn Underhill is really a translation of the spiritual life of Devendranath "into that language of spiritual experience which is most familiar to Western students." Without some such interpretation the Eastern mystic would have remained a puzzle, a curiosity, or rather a curio, to the Western mind. But, as it is, it will enable the appreciative reader to enter into the meaning of the various stages of development of the Maharshi's life. The writer has traced its growth step by step with remarkable insight into the movements of an Oriental's mind, and has touched upon all the important points which mark the "salutary ascents." In this fine analysis have been recorded with an unflinching hand the ups and downs of a growing soul,—and there are ups and downs in the life of even the most exalted ratures,—and the writer has noted faithfully the constant swing of the spiritual pendulum from light to darkness, and from darkness to light, which checker the ground-plan of every elevated mind. But that which is most helpful to the Western student is the constant and illuminating parallelism drawn between the Maharshi and the Western Saints at every critical turn of the former's onward move, and these parallel experiences taken from the lives of the Mystics of the West, with which the occidental mind is familiar, are calculated to help much the proper understanding of the history of this noble devotee. We strongly recommend this Introduction to those also who have had the privilege of reading the original in Bengali, because we have no doubt that it will throw a new light on their study of the man.

We have incidentally noticed above the Introductory Chapter by Mr. Satyendranath Tagore, and have pointed out its real utility. Here we have a brief sketch of the Maharshi's life and also of the Brahmo Somaj. The account given of the latter is singularly lucid, illuminating and impartial, and Mr. Tagore has assigned his father his legitimate place in the history of this revivalist movement. Naturally the latter half of this history resolves itself into the life of Keshub Chunder Sen, on whom the mantle worthily fell. The account of the part played by the Brahmananda has been on the whole very appreciative, but we must say that in one or two points the writer has done us injustice to Keshub. Says he, "He [Keshub] surrounded himself with a band of devoted followers,

some of whom worshipped him as an Avatar with a blind unreasoning faith." We know that this charge was brought against Keshub at that time, and also we know that it has often been repeated by a certain class of writers, but we hardly expected to see a repetition of this accusation come once more from the pen of Mr. Tagore, who has given us an otherwise faultless *resumé* of this important movement. We should be glad to know the authorities on the strength of which he makes such a damaging statement.

Now we turn to the main book itself—the Autobiography proper, and here one cannot but be struck by the simple, straightforward and unostentatious outpourings of the soul,—a narrative which at once convinces and satisfies. In it we are brought face to face with the doubts and solutions, hopes and despairs, longings and fulfilments, and raptures and disappointments of a soul thirsting after God, and it is good for us to be here.

This Autobiography, however, has a twofold significance,—not merely is it the soul-history of Devendranath, but a key to the religion of the Brahmo Somaj, too. Considered as the first, we find here how the thoughtful and despondent young-man grew into an enthusiastic devotee. We see distinctly the steps he took on his passage from darkness to light, and how the Divine revealed Himself into the human. The characteristics which stand prominently out are an uncompromising monotheism, a fearlessly critical attitude of the mind, an unreserved surrender to the will of God, a devotional spirit which maddened him, a union with the supreme soul which threw him into raptures, and a deep love of nature which made him travel from place to place in search of the Beautiful Face of Him who is revealed in His own handiwork. We discover here also that the religious life is not an even, onward flow, but a life full of surprises,—surprises of the spirit, which carry the soul by sudden thrusts forward so to say.

Viewed as a key to Brahmoism, we find in the experiences of the Maharshi the true source and fountain-head of all that is life giving and spiritual in this new movement. The basic principles of the latter, the philosophy with which it began, and that attitude of the mind which makes the acceptance of this new Truth not only possible but inevitable, are all to be met with in the spiritual adventures of the Pradhan Acharya. The faith of the Somaj grew with his faith, the spiritual fervour which has set its seal upon this religious revival took its colouring from that of his own, and the peculiar system of worship which characterises Brahmoism got its shape defined by the deeper experiences of the Seer. Indeed, the Brahmo Somaj did not stop where the Maharshi did, but though it fast outgrew the garments into which it was first put, it, however, retained the shape into which it was originally moulded by him, and the stamp of his genius is evident everywhere. Thus this first-hand recital of things of vital importance to the Brahmo Somaj is of more than ordinary interest to Brahmos, and we can only wish that the biographer had not closed his narrative at the forty-first year of his life. It would have been of the highest value to us to have from his pen an account of the differences which led ultimately to the first schism in the Somaj, and it would certainly have thrown a flood of light upon his relations with the Brahmananda. But strangely enough he stops in his narrative, and rather abruptly, just where Keshub comes in, though no mention whatever is made of

him, and we are left to solve the mystery as best we can. Could Mr. Tagore, or anyone else, enlighten us on this point?

It now remains for us only to point out that this book is a reprint of a first edition published by Messrs. S. K. Lahiri and Co., in 1909, with the Introduction by Evelyn Underhill added to the original matter. Otherwise there have been but few significant changes, excepting some in the Introductory Chapter. The footnotes indispensable in translations like this, are a little more copious in the English Edition for evident reasons. We should, however, have liked to see all the matter included in the appendix of the first edition retained in the present one, and very much regret this unfortunate and inexplicable curtailment of valuable and interesting reading. The translation is on the whole very successful, but perhaps a bit too literal. The frontispiece of the volume is a portrait of the Maharshi at eighty years of age, drawn by Mr. Abanindranath Tagore.

NIRANJAN NATHGI.

The Arya Samaj: *An account of its origin, doctrines, and activities, with a biographical sketch of the founder, by Lajpat Rai, with a preface by Professor Sidney Webb, LL.B., of the London School of Economics and Political Science (University of London). With ten illustrations. Longmans, Green & Co., 39, Paternoster Row, London. Pp. 205.*

We owe an apology to the author and publishers of this book for not having been able to notice it earlier. It is a well-written and well got-up book, and we have read it with great pleasure and profit. It is as full an account as the ordinary reader would wish to read of Swami Dayananda's life and teachings and the movement inaugurated by him. And one could not wish for a more or better informed exponent of the system—if it could be so called, than the author. The illustrations, including portraits of the founder, the author of the book and two other prominent workers, are all good. The biography at the end of the book gives a list of English books on the Samaj written by both Indians and non-Indians. The life of the founder as given in the book, is an inspiring study. We extract a passage from the end of the first chapter, where the author speaks of Dayananda's leave-taking from Swami Virajananda, with whom he had studied the Vedas:—"The day of leave-taking was a memorable occasion for both pupil and teacher. It was on that day that Swami Virajananda demanded the customary fee which in old times every *Brahmachari* had to pay to his *Guru* on the day of leave-taking. Virajananda knew that Dayananda had nothing of worldly value to offer him, nor did he himself care for any such gift. What he asked of his pupil was a pledge to devote his life to the dissemination of truth, to the waging of incessant warfare against the falsehoods of the prevailing Puranic faith (faith based on the Puranas), and to establish the right method of education, as was in vogue in pre-Buddhist times. This pledge Dayananda gave willingly, and with a solemn joy; and never was any human pledge kept more loyally and faithfully."

Dayananda's meeting with the Brahmo leaders in Calcutta is thus narrated:—"The Brahmo Samaj accorded him a hearty welcome, and some of its leading members conferred with him with a view to win his co-operation for their movement; but the Swami could not give up his faith in the infallibility of the Vedas and the doctrine of transmigration of souls, the two cardinal principles which distinguish the Arya Samaj from the Brahmo Samaj. His visit to Calcutta, how-

ever, brought him into immediate contact and intimate touch with the leaders of the English educated community. Here he learned their points of view and benefited thereby. For instance, Babu Keshub Chunder Sen, the respected leader of the Brahmo Samaj, suggested to him the supreme importance of carrying on his propaganda in the language of the people, a practical suggestion that was readily and gratefully accepted by the Swami. It was put into operation at once. This single step made a mighty difference in favour of his mission, since it brought him into direct touch with the bulk of his countrymen, both educated and uneducated, who did not know Sanskrit and could not understand him except through translators and interpreters. In Calcutta he made the acquaintance of Maharshi Debendranath Tagore, the father of the now famous Rabindranath Tagore, whose Brahmoism had more in common with the faith of Dayananda than the religious beliefs of the other leaders of the Brahmo Samaj."

The account of the educational work of the Arya Samaj and of that connected with the elevation of the depressed classes, given in the book will be found very interesting. One may not agree with the ideal or methods of education which commend themselves to the leaders of the Samaj, and the way in which they 'purify' the depressed. But their energy and self-sacrifice deserve all praise.

What one misses in the book is a reasoned exposition of the doctrines of the Samaj, specially an exposition, if any were possible, of the astounding doctrine which chiefly distinguishes the movement from the Brahmo Samaj, namely that the Vedas are infallible. That reasoned expositions of religious doctrines are not in demand in the Samaj seems to show a rather low stage of spiritual consciousness in the members. This seems to be confirmed by the utter absence in the book under notice of any account of devotional life or movements in the Samaj. If all this indicates a state of spiritual barrenness in the Samaj, as is alleged by some of its critics, then the claim put forward by our author, in behalf of the Samaj, that the future of Hindu Theism is identified with it, might be a groundless claim. However, as to the dogma of Vedic infallibility, does not the absence of an earnest defence of the doctrine indicate that the leaders of the Samaj look upon it more as a policy to attract the ignorant and the uneducated than as a serious article of faith? Some of Dayananda's critics allege that with the Swami it was nothing but a policy and that he admitted it to be so. We should have been glad if our author had taken up the point and made it clear. No movement, least of all a religious movement, can stand upon a lie—a conscious falsehood. If the Arya Samaj, its leaders at any rate, are conscious that the dogma of Vedic infallibility is untenable, in the light of science and free-thought, the sooner this is distinctly avowed the better for the moral integrity and the spiritual future of the Samaj.

S. TATTYABHUSHAN.

1. The Research Magnificent. By H. G. Wells. Pp. 406. Price 2s. 6d. Macmillan's Empire Library.

The hero of this new Wells Novel, Mr. Benham, was "led into adventure by an idea." This idea first took possession of him in his early boyhood and dominated his life to the end. That idea cannot justly be stated in a formula or an epigram but it was essentially simple. He had "an incurable, an almost intrinsic persuasion that he had to live life nobly and thoroughly." He blundered, he fell short of himself,

but he went for this preposterous idea of nobility as a linnet hatched in a cage will try to fly. He spent the greater part of his life studying and experimenting in the noble possibilities of man. This research practically absorbed all his time and interest. He conducted it in a thoroughly earnest manner and kept regular and methodical notes. When he died, his friend, White, the journalist and novelist, discovered in his rooms a whole crammed bureau, half a score of patent files, and a writing-table-drawer all full of his notes about this research.

We venture to state that this remarkable "passion for research in the noble possibilities of man" and habit of bulky and systematic note-making, Mr. Wells has borrowed for his hero from himself. We remember having seen a caricature of this talented author which simply represented him thus—? That caricature revealed the chief characteristic of Mr. Wells' mind—inquisitiveness. A biography of Mr. Wells could appropriately be published under the title which his own book bears—*The Research Magnificent*. The innumerable novels, romances, pamphlets, short stories and newspaper articles which he has written are really the notes which he has made in the course of his absorbing search for the Modern Utopia!

II. The Wife of Sir Isaac Harman. By H. G. Wells. Pp. 465. Price 2s. 6d. Macmillan Empire Library.

This Mr. Wells' latest book, represents his notes on what is now generally referred to as the Woman Question. Prominent as was this question before the outbreak of the European War, it is bound to become still more pressing after peace is resumed. During the course of the War a very large number of women have taken up positions temporarily vacated by men who are serving as soldiers or sailors. When these men come back to take up their old positions, the consequent disemployment of a large number of women who have enjoyed a taste of economic independence is bound to impart a fresh impetus to the Movement for feminine emancipation. How this Woman question would be settled, if settled at all, in the world of practical politics, we do not know. Mr. Wells, however, suggests in this book that the only thing that can solve this question for each individual woman, is—Love.

III. The Extra Day. By Algernon Blackwood. Pp. 358. Price 2s. 6d. Macmillan's Empire Library.

Mr. Blackwood, the author of this charming children's story, is indeed the possessor of a unique talent among present day writers. *The Extra Day* is the record of the adventures of a delightful trio consisting of Judy, Tim and Maria. "It is impossible to say exactly what their ages were, except that they were just the usual age, that Judy was the eldest, Maria the youngest, and that Tim, accordingly came in between the two." The children were as happy as any children can be. The only two things that bothered them were Aunt Emily who was a living embodiment of No, and Time. "Time for bed!" "Time's up!" "Time to get up!"—it was always time to do this or that, or stop doing something or other. Time was their chief enemy and they hated it with all the hatred that they were capable of. They would now and then deliberately forget to wound up their alarm clock and feel delighted to think that this would bother Time and muddle it. Their persistent efforts to get behind Time were however at last rewarded by the capture of one entire day that clocks and calendars have

failed to record. The story of this *Extra Day* makes a really delightful reading.

IV. Rambling Thoughts. By Manindra Prasad Sarvadhikari. Pp. 19. The Lila Printing Works, 14, Madan Bazar Lane, Calcutta.

A collection of poems on diverse subjects written in the poet's "younger days."

V. The Necessity for Charity Registration and Charity Organization. Pp. 23. Published by the Joint Honorary Secretaries, Zoroastrian Association, Princess Street, Bombay.

This pamphlet has been published by the Zoroastrian Association to explain a resolution passed by its Managing Committee to the effect that "there is a need in this country for an Act for the Registration of the Instruments and Properties of Public Charitable Trusts, and the regular filing of accounts relating thereto." A very useful publication.

VI. The Indian Heroes. By C. A. Kincaid, C. V. O., Indign Civil Service. Pp. 147 (Illustrated). Oxford University Press.

Mr. Kincaid has striven in these pages to re-tell the epic tales of India after the manner of Charles Kingsley. The author has achieved a creditable success in imitating the style of the master. The book gives a good outline of our national epics.

With regard to the illustrations, the author tells us, that the armour and arms and dresses have been copied from the ancient Gandhara sculptures and the bas-reliefs in the ancient Vihara at Bhaja. "These sculptures date from 200 B.C to A.D. 100, and were therefore more or less contemporaneous with the last recession of the Indian epics." We are glad that in these illustrations the heroes and heroines have been represented as "fair men and women of an Aryan type", but must confess our inability to recognize in the clean shaven figures of these illustrations some of the heroes, like King Dasharatha, with whom our imagination has made us familiar from our childhood.

G. S. MONGIA.

MARATHI.

"Reminiscences of our life," by Mrs. Ramabai Ranade.

Fifteen years have rolled by since a mighty wave of grief swept over this great continent from one end to the other at the news of the death of Mr. Justice Ranade—the man of the age—in the widest and highest signification of that expression. "Such a man is born once in an age" was truly said by the late Mr. Chatfield of the great Maratha leader of the latter half of the 19th century.

As there are certain epochs in the world's history that stand out distinct and prominent, signifying great changes, forming mile-stones, indicating the distance run by the race, so do we mark at long intervals, the appearance of great men upon the stage of the world with whom great movements are identified, and who stand out as turning posts, guiding the humble pilgrims on their way through life. Their appearance does not seem to be the result of mere accident or a casual phenomenon but the sequence of an inscrutable moral law. Such men appear like migratory planets in the firmament; they illumine the skies for a short while and then pass away.

Since the down-fall of the Peshwa's government in 1818, up to the year 1857, the history of Maharashtra presents a perfect blank. It was a period of national prostration such as always supervenes

REVIEWS AND NOTICES OF BOOKS

the final extinction of one nation by another. The old order had disappeared while the new order had not yet assumed any definite shape and form. The work of setting the country had only just commenced when the avalanche of the mutiny convulsed the country, North and South, East and West.

The Western Presidency entered upon an epoch of peace and uninterrupted progress immediately after the storm of the mutiny had subsided and the government of the whole of the Peninsula passed into the direct hands of the British Crown. With the establishment of the Universities, and the foundation of schools and colleges, the flood-gates of Western knowledge and learning were thrown open, and men were wanted who could with discretion direct and guide the floods into the proper channels. Amongst the batch of young men who were the first fruits of Western education and enlightenment brought out by the University of Bombay was top most the men who subsequently came to be known as the "Prince of Indian graduates," and whose death has left a void which it may take another century to fill up. It is our national misfortune that a full and complete biography of such a great man should yet remain unwritten. The late Hon'ble Mr. G. K. Gokhale, who was the disciple and pupil of Mr. Justice Ranade, intended to write out the life of his great master, but unfortunately, that brilliant and versatile man was cut off in the flower of his manhood and in the midst of his multirarious activities, and what he wished to be his magnum opus remained an unfulfilled pious desire, to the irreparable loss of India and Indian literature.

We have however now one valuable book, the first of its character, written by an Indian lady Mrs. Ramabai Ranade, in Marathi, styled "Reminiscences of our life" which throws valuable light on her husband's domestic and daily life. This book written in Marathi is accessible only to a very limited circle of the great man's admirers and followers who are legion, scattered over the length and breadth of this country, and it is to be devoutly hoped that this precious book will before long be translated into other vernaculars, or published in English garb, so that all India may have the benefit of the priceless information it contains.

Mrs. Ramabai Ranade has published a charming picture of the blissful domestic life of her husband, and the book is not only a work of art in Marathi literature, but it is a work which deserves a place on the shelf of every Indian patriot as it throws valuable side light on many public movements of the latter half of the 19th century which owed their inception and inspiration to Mr. Justice Ranade. As the late Hon'ble Mr. G. K. Gokhale in his foreword to the book observes "Rao Sahib Ranade is considered as a great man, not only of this country but of the world, not merely because of his towering genius, his learning, his scholarship or his patriotism, - all uncommon qualities, any one of which would have made the name of any other man famous in the world - but beyond all this, his uncommon extraordinary saintly life seemed to indicate that there was a part of the God-head in the man who if he had been born a few centuries before would have been considered an incarnation of God-head itself."

The peculiar charm of this book consists in the sweet frankness with which Mrs. Ranade has drawn aside the curtain and revealed to us the domestic and work-a-day life of her revered husband. We turn page after page enthralled in reading the story of the young handsome wife as she tells it in her own graceful style, how she started her lessons from the A.B.C.

in the face of bitter persecution and obloquy, what trials she had to pass through for organising and attending public meetings in those days which inaugurated the period of succeeding emancipation and reform, how the young wife strove to carry out her husband's behests under the baptism of fire, how she devoutly followed his noble precept of 'Bear and forbear,' and how in the procession of the years she gathered from her inspired husband the harvest of wisdom and the rich lessons of life.

Many of us know Mr. Justice Ranade as a man of tall majestic stature and broad forehead, massive intellect and towering genius and deep scholarship, but here we see him pictured as a serene *pater familias* with a temper always calm and unruffled even in the midst of storms and strife, a husband whose silent and deep love and devotion for his wife never wavered or faded, a patron of poor and deserving students for whom his charity and purse never stinted, a friend who never knew misunderstanding, envy or jealousy, a master who was kind and affectionate to the meanest of his servants once and for all time, a leader of men and a saint among men.

It is not possible in a cursory review of this book to convey any adequate idea of its beautiful style, its rich store of information, the lights and shades of pathos, and sublime human dignity it presents to those who have unfortunately missed the privilege of coming into contact with and under the magnetic checking influence of the great saint of the 19th century, but to those like myself who have had the rare good fortune and privilege of passing their tutelage at the master's feet, this book reads like a living romance of the wedded life of a great sage and his saintly spouse.

Mr. Justice Ranade believed in our redeeming power, our remoulding energy and in our approaching triumph through love, knowledge and labour. This book gives us some idea of the incessant thought for his country and his countrymen, that agitated Mr. Ranade's mind even in his most private moments. We are now in the midst of one of those epochs during which the race passes from one stage of evolution to another and in this transition period, we cannot do better than study and follow the pure and high ideals held up and sanctified in life by men like Mr. Justice Ranade. Happy indeed are those who in the swirl of conflicting tendencies, can by following his light, help to make the world they are born in, better and happier, and to all sincere Indians who wish to live up to the true dignity of their manhood and translate their love for the country which gave them birth, into their conduct and action, I can commend no better book than Mrs. Ranade's 'Reminiscences of our life.'

D. V. KIRTANE.

HINDI.

Practical Photography by Mr. Harigulam Thakur. Printed and published at the Bharat Prakash Press, Goruckpore. Crown 8vo. pp. 164. Price—not mentioned.

The characteristic feature of this book is that it has paid much more attention to an attempt towards imparting a practical knowledge of the art of photography. It has not, like some English books on the subject, confined itself to an elaborate discussion of theories. We must say that the publication will be of immense usefulness to both amateur and professional photographers. The author is himself a successful

photographer and is the Manager of the Fine Art Photographic Studio, Goruckpore. We commend the language of the book, as being free from mistakes and aptly suited to the subject discussed.

London kai Patra by *R. Brahmohondal Varma* of *Chhindwara* and published by *Mr. Nathuram Pannikar*, at the *Jain Granthi Ratnakar Karpalaya, Mirabai, Bombay. Crown 8vo. pp. 52. Price—As. 30.*

These are translations of certain letters of Lala Sagar Chaud. B.A. at Law, sent from London to certain English and Urdu periodicals. The letters are very useful and informing and the subjects treated most appropriate. The writer was well-advised to give in the course of letters, addresses of some of the best publications (books and journals) of England. In other ways too the utility of the book cannot be questioned: and it is both instructive and interesting. The translation has been good and the language is not defective. Only on the first page we find an incorrect word अशुद्ध where the *dirgha* is incorrect.

• **Ramayani Katha** by *Mr. Bhagwan Das Hallia* and *Pandit Vairamath Sharma Vaidya*. Printed and published at the *Abhyudaya Press, Crown 8vo. pp. 241. Price—Paper Cover Re. 1; Cardboard Cover—Re. 1 4-0.*

This is a translation of the well-known book of the same name by the famous author of the History of Bengali Literature, Shree Dinesh Chandra Sen. A review of the book by Dr. Rabindranath Tagore increases its value. The book itself is certainly very useful, and the way in which the story of the Ramayan is depicted is really charming. The chief characteristic of the book is its simplicity of narration and rationalisation of the topics dealt with. The translation too has been fair, but we must say the translators betray an incompetent knowledge of the Bengali, though this has not much marred the tone of the translation. The language is satisfactory. There are stray mistakes here and there; but these may be due to typographical negligence.

Tap by *Mr. Praim Ballabh Joshi, B. Sc.* Printed at the *Leader Press, Allahabad* and published by the *Vigyan Parishad, Allahabad. Crown 8vo. pp. 61. Price—as. 4.*

• This series under the august editorship of Mahamahopadhyaya Pandit Ganganath Jha, M. A., D. Litt, promises to prove of eminent benefit to the Hindi reader. The language is not very learned. But this is rather creditable to the publication, which has the merit of being written by one who understands his subject well. In Hindi most of the books on Science are translations. This mars their utility considerably, in that the sense is never so clear in these translations. When an original writer, however, writes a book of the nature under review, we must welcome it. The get-up and printing of the book are very nice.

Dadabhai Naoroji by *Pandit Rameshwar Prasad Sharma*. Printed at the *Commercial Press, Juhu-Kalan, Cawnpore* and to be had of the author at the *Charitmal Office, Juhu, Cawnpore Foolscap 8vo. pp. 38. Price—as. 2.*

Such short booklets will form novel features in the

Hindi Literature and will remove a long-felt want. We doubt not they will become deservedly popular. Books like these deserve wide propagation and some patriotic gentleman should take up the work of purchasing a number of copies of these and distributing them among students and others. The life of the great Indian patriot has been concisely dealt with in the book and there is nothing that is uninteresting. The language and get-up are also good, and there is a portrait in green of the Grand Old Man on the title-page.

Bharatiya Shasan Paddhati, Part I., by *Pandit Ambika Prasad Vajpai*. Published by *Pandit Pratapnarayan Vajpai*, 30, *Shreenath Ray Lane, Calcutta. Crown 8vo. pp. 103. Price—as. 8.*

We always hail with delight such books which make a departure from the trodden path of the Hindi Literature. In this publication the existing constitution of the Indian Government with all its branches, has been described, no remarks being passed on its actual working nor on the reforms needed. In his short sketch the author has carefully managed to put a great deal of information and in fact the book goes to even minute details of district administration. The language is pure and grand; and the get-up of the book is all that could be desired.

Samrata-shubhagamana, by *Shree Rajendranath Pandit* and to be had of (a) the author at *Sam Savai Mandir, P. O. Dabhoi, Baroda*, or (b) *H. M. Mehta, P. O. Bhadarwa, Dist. Kaira (Gujarat), Demy 8vo. pp. 175. Price Re. 1.*

Loyal poems composed on the occasion of the coronation of His Majesty the King-Emperor, have been incorporated in this book. Besides the poems which are in Sanskrit and Hindi (three being in English as well), a historical account of Delhi from the earliest times has been given, which comprises a succinct and at the same time full information, extending over twenty-eight pages. Next follows a description of the actual coronation and some account of the royal family. A brief reference is also made to what was done in the remote parts of the country on the occasion. Several magazines and newspapers have been laid under contribution for the collection of the poems, and the get-up of the book, with its nice binding, is satisfactory. The prose part of the book is defective in its language.

Pagal Manushya Ke Katha, by *Shree Kaishava Lal Sen of Gogri (Monghyr). Crown 8vo. pp. 12.*

This is a religious book on Vaishnavism and deals with its sentimental aspect. It is unpriced, any suitable contribution being left to the discretion of the public. To the religiously-inclined the book will be pretty interesting. Its language is, however, very defective: and the strange thing is that a few pages of it swarms with mistakes, while the rest of it does not contain so many.

Venisanhar ki alochana, by *Pandit Badrinath Bhattacharya, B.A.* Printed and published at the *Rambhooshan Press, Agra. Crown 8vo. pp. 80. Price—as. 4.*

A book of original criticism is a novelty in the field of Hindi Literature, and we value Pandit Badrinath's book especially on this score. The only noticeable defect in the book is that the author has often gone to minor details which do not read well in a book of

this nature. In other respects, we can but commend the author and he has brought into play much originality for which he must be given credit. The language and style are dignified and the criticism shows a clear grasp of the "Venisanhar." The author thinks that a criticism of the characters in the drama does not fall within his scope and though he has, according to his own view, committed the error of criticising the characters, we do not concur with him and think that he has been within his legitimate sphere.

Apna Sudhar, by Pandit Narvada Prasad Misra. Published by Lakshmidhar Vajpai, Bag Muzaffarkhan, Agra. Crown 8vo. pp. 101. Price—rs 5.

We have long had a number of such translations of standard and popular English books into Urdu, but the Hindi writers have begun to direct their attention to this prolific field only lately. The book under review is an adaptation of Blackie's *Self-Culture*: the author has not been very wrong in not giving a wholesale rendering. The adaptation has been satisfactory and has been on the lines of Mr. John Stuart Blackie, the original author, whose short life has also been subjoined. It goes without saying that the book will be of immense good to any student and should be popular in Middle and Training Schools. We have no comments to offer against the language or style of the book.

Santabanisangraha, Parts I. to II. Published by the Manager, Belvedere Press, Allahabad. Royal 8vo. pp. 248+256. Price of each part—Rs 1-2.

These publications will be very much prized by a certain class of people, especially in villages. Who have often a store of these semi-religious sayings which they reproduce from memory. Nanak, Kabir, Mira Bai, Daria Sahab, and similar other saints have been laid under contribution; and the compiler has taken care to give in the footnote the meanings of difficult words in the body of the book, as also short lives of the different saints. The compilation has no doubt been made on up-to-date lines and the Belvedere Press has to be congratulated on taking the publication in hand. The two volumes have a historical significance as well and they are not devoid of considerable literary worth.

M. S.

GUJARATI.

(1) **Theodore Parker**, by the late Narayan Hem Chandra, published by the Society for the Encouragement of Cheap Literature, printed at the Diamond Jubilee Printing Press, Ahmedabad. Cloth bound, pp. 208, 2nd Edition. Price Rs 0-8-0 (1915).

(2) **Mahan Sikh Gurus**, by Kallianji Vitthalbhai Mehta and Chumlat Ramchandra Shelat, published by Do., Printed at Do.: Clothbound, pp. 212. Price Rs. 0-14-0 (1915).

(3) **Tunki Vartao**, Part III, by Kallianji Vitthalbhai Mehta, Do Do. Clothbound, pp. 203. Price 0-6-0 (1915).

The first book is a biography of the well-known American, Theodore Parker. It was originally written by the late Narayan Hemchandra, whose quaint language has in this edition been touched up here and there.

The second book comprises the lives of two famous Sikh Gurus, Nanak and Govind Singh. They are based on various Hindi works.

The third book contains a number of short stories culled from the same source.

All the three books are highly readable and sure to prove popular.

Is it possible to teach in India according to the Montessori system? By Shambhuprasad Shrivastava Mehta, B.A., printed at the Bombay Samachar Printing Press, Bombay. Thick cardboard, pp. 50. With illustrations. Price Rs. 0-8-0 (1915).

Mr. Mehta having propounded the above question, answers it in the affirmative and has shown several methods which can be adapted to the needs of India. This, we think, is the first attempt in Gujarati in this direction. As to how far this system can be successful in practice, one can not say at present.

Sahitya Seva of Kavi Narmadashanker, by Chhotalal Kalandis Patel of Surat, printed at the Jaina Vijaya Printing Press, Surat. Paper C. pp. 82. Price Rs. 0-4-0 (1915).

This is a Prize Essay passed by the late Sahitya Parishad held at Surat. The writer is a school master, and he has according to his ability reviewed the services of the late well-known Kavi Narmadashanker to the literature of Gujarat. We have read this little essay with great pleasure, and have found in it efforts made by the writer to deal fairly with and view both sides of the Kavi's work.

Adarsha Bhuta Jivan, by Prabhashanker Jayashanker Pathok, of Bombay, Printed at the Jnan Mandir Printing Press, Ahmedabad, Paper Cover, pp. 55. Price Rs. 0-4-0 (1915).

This is another Prize Essay, passed at the same Parishad. As its name implies it tries to depict what an ideal life is and should be.

Hari Yasha Gita, edited by Jayendralal Bhagvanlal, M.A., and printed at the Satyanarayan Press, Ahmedabad. Clothbound, pp. 160. Price Rs 1-4-0 (1915).

This is a collection of poems written by a lady, Gangaswarup Jasha, on such subjects as Jnan, Bhakti, Varagya, &c. They are published by her son, who has written an introduction, in which he defends the diversion of the energy of Indians towards such subjects as have furnished materials for his mother's work. The poems themselves are couched in the old orthodox style and bear testimony to the study and thoughtfulness of the lady writer. The price is out of all proportion to the work.

K. M. J.

We have received an annual called the *Jnati Patra Varshik*. We do not review Magazines.

TWO PANJABI PLAYS

“THE Irish plays.....make one feel that there is a real future for the stage, and that one day we too may have a National drama which will show us the lives of the people with their sorrows and joys, their heroisms and cowardices, instead of the mere tinselly abominations which just now make theatres the despair of moralist and philosopher alike.”

The above lines are quoted from a dramatic criticism which appeared in “The Herald,” an Australian newspaper, about four or five years ago.

Here in India, the theatre is tinged with the same “tinselly abominations” as in Australia, as indeed in every other country where so-called civilization raises its head.

Here in India, if one criticises current dramatic methods, one is told that the Indian theatre has become westernised. What a pity. Or if the theatre is bent on westernising, let it discriminate. There is much that is worthless in western methods, but there is also much that is good. We might, for example, with advantage take a leaf out of the book of the Abbey Theatre, Dublin. Irish plays, by Irish authors, about Ireland, for the Irish people. Why not Indian plays, by Indian authors, about India, for the Indian people? It reads quite well.

A start in this direction has indeed been made in the Panjab. A stage society has been formed named after the Goddess Saraswati and the two Panjabi plays with which

Group in “Dina's Marriage Procession” with Rehma, the barber, standing at the back.

A group of Jats in "Dina's Marriage Procession" Manu Bodha, the bearded man in the centre was played by Mr. Raj Indro Lal Sahni, the author of the play.

this article is about to deal were recently produced by the Saraswati Stage Society. A triple bill was presented. "Spreading The News" by Lady Gregory, of the Abbey Theatre, Dublin. "Dina's Marriage Procession" by Raj Indro Lal Sahni, and "The Bride" by Ishwar Das Nanda. Both of these young Indian authors are students of the Panjab University and graduated last May. Their plays promise well for the development of the aims of the Saraswati Society, and prove that there is artistic vitality in Young India.

"Dina's Marriage Procession" was the author's first attempt at play writing. It is full of humour and rich with local colour. Dina, a young Mahommadan is to be married, and when the curtain rises the festivities are taking place. The final ceremonies have to be gone through before the marriage procession starts for the bride's home. Dina and his friends are squatting round the friendly hookah gossiping. They praise Dina for his lavish marriage entertainment, at least the young ones do, the older men criticise and try to restrain him. But Dina

is very proud of the good name he has already made in the neighbourhood and intends to go on as he has begun. Mai Bakho is cooking at an open air fire and occasionally joins in the conversation. Enter to them one Nika Shah, the village *bannia*. Nika has not been invited to the feast and gets a poor welcome. He makes no secret of having come to get his accounts settled. The idea shocks even the cautious old men who have been criticising Dina. Whatever happens the marriage celebrations must proceed. Let the *bannia* settle his claims after. This he refuses to do and even demands the family jewelry in payment. His rapacity (the rate of interest on money already lent to Dina is exorbitantly high) puts every one's back up and by degrees a violent quarrel develops. Insults are hurled from side to side, and eventually Dina who is a hot headed youth, belabours the *bannia* who rushes off to report to the police. An especially severe and self-important *havildar* is in the village and the villagers know that if this particular police

The Bannia and the Jats, with Mai Bakho to the right, in "Dina's Marriage Procession"

officer gets mixed up in the affair, it will go badly with Dina. So they hurry on with the marriage ceremonies hoping to get the procession on the move before the police have had time to arrive. Women approach singing a *gharoli* song and take the bridegroom off to the inner courtyard for his ceremonial bathing. Meanwhile the men press on feverishly with other ceremonies. Presently the bridegroom returns with the women in procession, and another song is being sung. The *chuni*-breaking takes place and a *sehra* is wound round his turban and the women retire. A necessary collection of monies is then made, after which the barber is hurried off for the bridal umbrella and the horse for the bridegroom. The barber quickly returns bearing the umbrella, his son is saddling the horse. The company rise in haste to be off when they are confronted with the police officer of whom they are in such dread. The *havildar* followed by the enraged *bannia* makes full enquiries. Dina's friends plead for him and eventually offer

to bribe the police to inaction. They are just about to come to a satisfactory arrangement, when Dina's fury is aroused. He is sick with his friends for ingratiating themselves with the police, he thinks that a great deal too much fuss is being made over a very simple matter. He has neither broken into any man's house, nor has he killed any person; and who are the police? "They are not gods that we should lay our heads in the dust before them?" The *havildar* who had been on the point of relenting, changes his tone and has Dina arrested. The old mother rushes in and throws herself at the *havildar's* feet, and a stormy scene follows in which Dina heaps fuel on the fire, and after a fierce struggle is led off, the men following in great excitement, the women following wailing. The last to go off is Mai Bakho, supported by women, striking herself and lamenting. Here is a vivid picture of Jat life treated with a perception of the picturesque which is as refreshing as it is rare on the Indian stage. The dialogue is typi-

cal of the particular villagers dealt with and reveals also a pleasant drollery in the mind of the author.

"The Bride" is a totally different play. The curtain rises on Kauran, spinning. She is gossiping with an old woman, her little daughter Lajo, aged six, is seated on a *charpai* playing with dolls, and Lajo's big sister, Melo, aged seventeen, is sitting close to the *charpai* on a *piri* embroidering a *phulkari*. Melo is the subject of conversation. The new custom of marrying girls late does not meet with the approval of the two women, and Kauran is being instigated to

Barberess, Kauran, and Lajo, in "The Bride." Barberess was played by Mr. Ishwar Das Nanda, the author of the play.

Melo and her friend Basanto, in "The Bride."

worry her husband, Hushiar-chand, on the point, which later on she does, and is told by him that an arrangement has now been made. In answer to Kauran's catechising he gives vague answers but assures her that all is well, laying stress on the fact that the chosen bridegroom has money and lands, saying that "a cow should be tethered where there is plenty of grass." It remains for a barberess, who later on visits Kauran, to divulge the fact that the chosen bridegroom is a decrepit old man, wealthy it is true, but one who is marrying to spite his sons with whom he has quarrelled, and Kauran now realises that her Melo is to be sacrificed. In a violent quarrel scene with Hushiar-chand she refuses to allow Melo to be married, but he eventually wins her over and shows her a bag of money he has already received from their prospective son-in-law. After

Hushiar Chand, Kauran and Lajo, in "The Bride."

the first, recoil, the sight of so much money reconciles Kauran. Meanwhile Melo has learnt of the fate in store for her and aided by a friend, runs away. The marriage procession is on its way. Hushiar Chand foreseeing trouble with his wife had already completed the arrangements swiftly and secretly. When the time comes for Melo to be seated at the *lawan* she is nowhere to be found. They call for her in vain, meanwhile the *pandar* of the other party is shouting at their door and telling them to hurry. Still no Melo. Still the insistent calls of the *pandar*. Now what shall they do? They will be disgraced! Kauran weeps. Hushiar Chand storms. "Melo! Melo!" No answer. The *pandar* calls again. The bridegroom's party is growing angry at the delay. "Coming, just coming!" desperately cries Hushiar Chand. Then he turns to his wife. What to do? What to do? Whom to seat at the *lawan*? Quick, put the red *sahu* on to Lajo! She is forth-

with enveloped and snatched into her father's arms who carries her off kicking and crying "My dolls, my dolls! Let me play with my dolls!" Kauran mad with grief, follows. This play is also the first rapid outgrowth from old customs is rich with problems and with the conflict necessary for drama. Then too the marvellous beauty of India. It is not to be expected that those who have never known anything else should be acutely aware of its reality, but the faithful representation of Indian life on the stage necessarily results in beauty, and it is just possible that thus an aesthetic consciousness will be developed that may help to arrest the wholesale westernising of Indian life. However, be that as it may, quite apart from ultimate tangible results, the actual production of absolutely Indian plays justifies itself. It is a mistake to give reasons for undertakings of this kind. That possessing the qualifications and the desire one is compelled to participate, is perhaps the best reason

to give, leaving results to take care of themselves. Unfortunately the theatre in India, as in other countries, has a bad reputation which it undoubtedly deserves. But it is for this very reason that we cannot afford to ignore it. The theatre wields immense power, since it has a great formative influence. Not only may it influence the taste and aesthetic sensibility of a people, but it may influence their very outlook on life. Then it is democratic. It is, if ever an art was, the art of the people. The most illiterate, presupposing moderate intelligence and an understanding of the language spoken, might acquire knowledge and a critical faculty, otherwise denied to them. The spirit of a people must be nourished, and take it by and large, the finest nourishment for the mind is ideas, and where could one find a better field for the broadcast sowing of ideas than the theatre?

NORAH RICHARDS.

Notes.—

Banua—A village shop keeper and money lender, usually a Hindu.

Havildar.—Head Constable.

Gharoli song.—The *gharoli* is an earthen water vessel much decorated with coloured and gold papers. It contains water for the ceremonial bathing of the bridegroom. Women sing an appropriate song as it is carried in procession.

Chuni-breaking.—A *chuni* is an earthen lid of the water vessel, which the bridegroom breaks with his foot after the ceremonial bathing. This act is considered auspicious.

Sehra.—A long fringe of jasmine flowers and roses, which is bound round the bridegroom's turban and forms a veil before his face.

Chhapai.—A string woven bed of very simple structure, literally, four legs.

Piri.—A very low string-woven stool with four legs, made in the same simple fashion as a *chhapai*.

Phulkari.—A head drapery, the whole surface of which is embroidered with flowers, usually yellow silk is worked on an Indian red ground. The meaning of *phul* is flower, and *kari* is a suffix equivalent to work.

Lawan.—The circle round a sacred fire at which are seated the bride and bridegroom with their guardians and relatives for *Phere*. *Phere* is the final and binding ceremony of a Hindu marriage, during which the bride and bridegroom with their robes knotted together seven times circumambulate the sacred fire, while the brahmin chants the *mantras* which contain the duties and obligations of the married pair to one another.

Laudar.—The brahmin who performs the priestly duties in the marriage ceremonies.

Red salu.—A red head drapery worn by the bride at the marriage ceremony.

ROUND THE WORLD WITH MY MASTER

BY A DISCIPLE OF PROF. J. C. BOSE.

IN 1911 I had the supreme privilege of being accepted as a disciple by my Master; since then not a day passed that his disciples did not come face to face with wonders which grew greater and greater every day. The Master came round in the morning and talked to us and laid down the programme for every day. He would often give us a sealed envelope, containing the results he foresaw of new experiments, and to our great astonishment we would find how everything came out exactly as he had anticipated. We thus came to realise the difference between aimless drudgery and the true insight which comes after years of struggle. Some of the results were so astonishing and so completely against existing theories that the foremost scientific paper, *Nature*, after paying the highest tribute for his wide outlook and great

generalisations, and also for his marvellous power of invention, was yet constrained to add words of caution, that the result of Dr. Bose's researches "would be of the highest value did it not continually arouse our incredulity." This frank statement proved to be of great use, since it clearly described the state of existing knowledge, and the absolutely novel character of the Master's conceptions. In other instances his theories have been quietly accepted and given out by different compilers as their own. A glaring instance of this is seen in a certain article in the *Encyclopaedia Britannica*. I may be permitted to anticipate what comes afterwards by saying that it took nearly six years for *Nature* to be completely converted, when it devoted an article ten columns in length describing the extreme importance of the Master's discoveries.

I was, however, speaking of the time when his theories were fiercely assailed because the result challenged belief. How to convert the world? He realised that controversies led to nothing. Finality lay only in an appeal to Caesar, in this case to the spirit of the plant! Would it ever be possible to have the unknown inner history of the plants revealed by scripts made by themselves? This has been his unceasing quest for many a year. Even in his ordinary conversation with friends and pupils one would realise that the mind behind was working quietly and sometimes we could catch a glimpse of sudden illumination in his face. His thoughts had become sub-conscious. The obstacles which stand in our way and all false perspective had vanished for him. Discoveries came almost spontaneously and new inventions were like play to him.

We were impatient at the world's slow recognition of his work. If others could only see as we did! The Master was amused at our impatience. To him it had become almost indifferent whether he won recognition or not. The only thing that did matter was whether he pursued truth to the utmost. Our impatience, however, must have slowly influenced him, for one day he said, "I will have to do it, but that would mean long conflict of practically one man against the world." The odds were after all not so great if one was in the minority with truth.

The Master had now perfected his self-recording apparatus and plants now registered their autographs. A demonstration of the actual record of the plants before the scientific world in the West could not but be most convincing. This was, however, no easy task; the only time when plants flourish in Europe is in the middle of summer, when every place of learning is closed for the vacation. For the rest of the year there is nothing but bare stems, the plants having gone into a state of tranced hibernation. How then was this difficulty to be met? Nothing short of carrying our own plants and risking their frail life to the inclemencies and danger of the journey.

His mind became troubled with all these difficulties. He must have thought of me in this connection, but had fears that a superficial contact with the West for a short period might prove for me very unsettling. I distinctly remember the morning when

turning to me with mingled affection and pity he spoke of all his hopes and fears. What could I do or say? Neither did I know my strength nor my weaknesses. I could only throw myself into a raging sea if that would serve him. That is all a disciple could do. But the Master always showed displeasure when we attempted to voice our personal devotion. He wanted no weakings, but wished to forge men who could work and grow to their utmost stature. He was never tired of impressing on us the fact that the sum total of energy was constant; when that found vent in talk there must be the inevitable run down of latent energy of character. About my going, the Master said that he would take the risk and ordered me to be ready.

The Mimosa which toured round the world with Prof. J. C. Bose.

Once the course was decided the Master rapidly made his preparations. He now seemed all energy, and his ideas were definite even to the minutest detail. Every thing that might possibly be required, from an ordinary pin to his most complicated apparatus, were then packed in

The Interior of Dr. J. C. Bose's Laboratory at Maida Vale, London.

portable boxes. All our brother disciples were lost in the joy of preparation. My own part was to learn from them the peculiar difficulties of each apparatus and the way to overcome them.

Plants had to be personally carried by hand. No more than four specimens could be taken,—two of *Mimosa* and two of our *Bon chanral*, *Desmodium gyrans* or the Telegraph Plant. We had fairly good specimens of the sensitive *Mimosa*, but the telegraph plant was out of season, its best time being from July to November. It was March now, and the plants had seeded and died. After much difficulty I got a small sickly-looking specimen. Casually I heard from the doorkeeper of a neighbouring house that he had a wonderful plant which drove out ghosts! And on going out to investigate I found that it was nothing less than my long sought telegraph plant. The specimen was good-sized and was in a vigorous condition. I convinced my superstitious friend how our national future depended on this plant. He, though unlettered, rose to the patriotic demand. But

fearing that his fit of generosity might not last long I looked about and found a cooking vessel. I converted it into a flower pot and marched home with the valued treasure. I placed it in the quadrangle of my small house and carefully watered it. I could hardly wait for the morning to see how the plant fared. Alas! an unscientific cat trespassed into our house at night and ate the top off and broke the main stem into half. The plant looked very lame. But even the lame can scale mountains through faith. And I had enough for two.

The Master went by the quicker overland route. I travelled by sea all the way by s.s. "Egypt" from Calcutta. The companions of my journey were: two *Mimosas* fairly vigorous, two telegraph plants, one weakling and the other lame and halting. This was the strength of the expedition that went out to meet the hostile shock of the world. I had no misgivings of the ultimate victory. I knew my Master and the flag he carried.

Sensitive plants have a strange fascina-

tion even for grown up children. Every student who passed by our laboratory could not help stopping to watch the leaves close as they pinched them. This did not matter in India, where we had many plants to spare. To protect them from the too ardent attentions of the children during the voyage, a little cage of wire gauze was made. The captain knowing their destiny offered special help. The standing joke every morning was to inquire after the health of the "canary" in my cage!

Life on board a steamer is certainly delightful, provided one escapes the much dreaded sea-sickness. I was fortunate in this matter and I could spend my time in reading and looking after the plants. From every passing port a detailed account of their condition—health and temperament—was sent to the master. It was a full four weeks' experience of varied character, in which the disciple found himself now in the heights and then in the depths, as the plants showed signs of thriving or drooping. To my great delight the lame one put forth two green sprouts. I took this as a good omen.

As long as the ship ploughed through the Indian Ocean the plants thrived as though they were in their own familiar soil. During the journey through the Red Sea they bathed in the sunshine and enjoyed the warmth. When we entered the Mediterranean there was a sudden chill and the plants became depressed and the leaves drooped. As we proceeded further West the weather became colder and colder, and when we reached the Gulf of Lyons I was greatly discouraged by the fear that I might not be able to carry my charge alive to their destination. The Bay of Biscay, I was warned, would prove to be quite fatal. The only thing I could do was to wrap the cage with blankets and expose the plants only to the brief flashes of sunshine when they appeared.

After the long voyage we at last reached London. The Master had already arrived a few days earlier and engaged a beautiful house in South Kensington. He had carried with him two boxes of his most delicate apparatus. The one he carried with his own hands was quite safe. But the other box had to be entrusted to the care of the Railway porter; the result was that these instruments which had survived the perils of the sea succumbed to the rough handling of the

British workman. There remained now only two instruments, The Resonant and the Oscillating Recorders, but the wonderful Crescograph which instantly recorded the infinitesimal growth of plants was ruined beyond repair. However, the first two instruments mentioned above proved more than enough to serve our purpose. These extremely delicate instruments, after the inevitable shaking to which they were subjected during the long journey, required certain repairs and readjustments. Fortunately there was in London one of Master's old pupils, Dr. Jyoti Prakas Sircar, who had his training under him for several years before he left India. His help was now almost invaluable for our present needs. Under his treatment the instruments regained their sensitiveness.

My own trials with the plants really began from the moment of our arrival in London. The day was quite dark,—at the end of April, and extremely cold, though the season was supposed to be summer. I carried the plants in a closed taxicab and placed them carefully in the drawing room, kept warm by incandescent gas heating. I hoped that we had reached safe haven at last. But the next morning going to look for the plants all my hopes were crushed to the ground. I never realised,—though my Master's works should have prepared me for it—how deadly poisonous gas fumes were to vegetable life. The four little plants which I succeeded in keeping alive so long under unexpected difficulties were to all seeming dead, and this through my own lack of foresight. The leaves hung down quite limp and the leaflets had turned yellow. After trying various expedients I was successful in reviving two, the other two being quite dead.

Now we were faced with the hopeless difficulty of keeping these two plants alive, specially through the night. If kept inside, they would be poisoned by gas, if kept outside they would be frozen to death. In this emergency the Master took steps that removed all my anxieties. He called on the Director of the famous Royal Botanic Gardens at Regent's Park, who had already heard of the wonders of the new discoveries. Every help was enthusiastically offered and we were taken into the hot house made specially for tropical plants. London with its fog and freezing temperature had greatly depressed me. But once I entered

the hot-house I felt transported as if by magic to my dear native land. How I enjoyed the intense moist heat which I did not at all appreciate while in India. But there were other wonders; the tank was full of Indian lilies in full bloom; there was the rice plant, the stalk bending under the weight of corn. And more wonderful still was the vigorous banana bearing ripe fruits. The two little sickly plants which I brought at once realised that good time was coming. Mr. Kelp, Superintendent of the Gardens, promised personally to look after the well-being of the strangers. And wonderful to relate, from that day onward they began to grow and flourish, as if they realised that great things were ex-

the *Times* devoted to the subject a long column under the heading

Rare Plant at the Botanic Gardens.

"Among interesting plants growing in the Victoria Regia House are a banana in fruit, the sacred lily of the East, *Nelumbium speciosum*, sugar cane and rice. A plant rarely to be seen in this country, *Desmodium gyrans*, the telegraph plant, has lately been received from India and is now growing in the same green house. The interest of this plant has been greatly increased since it has been found by Professor Bose that the pulsations are automatic, and that the leaflets respond in exactly the same way as the hearts of animals to stimulants, poisons, and electric shock."

The *Desmodium Gyrans* (বন চাঁড়াল) which toured round the world with Prof. J. C. Bose.

pected of them and that they were determined not to disappoint us. In showing us this kindness, the Botanic Gardens, we were glad to find, were also benefitted. Soon people began to talk of Master's great work and they flocked to Regent's Park in crowds to see the wonderful specimens that had been brought from India. The interest was so great that

The next point to be decided, was a suitable house for a Laboratory; we had to think not so much of our own comfort, as of the health of the plants which were to be brought every day for experiment from the Regent's Park and carefully returned. Any house with gas supply had to be rejected, so also houses on streets with too much motor car traffic, since the product of combustion of petrol was poisonous to the plants. At last the Master secured a beautiful house in Maida Vale, with a large garden attached. The best room in the house, the one in front, was set apart for our laboratory. The photograph reproduced on page 83 gives an idea of the interior of the laboratory: to the right is seen the large curtained glass window, with plenty of sunlight; here on a steady table was mounted the Resonant Recorder for automatic registration of the rate of nervous impulse in plants. Near to it is the white screen on which was projected by means of electric lantern the pulse records of the Telegraph plant, as registered by the Oscillating Recorder. These are seen on the mantel piece to the extreme left. In the centre was placed the galvanometer to register the electric response and pulsation of plants. Still further to the right is the Death Recorder by which the plant's signals its death at the exact critical moment. With all these instruments adjusted to their utmost sensitiveness we were ready to face our critics. And the next few weeks called forth our highest activity as the leading men in England began to flock to the Maida Vale Laboratory which was soon to attain historic importance.

(To be continued).

SYED MAZHAR-UL-HAQ.

SYED Mazhar-ul-Haq was born on 21st December 1866 in the Chapra District of North Bihar, and his genealogy goes up to the noble Quraish family of Mecca which had opposed the Arabian Prophet so long and then submitted to his sway. His grandfather was Maulvi Sakawat Ali Khan, an able and honest Deputy Collector who supervised the Permanent Settlement of many portions of Bihar. After learning Persian and a little Arabic at home and passing the vernacular primary examination with a stipend, Master Haq joined the Patna Collegiate School in 1876. According to a sketch of his life by Mr. Sachchidananda Sinha to which we are greatly indebted, he displayed even in his school days a passion for devouring "all kinds of light and serious literature, particularly books dealing with Islamic history in various countries." Matriculating in 1884 he entered Patna College, but two years later gave up his preparations for the University examination with a view to going to England. His guardians objected to the proposal, and he migrated to Canning College, Lucknow, in 1887 and displayed great activity in writing poetry and articles for the Urdu papers. After making a lengthy tour of the great towns of Upper India in the first quarter of 1888, he left India with only Rs. 70 in his pocket, reached Aden in a pilgrim ship and wired home for money to complete his voyage to England!

Reaching London on 15th September, 1888, Mr. Haq kept terms in Middle Temple, and "gained the title of *the book-worm* by his devotion to the study not only of law but of many other subjects, including some of the sciences." At London he started the Anjuman-i-Islamia (now the Pan-Islamic Society) and became an ardent Liberal in politics.

After being called to the Bar he returned to India in July 1891, and began practice at Bankipur. From 1892 to 1896 he served as a Munsiff in Oudh, but "his heart was pining for larger fields of activity. A love for his country and its political re-

generation were the chief determining factors of the next step in his life. He resigned his post in April 1896 and resumed his practice at the Chapra Bar." It was Mr. Haq who represented the constable Narsingh in the appeal before Mr. Pennell, after the poor man had been sentenced to imprisonment by a Deputy Magistrate (Maulvi Zakir Husain) in secret consultation with the District Magistrate, for the terrible offence of *receiving* a beating from a European officer (1899)!

In the great Tirhut Famine of 1897 Mr. Haq worked hard and travelled extensively as Honorary Secretary of the District Relief Fund, with the result that his health broke down and "for one year he was bed-ridden."

His next great public service was as Vice-chairman of the Chapra Municipality, when in the course of three years he cleared that Augean stable of corruption and mismanagement. Under his able and vigorous administration the accounts department was overhauled, and "the whole municipality became absolutely a different body, and a Municipal Market was built at a cost of Rs. 20,000. In 1907 he removed to Bankipur and gave a new life to its politics."

In December 1906, an all-India Muslim gathering was held at Dacca, to start a political association of the sect with the object of "supporting every measure emanating from Government and opposing all the demands of the Congress."

"The publication of this militant and aggressive circular at once made him decide to go to Dacca. He felt that it would be against the public interest for the Muhammadans to start an association with such objects. The two friends (Messrs. Mazhar-ul-Haq and Hassan Imam) succeeded in pushing into the background the proposed institution and in starting in its place the All-India Muslim League." (S. Sinha). He also opposed the capture of the League by the Aligarh party on the ground that it would either injure the College or the League would become an

official-ridden institution. Though he was outvoted, his prophecy has been verified, and the League is now at last working on his lines.

A harder trial was soon to come for Mr. Haq, but his sincere patriotism, transparent unselfishness and fearless courage of conviction made him defy threat and temptation alike and risk the hostility of the fellow-Muslims whom he loved so well and to work with whom was his highest aim. When Sir H. Risley spoiled Morley's Reform scheme by introducing religious differences in the political sphere, Mr. Haq and his friend Mr. Ali Imam, "strongly opposed the unreasonable demands of the Muslim League extremists for special electorates. They were attacked and abused by the vast bulk of the Musalman press in India. They were called traitors and renegades, but...contumely, ridicule and abuse did not at all affect their patriotism." (S. Sinha).

In Bihar, Mr. Haq organised the first Bihar Provincial Conference (1908) to which his name and that of its president Mr. Ali Imam drew all the Musalmans of light and leading in Bihar. The theoretical Liberalism which Mr. Haq imbibed when a law student in "the land of the free and the brave" he has applied to his own country. Throughout life he has been a staunch and avowed Congressman. He has been Vice-President of the Bihar Provincial Congress Committee and was the Chairman of the Reception Committee of the Indian National Congress which met at Bankipur in 1912.

As Member of the Supreme Legislative Council (1910-1912), Mr. Haq did not show himself a hasty or extreme reformer. He was ready to accept the theory that administrators might honestly look on things differently from the people. But in a year or so his eyes were opened by what he saw and heard and he knew what this theory really meant for the Indian people when translated into action. Then Mr. Haq, with the fearless courage and love of truth which has distinguished him through life, publicly avowed his mistakes and came into line with Gokhale

MR. MAZHAR-UL-HAQ,

President, All-India Moslem League, 1915.

and Bhupendra Nath Basu, the trio often sitting on the same bench in the Legislative Council to the disgust of those who had hoped to find in him a docile Khan Bahadur.

But Mr. Haq has paid the price of his conduct and we know he does not repine at the loss. As an open opponent of sectarian representation in the Legislature, he has been refused re-election by the Bihar Muhammadan electorate. But the mass of the community and the young educated generation idolise him as a leader. He raised an immense sum for the relief of Turkey during the Tripoli and Balkan Wars,—his fervid Urdu eloquence thrilling thousands at Calcutta and elsewhere and he defended the Cawnpore Mosque rioters.

GLEANINGS

Frogs with Hair.

In popular mythology "frog's hair" and "hen's teeth" have long played a part as typical rarities. But it has since been discovered that the German Kongo frogs have upon their bodies either hair or a very good imitation of it. Anatomically it is not hair, in the sense in which we apply that term to mammals. Our own hair is akin to our finger-nails; it is horny growth, whereas the "hair" on the African frogs is an abnormal development of the tubercles that appear on the skin of the ordinary frog.

A "HAIRY" FROG

From the German Kongo.

Dr. H. Gadow had made a microscopical examination of the hairlike structures, and reported that he was unable to find any nerves in them, altho he made out some insignificant blood-vessels and lymph spaces. He concluded that these appendages could not be considered a sensory apparatus, and that their function was a mystery.

But Willy Kuenthal, working in the Museum of

Comparative Zoology at Harvard College, established that the hairlike appendages were present only in the males, and altogether wanting in the females.

These appendages do not attain the same degree of development in all male individuals, and that even in full grown males there are very conspicuous differences in this regard.

The hairlike covering is most highly developed during the breeding season, it is to be considered a secondary sexual characteristic. The females have, on exactly the same parts of the body on which males bear these appendages, small but quite distinct tubercles, which have the same diameter as the bases of the appendages in the males. Their distribution over exactly the same areas of the surface shows clearly that they are homologous with the appendages of the male.

Both males and females show similar tubercles scattered over the whole back, and they are more closely crowded in the region of the angle of the jaws. In some areas of the surface of the males may even be observed the transition of these tubercles into hairs. These hairlike appendages are therefore to be considered as highly developed tubercles of the skin.

—*Literary Digest.*

Movies and the Eyes.

If your eyes are strong and normal, looking at moving pictures will do them no harm; if they are weak, you had better stay away. The elements likely to be the source of irritation to the delicate structures of the eyes are "flickering," or vibration, and inaccurate and variable focusing of the pictures, also the relation the light reflected from the screen bears to the visual plane of the observer. To a normal spectator the undue effort required to maintain distinct vision under these circumstances often produces discomfort, but this subsides and no permanent injury results. Where the refractive powers of the eye are defective—a condition more common than the normal one—eye-strain, with its accompanying disorders, will probably follow.

The influences of the motion-picture often work for the individual welfare, since, in many instances the existence of an optical defect is unknown until subjected to strain in viewing these projected images. The irritating features are possible of elimination by a more accurate mechanism regulating the relation between the condensing and projecting lenses, more care in the selection of the glass used and in the grinding of the lenses; and a scientific understanding of optical principles by those who are responsible for the placing and operating of the projecting machines. The most irritating feature to the eyes is the exposure to the direct reflected rays, and this condition should be remedied.

One very serious objection to the manner in which the pictures are projected upon the screen is the presence, in some of them, of innumerable glimmering, flashing, and dancing bright spots that try the eyes.

Another feature which puts a severe test upon the eyes is the unnatural swiftness with which the

HOW EYE-STRAIN AT THE MOVIES MAY BE LESSENED.

One of the chief causes of eye-strain in the motion-picture theater, according to Dr. J. Norman Risley, is the glare reflected from the screen. The top diagram shows the usual position of the projecting machine, which causes a reflection injurious to the eyes. In the middle diagram this fault is obviated, but the position of the machine is illegal. The third cut shows Dr. Risley's proposed solution—the picture projected from the basement instead of the gallery.

films are reeled off, making every action abnormally rapid and jerky.

But the common practise of flashing written letters and printed matter on and off the screen with almost lightning celerity puts the greatest strain of all upon the eyes.

Another effect of watching moving pictures, worth mentioning in this connection altho it is not injurious, to the eyes, is a pronounced hypnotic experience that many people have, particularly when the performance is prolonged to more than one or two hours and is not of a very exciting nature.

Skill in Handling Artificial Arms.

A young New Yorker is doing many remarkable things with the two artificial arms which for a number of years he has worn in place of those first given him by Nature. In fact, he goes through the paces of every-day life without the slightest fuss or effort, and

yet he has wood for flesh, steel for joints, and rawhide cords for muscles in place of the real fingers and wrists.

The arms are made of willow-fiber, with rawhide cords as muscles, each one attached to suspenders stretched across the back and chest, to give tension. Forward movement of the stump raises the elbow. A downward movement of the shoulder pulls the finger-cord, bending the hand backward from the wrist-joint and opening the fingers. Another shrug of the shoulder closes the fingers and locks them so that they can hold whatever object is being handled.

In the presence of the astonished surgeons at the International Surgical Congress in New York the other day the young man dressed himself. First he buttoned his shoes and put on his garters. Then he drew his

Skill in Hand Artificial Arms.

shirt over his head and buttoned it down the front, closing the top with the ordinary collar button. Then he picked up his collar and buttoned it back and front, handling it as deftly as the average man manages his with ten fingers. When this was done, he tied his four-in-hand scarf, drew it tight and fastened it snug with his scarf-pin, drew on his coat, picked up his hat and put it on. Next he rolled a cigaret, struck a match, lighted the 'smoke' and started puffing it with plain enjoyment. Walking over to the water-cooler he drew himself a drink and tossed it off without spilling a drop. And when he dashed off his name in excellent handwriting, first with the right hand and then with the left, he completed an exhibition which has not yet ceased to cause wonder among those who saw it.

The Technical World Magazine.

Holding Breath to Beat the Record.

In the course of some recent experiments in respiration in the University of California Medical School, an undergraduate student held his breath ten minutes.

This was accomplished while having the student lie on a table, with a pneumographic belt attached about his thorax and communicating with a kymograph. Slow, deep inspirations were taken for two minutes; this eliminated a good portion of the carbon dioxide from the blood. A breath of oxygen was then taken and the time-marker started. The tracing is here shown. A slight relaxation of the respiratory

TRACING OF A RECORD BEATING RESPIRATION EXPERIMENT

muscles is indicated at two minutes. No desire to breathe was experienced until six minutes had elapsed. The belt having been placed over the diaphragm, the pulse-rhythm is shown throughout. From this time on, the conscious effort to hold the breath increased and an involuntary twitching of the abdominal muscles was quite apparent; but no respiration took place. All the time the pulse was full and strong, the color good. No oxygen want appeared. At the expiration of ten minutes some vertigo occurred, and

the impulse to breathe having become imperative the first inspiration was taken—ten minutes and ten seconds having elapsed. No great hyperpnœa, no weakness, no heart changes appeared. The student rose from the table and went about his class-work. Mr. Horner, on whom this experiment was tried, is a swimmer and has participated in underwater contests.

INDIAN PERIODICALS

The Teaching of Civics in Schools

is the title of an excellent article in the *Local Self-Government Gazette* which sets forth within a short compass sane directions for the teachers and pupils for growing up into useful and intelligent citizens.

We read

In teaching civics the aim should be to train for citizenship. Good citizenship depends not so much on a knowledge of the governmental forms of a community as upon the practice of civic virtue in that community. The pupil should know what community life means. He should have the desire to be an honest, industrious and useful member of the community, because he has been taught to feel that his happiness and the welfare of the community depend on his efforts to live right.

The school affords the teacher an excellent opportunity to illustrate concretely the principles underlying community life.

The pupil should be taught that a citizen's rights are the most important things he can possess, that the government exists for the protection of his rights, and that the form of government depends upon the recognition and protection of his rights. But he should be constantly and persistently reminded that every right has a corresponding duty. The rights of some citizens are the duties of other citizens. Rights and duties go hand in hand.

The ethical organization of a school is of greater importance than ethical teaching. School government and class management are living and concrete examples of government, ever before the eyes of the

pupil, therefore every act and every order on the part of adults in the schoolhouse should be carefully considered with a view of the effect on the pupils. One cannot expect obedience if one himself is not obedient; one cannot expect respect if one is not respectful himself; one cannot expect fairness if one is not fair-minded himself; one cannot expect pupils to practise civic virtues when the same are being violated by his elders.

Here is a bit of sound advice for the teacher:

The teacher should be impressed with the belief that every action of his own is influencing the character of his pupils; otherwise he is not training them. In order that pupils may have actual experience in governing themselves, they should be released from constant guardianship, they should be given some responsibility and some opportunity for self-government by allowing them to manage or take an active part in managing the discipline of the school, the recitation, their own clubs, games, playgrounds, fire drills, opening exercises, entertainments, excursions, class and school libraries, athletic contests or class savings banks.

Pupils should be made to feel their responsibilities by being made responsible for something in the preservation of school property, in the tidiness of school premises and school rooms, and of the streets of the neighbourhood, and thereby learn that mutual assistance and co-operative service are the fundamental principles of all healthy self-government.

Pupils should be led to see that without law, liberty itself is impossible; that infractions of the law are injurious to the people individually and collectively.

ly, and that it is the duty of each citizen, young or old, to aid in the enforcement of the law.

Dr. N. Macnicol has translated, as an experiment, so he says, some of the

Devotional Lyrics of Tukaram

which have appeared in the pages of the *Young Men of India* for December. Mr. Macnicol has not been unsuccessful in his attempt, and those people who are not familiar with Marathi have here an opportunity of becoming familiar with some of the writings of Tukaram. For the benefit of our readers we quote some of the translations together with a short introductory note on Tukaram.

Tukaram is the most popular of all the Marathi poets. He was born at Dehu, near Poona, early in the seventeenth century, and his voluminous poems are very largely occupied with the worship and the praise of the god Vithoba of Pandharpur. The intensity of his desire for fellowship with God gives him a place among the devotional mystics of the world—those men and women who can say, "Take as the hart panteth after the water brooks, so panteth my soul after thee, O God." His poems, which are called *abhangs*, are mostly short devotional lyrics of from eight to twenty lines, and many of them are familiar to the simplest peasants all over the Maratha country.

THE SOUL'S YEARNING FOR GOD.

- As the bride looks back to her mother's house,
And goes, but with dragging feet ;
Even so it is with my soul, O God,
That thou and I may meet.

As a child cries out and is sore distressed,
When its mother it cannot see,
As a fish that is taken from out the wave,
So 'tis, says Tuka, with me.

A CRY FOR GOD'S LOVE.

A beggar at thy door,
Pleading I stand,
Give me an alms, O God,
Love from thy loving hand.

Spare me the barren task,
To come, and come for nought—
A gift poor Tuka craves,
Unmerited, unbought.

THE BOLDNESS OF FAITH.

Launch upon the sea of life ;
Fear not aught that thou mayst meet.
Stout the ship of Pandurang ;
Not a wave shall wet thy feet.

Many a saint awaits thee there,
Standing on the further shore ;
Haste says Tuka, haste away,
Follow those who've gone before

HE KNOWS OUR NEEDS.

Unwearied He bears up the universe ;
How light a burden is !
Does not His care the frog within the stone
With food supply ?

The bird, the creeping thing, lays up no store ;
This great One knows their need.
And if I, Tuka, cast on Him my load,
Will not His mercy heed ?

THE SECRET OF PEACE.

Calm is life's crown ; all other joy beside
Is only pain.
Hold thou it fast, thou shalt, whate'er betide,
The further shore attain.

When passions rage and we are wrung with woe
And sore distress,
Comes calm, and then—yea, Tuka knows it—lo !
The fever vanishes

Transition period in our Life

is the title of a readable article in the *Crucible* for September-October, penned by S. V. Puntambekar.

The writer holds that

The whole life of a society is a transition period. But some epochs of its life present sudden transitions which follow contact, conflict and revolution. At present the inherent forces of our society have been weak and yielding under the influence of external forces which are strong and resistless.

The effect of isolation :

History tells us that isolation from external centres of thought and civilisation, though sometimes it may prove a blessing in the form of having an individual type of national character and civilisation, has often proved a curse. Exhaustion of national greatness after a period of splendour and achievement is very common in past history, if the people in question are completely isolated from external world-forces

The writer goes on to say :

Our isolation of hundreds of years received a rude military shock from the advent of Mahomedans first and Europeans afterwards. In fact two civilisations one Mahomedan and the other European, one after another, during the last thousand years have been trying their best to darken and enlighten our thoughts, to confuse and inspire our minds. In both the cases their main superiority lay in military organisation, enterprise, co-operation, diplomacy and cunning, physical valour and intrepidity.

Mr. Puntambekar does not believe that Mahomedans in India have done us much good whether in the capacity of conquerors or fellow citizens. Neither does he believe in the individuality or greatness of Mahomedan art in India. Says he :

Then thundering shock of arms and their youthful energy did stagger us in the beginning. Their military qualities, those of daring and onslaught, were an object of wonder to our inactive minds. But we soon realised their intellectual inferiority, and condemned their brutal force as a piece of savagery

Mahomedan art in India is not purely Mahomedan but possesses a strong element of Hindu artistic genius; and that this so called Mahomedan contribution to India does not in any way compensate for the ruin and stagnation of our independent development,

and for the downward direction of our thoughts. The only credit I am inclined to give them is that when India was splitting into independent fragments, when petty jealousies were fomenting internal troubles, and when practically stability of life, foresight and the true star of India's self-interest had disappeared, their military valour kept alive in the minds of the downtrodden Hindus, that they were a part and parcel of a great country and civilisation and never allowed the fundamental unity of India to be dissolved.

Let it not be understood, the writer takes care to inform us, that he is drawing up an indictment against the whole Islamic civilisation. His remarks concern only what the Mahomedans brought into India. "Their civilisation and culture have left us a legacy that we may be proud of them; and has long ago exhausted itself to influence us in any way."

"The second and existing foreign force and influence is the European." In the struggle of the white people for attaining supremacy in India "the more practical, the more compromising, the better organised genius of the English succeeded," and quite sensibly, "they did not follow long the wrong track of despotism and obstinacy." As a result, "the last fifty years provide us with evidence that some progress in co-operation with the people and in their welfare has been made."

There is much truth in what the writer presents in the following lines.

In our ordinary walks of life we are observing European manners and custom, food and fashions, and more or less imitating them to a certain extent. But in all these cases we have not succeeded in differentiating trivial from important. We have not even realised our surrounding circumstances. We read European literature but do not attempt to study it. We enjoy the advantages of the advance in science, but do not fathom its depth and realise its truth. History entertains and dazzles us but we do not improve by the light it affords, and the experience it bestows. Our attitude is that of a wondering child, not that of a cool critic or experienced manhood. To read European philosophy gives us pleasure, but we neither see its truth nor expose its falsehoods. We become sceptical but are not convinced. Our scepticism is born of superficiality of our knowledge. We have not analysed or compared its contents or its basic principles. The same is the case with regard to our ways of life. The variety of manners, of customs, of food and dress which we are always changing, not in the light of higher principles of society, morals, and religious beliefs, but out of sheer imitation and false notions, shows the instability of our minds. Uniformity in life may be a monotony, but vagueness is certainly a danger. Conservation may not be advisable, but looseness is an enemy.

The writer holds that in our present-day society

There have been no bold suggestions, no heroic breaking up of circumscribed limits, or suitable recon-

structions of the old with the new. There seems to be a chaos, a curiosity and a confusion, there is no real desire, no perseverance, no studied foresight. It is all in a muddle everywhere. Some sparks of real knowledge do enlighten us, but they disappear without having completed their task of lighting an everlasting torch for spreading the empire of knowledge.

The Apalling Poverty of India

B. Raman Menon contributes to the *Wealth of India* for November a telling article in which is described the tragic conditions under which the average Indian lives.

The article opens with the following lines :

India is rich in natural resources and commands an almost unlimited supply of labour; yet the annual collective income of the nation is deplorably small. This is sufficient proof of the alarming inefficiency of Indian labour. Almost all employers of labour in India have had reason to complain of the incapacity of the average Indian labourer for sustained exertion.

What is the root cause of this want of efficiency? Lack of physical vigour is the general cause. And what is it due to—this lack of physical vigor?

Among the many causes to which this lack of vigour can be attributed, by far the most important is the systematic and all but universal under feeding that prevails among the masses of the Indian people. "It is", says R. C. Dutt "literally a fact and not a figure of speech that agricultural labourers and their families in India generally suffer from insufficient food from year's end to year's end. They are brought up from childhood on less nourishment than is required even in the tropics and grow up to be a nation weak in physique, stunted in growth, early victims to disease, plague or famine." This has been the opinion not only of Indian publicists, who may be supposed to take a jaundiced view of the situation, but also of responsible Government officials as the following extracts will show :

"The united earnings of a man, his wife and two children cannot be put at more than Rs. 3 a month. When prices of food grains are low or moderate, work regular, and the health of the household good, this income will enable the family to have one fairly good meal a day, to keep a thatched roof over their heads, to buy cheap clothing and occasionally a thin blanket." (Report from the Collector of Etawa.)

"The pooriness of their physique demonstrates that they are habitually half starved. (Collector of Banda)

"It is not till a man has gone into these subjects in detail that he can fully appreciate how terribly thin the line is which divides large masses of people from absolute nakedness and starvation." (Commissioner of Fyzabad)

"Hunger is very much a matter of habit and people who have felt the pinch of famine—as nearly all the poorer households must have felt it—get into the way of eating less than wealthy families." (Deputy Commissioner of Rai Bareilly.)

"The diet is of a distinctly inferior class, even

judged by the low standard of the country." (A report from the Delhi Division.)

"The standard of living is perilously low; herbs and berries are consumed for want of better food." (Gurgaon District.)—R. C. Dutt, *India in the Victorian Era*.

"A vast majority of the ryots lead a life of poverty and must at all times be but little removed from a state of short commons." (Kurnool).—S. R. Iyengar, *Forty Years' Progress of the Madras Presidency*.

This state of things will not come as a surprise to anyone who remembers the average annual income of the Indian. According to Lord Cromer, and Sir David Barbour, it is 27 rupees. Lord Curzon very optimistically placed it at Rs. 30. Probably the correct figures, if they could be obtained, will be much lower. But even if these figures were correct, they necessarily lead us to the conclusion that the average Indian is underfed.

The writer goes on to say :

Another recognised factor which makes for physical vigour and which is always associated with the problem of food is sufficient and healthy house-room. According to the last census the population of Madras Presidency is 41,870,160 and the number of houses is 7,916,490. Therefore on an average one house is occupied by five or six persons. This number is not unsatisfactory, but we can learn nothing from the mere number of houses—we should know what sort of houses these are. Evidence about this point is furnished in the humorous Census Report, of Mr. Molony. He says, "On the census night I sought perplexedly the house of one Mumyan in a city *paracheri*. A friendly neighbour banged against a sheet of iron which bent against the side wall of a cabin, and forth on all fours came Mumyan. His bar was certainly his residence, but it is a nice point whether it could be considered a house." Of the 7,916,490 houses in the Madras Presidency, we are afraid, a fairly large percentage will be found to be habitations, differing in no essential respects from Mumyan's.

Refuge

Under the above heading the *Arya* for November prints a few translations from the Tamil verses of Kulasekhara Alwar, the Chera King and saint. We reproduce four of them which will show that they are not without poetical worth.

Let Fire himself assail with its heat the lotus-flower, it will blossom to none but the Sun. Even if thou shouldst refrain from healing its pain, my heart can be melted by nothing else as by thy unlimited beauty.

The Rain may forget the fields, but the fields will ever be thirsting for its coming. O Lord of the city of the wise, what care I whether thou heal my wound or no, my heart shall ever be thine.

The rivers course down through many lands but must yield themselves to the Sea, they cannot flow back. O sea-hued Lord of the city of the wise, even so must I ever be drawn to thy resplendent glory.

Illusory Power ever seeks him who seeketh thee not, not seeking thy lasting Might. O Lord of the city of the wise whose discus flashes like the lightning, I must ever seek thee, who art thy servant.

The Thirty First Issue of the volume

Prices and Wages in India

is noticed in the pages of the October issue of the *Mysore Economic Journal*.

Regarding the rise of prices between 1890 and 1912 and its causes, we read :

In 1912 the general average of wholesale prices in India was 41 per cent higher than in the quinquennial period 1890-94. This very marked upward tendency in the prices of Indian products continued in 1913. To some extent it was due to seasonal conditions, for 1913 was not a good year from an agricultural point of view. Whilst on the one hand there were floods in parts of Bengal, Bihar, Orissa and Madras, on the other hand the monsoon ceased early in the United Provinces, Central India and Rajputana which also failed to get good winter rains. Famine conditions were therefore establishing themselves over part of the United Provinces as the year closed, and though actual 'famine' was confined to a comparatively small tract the outturn of crops was seriously affected over a much larger area. In consequence, therefore, the outturn of sugar, an important crop in the United Provinces, was seriously affected, and the excessive rainfall in Bengal in July and August resulted in the curtailment of the jute crop. Cotton was the only crop that fared really well.

The average rise in the wholesale prices of the 24 articles for which detailed statistics are given—the most important food grains, other food stuffs and tobacco, oil seeds, fibres and live stock—was two per cent over that of 1912. The average rise for all India in the prices of food grains was, however, considerably more than this and amounted to five per cent. The highest rise in food grains was in Arhar dal (fourteen per cent) and the lowest in Ragi (one per cent). On the other hand Bajra, known in South India as Kambu, showed a decrease of eight per cent, and Jawar, our South Indian Chulam, no fluctuation. There was no fluctuation in the price of sesamum, cotton and cotton seed but an increase in the prices of mustard and rape seed, poppy seed, ghee, jute, tobacco leaf and plough bullocks and a decrease in that of linseed, raw sugar (gur), refined sugar, turmeric and sheep.

"Regarding wages in 1913 the information is somewhat fragmentary."

The only information available was that supplied by the leading industries—cotton in Bombay, wool in the United Provinces, jute, paper and mining in Bengal, rice in Rangoon and brewing in the Punjab—and from the tea gardens. The importance of these industries is however shown by the fact that at the census of 1911, 704,000 persons were returned as employed in tea gardens, 308,000 as employed in cotton mills, 222,000 in other textile industries and 143,000 in collieries. The general result is to show a rise of three per cent in these industries in January 1914 as compared with January 1913. The greatest increase, one of nine per cent, was shown by the cotton and woollen industries followed by one of eight per cent in the comparatively unimportant brewing industry. The jute industry showed a rise of two per cent whilst the paper industry showed no change and the coal and the milling industries a fall of three and four per cent respectively. There was no material change in the case of tea gardens.

Prof. S. Krishnaswami Aiyangar contributes to the *Educational Review* for November an article entitled

Research in Indian History

At the very outset the writer quotes Lord Morley's idea as to what is history and what the historian should be like.

History, in the great conception of it, has often been compared to a mountain chain seen far off in a clear sky, where the peaks seem linked towards one another towards the higher crest of the group. An ingenious and learned writer the other day amplified this famous image, by speaking of a set of volcanic islands heaving themselves out of the sea, at such angles and distances that only to the eye of a bird, and not to a sailor cruising among them, would they appear as the heights of one and the same submerged range. The sailor is the politician. The historian, without prejudice to monographic exploration in intervening valleys and ascending slopes, will covet the vision of the bird.

"It is notorious," says the writer, "that India has but little history of her own."

The difficulties that have to be overcome in any work of research in this field are many and require talents of the highest order over a wide field of study. Broadly speaking the sources of Indian History can be grouped into three broad classes, namely :

1. Indian Literature (Traditionary and Historical);
2. Foreign Literature, chiefly the works of travellers, &c. ;
3. Archaeology, Monumental, Numismatic and Epigraphic.

The writer takes up each of these classes and considers them separately. The various records he mentions

have made it possible to compile a political history of India from the first century B.C. onwards with sufficient fullness up to the fourth century A.D. and with greater fullness afterwards. But to make the best use of these records and get them to yield all the results they are capable of yielding work in this line will have to go hand in hand with work in other departments of research in which hardly a beginning has been made, beyond a preliminary treatment, in detached writings, of details which will have to be hereafter brought together and handled on broader lines in connected and more easily accessible works.

The writer goes on to say :

Along with this work has to go on work upon the collation of all historical material available in literature, numismatics, art works, &c., and unless all of these are examined carefully and the material that can be drawn from them made available in a form accessible to students of history, no historical work proper would be possible. This will involve great labour in the literatures of four or five languages, in thousands of inscriptions in all these languages, besides the monuments, coins and works of art generally.

It is a hopeful sign of the times that these last are coming in for their share of attention at the hands of some individuals and Governments, and what is more they are coming to be studied with more of that sym-

pathy which hitherto was notoriously wanting. In the words of Justice Woodroffe : "It has been the fashion amongst European art-critics to deery the merits of Brahmanical sculpture on the ground of the alleged monstrosities of the Hindu *pauranic* conceptions, which, it has been said, are incapable of artistic treatment. The examples collected in this volume will, it is hoped, help to dispel such misconceptions and to refute the unjust criticisms which they have engendered, and will further a juster appreciation of the fact that Indian Sculpture is not a freak of Asiatic barbarism but is a worthy representative of a school of æsthetic performance as logical, articulate and highly developed as those of any country in Europe, ancient or modern."

Tourists in Japan

is the title of a short but informing article penned by Mr. C. Ramalinga Reddy and appearing in the November issue of the *Mysore Economic Journal*.

Mr. Reddy writes:

Japan knows how to mint her natural beauties into coin. Scenic attractions are by no means a negligible item in the national revenue of Japan.

From our personal experiences of Japan we know this to be perfectly true.

Japan attracts a large number of foreign tourists every year. Japanese hotels and restaurants, silk and curio stores, Railway companies etc., reap a rich harvest every spring and autumn which are the usual tourist seasons.

What is it that attracts tourists there ?

She has a wonderfully fine climate, midsummer being the only disagreeable season. Even the winter is quite enjoyable—the air is light and clear and there is plenty of sunshine and the thermometer does not go down very low or stay there very long. After it has snowed once or twice the hills and valleys look perfectly beautiful. In addition to natural scenery Japan offers all the attractions of art and antiquity. The temples of Nara, the shrines at Nikko and other celebrated places are in their way as interesting as the art treasures of Rome or Florence. The Japanese knew how to lay out parks and train trees long before the Western nations awoke to the conception of beauty in nature or landscape gardening. In architecture the Japanese are far inferior to us, but in all the other departments of art, decoration, painting, carving, sculpture, metalwork—and shall I add cleanliness and tidiness?—they are easily and by long odds our superiors. In the culture of flowers they are unsurpassed by any people in the world. And so the temple and surroundings display to perfection the combined charms of art and nature. The lotus ponds, the miniature bridges and waterfalls, the little artificial islands, the well placed rocks with a few pines growing out of them, and the other features of the regular Japanese garden reproduce on a small scale the beauties of mountain scenery. There is nothing grand or sublime about it, but it fascinates by its astonishing cleverness, and its pretty, coaxing, appearance. The places are kept very clean and spruce; the Japanese horror for dirty, slovenly ways.

But all these beauties would not have proved such a success in attracting tourists, foreign and Japanese, were life in Japan not based on better and more liberal principles than it is amongst the Hindus.

Anybody irrespective of caste, creed or colour could enter their temples provided only he takes off his shoes or else wears wooden or canvas over shoes, so that he may not carry into the sacred presence, along with his devotion, the dirt and dust of the street. There is nothing superstitious about this regulation; it is rational and therefore allows freedom of means if only the end is conserved. Thus the rule applies only to temples which are covered with mats and Japanese mats are very pretty and fairly expensive. In regard to many of the popular Shinto shrines, the floors of which are quite bare, people could go in with their shoes on. Even where shoes are prohibited, it is done not because there is objection to leather as such but on hygienic grounds. In many such temples and monasteries visitors are provided with over-shoes which they could slip over their boots and walk in. As a precautionary measure, I went about with a pair of over shoes of my own stocked in my overcoat pocket. But since the removal of shoes is considered by the Japanese, as amongst us, a mark of respect, it is insisted on in the case of a few very holy places—such as the Shogun's shrine at Nikko, the temple of the Sun-goddess at Ise, and the Imperial places (for the Emperor is divine). Here both boots and overcoats should be taken off but socks are kept on and visitors are provided with felt or other warm slippers. So on the whole even in regard to matters of this kind, which are better tests of a people's temper than things of more ostentatious importance, the Japanese are a remarkably reasonable race.

For the convenience of pilgrims and tourists there are large numbers of inns and rest-houses near temples, health resorts or any other places of interest.

Owing to the absence of caste or other forms of antisociality, hotels have sprung up in great abundance. Foreigners, as a rule, prefer to go to hotels in which the comforts they are used to are provided. These are known as foreign hotels, though most of them are owned and managed by Japanese. Sometimes out of curiosity they stop at Japanese inns, which however defectively furnished and provided from their point of view, are invariably clean and attractive. They may not like the food which consists chiefly of rice, fish, and vegetables, cooked in a manner which does not appeal to their taste, or the necessity of having to sleep on quilts spread on the floor-mats, but then the rooms are large and prettily decorated with kakemonos and embroideries, the quilts too are done in fine rich designs, the surroundings are perfectly clean and tidy, and the host, hostess, and maids excel in good manners and polite attention.

The Japanese know the art of alluring customers.

They advertise well the scenic attractions of their country. At every railway station is put up in conspicuous position a board containing a list of the places of interest near by, and their distance from the station. Maple parks, plum groves, cherry valleys, waterfalls, pine woods, mountain peaks, Buddhist and Shinto shrines, castles, or whatever else there is of beauty or antiquarian interest within six or seven miles of that spot are included in the list.

India too could enrich herself by drawing tourists from abroad if she were as liberal as Japan; if she offered the same facilities for travel and stay in places noted for their scenic beauty or of historical interest; if she were more tidy and less indifferent—in fine if she were more up-to-date and well-organised.

As India is to-day, she does not offer enough attractions to the foreigner to empty his purse here.

The cry for

Home Rule in India

has been started. As time goes on it will gain in volume and strength. In the course of an article in the *Commonweal* "Politician" says that "the Mysore Representative Assembly may be said to be an object-lesson in Home Rule in India."

The Mysore Assembly was started by the late Mr Rangacharlu, the first Dewan of the post-Rendition period. He was a man imbued with the best principles of the British administration in India, and his work, whether in Madras or Mysore, has shown what an Indian trained under high class British officers of the old type could achieve, if given some latitude in a Feudatory State. His conception of a large Assembly composed of the governed was considered as a novel one at the time. Its annual sittings spread over six to seven days and its discussions of subjects brought forward are brief, pointed and constructive in character. The time allowed for a speaker is very limited and if he shows any tendency to be diffuse, he is soon made to know it. Though largely made up of people without any knowledge of English, the members respect the rulings of the chair, come well prepared with facts and figures, and even with precedents, and show a distinct desire to get through the business in hand without delay. Its utility as an annual audit of the State's progress is recognised by His Highness's Government as is manifest from the privileges conferred on it from time to time. This year Sir M. Visvesvaraya intimated that Government had bestowed on it the right to ask twenty-five supplemental questions after the arrival of the delegates in Mysore and a majority agree in the view that they should be brought forward. They have also conferred on them the right to criticise the State Budget, a privilege which was utilised in a telling manner by a few of the members present this year.

Anybody could see the highly fertile character of the debates if he considers the concluding speech of the President of the Assembly which closed its thirty-second session a short while ago.

He promised, for instance, a fresh Committee of Inquiry in regard to the question of the relations between landlords and tenants. The Report of the first Committee is vitiated to some extent by the fact that the Committee had no representative of the tenant class on it. Its Report cannot, under such

circumstances, be taken as final, more especially as we know, from experience, that landlords of every class have no great desire to further the interests of tenants. These facts were brought home to the Government by different speakers and the effect was magical. The same may be said in regard to the sympathetic promise made by Sir M. Visvesvaraya as to the need for reducing the irrigable area under tanks which have been silting for ages. While the silting up process has been going on steadily though imperceptibly, the area under irrigation has remained the same, with the result that wet rates are charged where the supply of water is either deficient or practically nil. This is a grievous injury that ryots suffer from in British territories as well, but a remedy here has been made possible by popular representation.

Mysore has solved the question of the Separation of Executive from Judicial functions, but want of funds stands in the way of the adoption of the approved scheme. It may be argued that while there may be little to be said against a reform of this kind, the financial objection to its wholesale adoption may practically prove an insuperable one even in a comparatively small State. "No," said the popular representatives in effect; if an abuse is an abuse, it must be remedied and a remedy should be found for it. Sir M. Visvesvaraya's answer in regard to free primary education seems a just one, in the light of the popular demand for it, though it may smack a little of Mr. Lloyd George's maxim of exploiting the rich for the benefit of the poor.

The lively discussion in regard to the imposition of a cess in lieu of compulsory personal labour in connection with communal work for half a day in the week led naturally to a reply which is not likely to prove a final one on the subject. The report of this discussion published in the papers will doubtless have made it clear that the villagers themselves are conscious that however much they may feel for it, communal life on the old lines is fast passing away. The causes which have contributed to this result are many; but the position though clear is not free from difficulty. Sir M. Visvesvaraya's answer to the members is, we think, therefore a right one. More time is necessary for the formation of a more decided opinion in the matter. If practical unanimity prevails among the people themselves in regard to it Government action would be open to less objection. As it is, the imposition of a cess of the kind proposed would be hardly legal. Perhaps legislation of a simple kind may easily help Government to get over this technical difficulty but before Government could undertake this, it would be necessary for them to obtain a clearly defined opinion from the people primarily affected by it.

The throwing open of the State Life Assurance

scheme announced by Sir M. Visvesvaraya is another concession which popular representation has won for the people. It is we think fully justified by local conditions, though we trust that steps will be taken to differentiate this class of insurance from that covering the case of public officials. Still another question discussed related to a railway connection to a port on the West Coast. It is still said to be under "active investigation." This question owes its prominence as much to the people's representatives in the Assembly as to the planters.

"Politicus" closes his article with the following very pertinent observations:

The subjects touched upon at the last session of the Mysore Assembly show that the people's representatives, though most of them are ignorant of English and speak only in Kanarese, are quite up to the mark. It is a mistake to think that Indians when trained to look at things from the business point of view would not prove successful in the handling of public questions. It would be verily a libel to say so. Trust begets trust; believe the people, and you will not be disappointed. Opportunities make men; they create politicians, even statesmen. Blame not people without giving them an opportunity to prove their capacity. The only way to learn is to try and do a thing straight out; failure need not be made much of in the first instance. Unless judges commit mistakes there is no progress in legal procedure or substantive law. That is so everywhere. Unless we commit mistakes, we can never learn. Because Indians commit mistakes, it should not be said that they are unfit to exercise power. That would be arguing against common experience. It is said that, thirty years ago, members of the Mysore Assembly did not know what questions to ask. Dewan Rangacharlu, it is said, took them by the hand, and taught them how to prepare their questionnaire. When he disallowed questions, he showed the questioners concerned why he disallowed them. In course of time the members have become experts in their work, have developed a sense of solidarity that is surprising. They do their work efficiently and well. Their position as popular representatives is coveted, and their work is so much appreciated that they are believed to be the best spokesmen of popular grievances.

Government in Mysore is largely moulded by opinion as expressed and formulated in the Assembly. That is one reason why Government in Mysore is hardly ever unpopular, though there is, to speak frankly, no free press in it as yet. The Assembly is the organ of the people, and it is the one factor that has to be reckoned with by the Government as a whole, and by the official in his individual capacity.

FOREIGN PERIODICALS

Under the heading

An Enquiry into Vulgarity

there appears an article in the *New Statesman* in which the writer deplotes the lack of dignity and want of good taste which are evidenced in some of the posters issued

by the British Government to draw recruits for the present struggle.

The writer is not wrong when he says, "that which is wit in an ordinary citizen is blazing vulgarity when uttered by a Government."

JEFFREY ALLEN RA

The voice of Johnnie Jones or George Robey is one thing; the voice of England is another; and it is the voice of England, and not of Johnnie Jones, which will have the profoundest appeal for Englishmen in a time of peril like the present. "It is more blessed to go than to be pushed"—that is the Johnnie Jones note and would pass in a music hall. The England for which men lay down their lives, however, is not a music hall comedian. She is, however vaguely, a sacred land, a place—almost a person—beloved. It may be retorted that, if this were so, soldiers on the march would sing sentimental hymns to England instead of music-hall songs. But that would be to misunderstand. Soldiers sing music hall songs not as an expression of all they believe and care for, but as a sort of careless music of courage. They sing them among themselves, but even they do not expect generals and statesmen to address them through the medium of music hall songs. No one would have been more shocked than they if the Prime Minister, in the course of his visit to the Front, instead of addressing them in the grave language of patriotism, had insisted on singing them *The Night I Found the Five Pound Note*; and the general who on the eve of battle attempted to rouse the courage of his men by singing *The Hat My Father Wore* or some other light song, excellent in its own place, would be regarded as a lunatic.

The writer goes on to say: . . .

Men live largely by forms: at least they desire forms which suit the spirit of different occasions. Their passion for decorum is as great as their passion for indecorum. They claim the right to be both familiar and vulgar themselves; but they have no love for excessive familiarity and vulgarity in those whom they wish to respect. They resent the thought that the latter may be simply superior persons trying to play down to them. Mr. Lloyd George, familiar though his genius is, would only horrify his followers if he winked on the platform, sang out "Cheero!" to his interrupters, and behaved like a comedian at a third rate smoking concert. Yet that is more or less how the British Government has been behaving in its recruiting posters. It has been made to appear familiar and by all means vulgar. Some of the recruiting bills of the Napoleonic wars used to end with the sentence: "God damn, blast, and confound the enemy!" On the whole, we are glad this sentiment has not got on to the hoardings during the present war. But we are not sure that we do not prefer it in some ways to "Is your best boy in khaki?"

Recruiting is not a thing which is to be "pushed in the same manner as pills or soap."

That in itself is a vulgar conception of the call of what most of us regard as a war of liberation. Garibaldi did not summon his conquering volunteers to his banner with jests about its being better to go than to be pushed; he offered them death and wounds on behalf of their country, and they rose to the appeal like heroes. Joan of Arc did not go about France asking young girls questions like "Is your best boy in khaki?" She spoke in the accents of one inspired, and men died at her bidding.

But what is vulgarity?

There is nothing more difficult to define than vulgarity. It is often merely something one dislikes in somebody else's manner of speech or behaviour. . . . Vulgarity is apparently something which may

afflict kings as well as the common people. It is something which is as rife in the middle classes as in the working classes—perhaps more so. . . . It is the spirit of insensitiveness, of ignorant egotism, of indifference to the code of civilized people, of indignity. It flaunts gewgaws in scorn of mind. It cheapens fine emotions. It talks loudly, it walks loudly, it brings itself loudly. It restores man to an ape.

Unity Beneath the Present Discord

is the title of a lengthy and profoundly thoughtful article penned by Eugene Troubetzkoy and published in the *Hibbert Journal*.

Underlying the present discord and inharmony which is convulsing the whole of Europe and countries situated far away from Europe, there is an unity, an underlying solidarity which is almost a miracle. This unity is visible in the fighting nations taken individually or all together.

It is only in times of national danger that the feeling of national unity can attain this degree of penetration and vigor. Now, therefore, is a very moment when, in spite of the fury of the strife between the nations, we become aware, with a depth of feeling unknown at other times, of the general meaning of our life. This stands out in clear relief, infinitely raised above the nations and their quarrels, and forms an indefeatable bond of union, which should be capable of reuniting them and triumphing over their discords.

In war we always witness the growth of the consciousness of national unity. It thus exaltation of national sentiment is exceptionally strong at the present moment, it is because the world war is without any parallel in history: men are not fighting for the minor interests of life. For all the combatants engaged it is the very nation that is at stake.

At the beginning of the present war a mighty revolution was effected in the minds of men. Suddenly the strife of parties was seen to stop; no more disintegration, no more discord: in every country the union of the nation was re-established and affirmed. These were the typical facts equally conspicuous in each of the opposing camps. Lost in time of peace, the guiding motive of life asserts itself unmistakably in time of war: each nation comes to itself and gathers its forces to a unity under a single idea and a single act of will.

The effect of war is thus described by the learned writer:

The great European war has brought a wonderful increase to the intensity of life both in the individual and in humanity at large. The chief result of the war has been to double the energy and active force of the general life.

On the one hand war unchains the powers of hell; it breaks the fetters which civilization has fixed upon evil, but, on the other hand, it is during war that all the forces of the good, hidden in the depths of the human heart, rise up and gather themselves together to do battle against the Satan who has broken loose. In these supreme moments we see the awakening and uprising of moral forces which till then have slept; new qualities, or, it may be, the

long forgotten traits of past ages, make their appearance. Suddenly comes the perception that all our European culture is only a thin covering hiding the ferocious appetites of man's bestial nature. We behold the savage in man, the antediluvian monster, which remains the same in its essential nature, slightly polished and drilled by civilization, but also armed by civilization to the teeth. Once more we must listen to the story of the achievements of the brute, of the superhuman cruelty of individuals and of masses—all the horrors of prehistoric chaos making a fresh appearance in the twentieth century. But at the same time we see the revival of beneficent forces which, until that moment, have been dormant, or demoralized by the comfort and well-being of our daily life in the long interval of peace.

This abnormal force of hatred, now let loose, provokes and quickens into activity an equally abnormal force of love, so that, for the time being, the most astonishing heroism is looked upon as an almost everyday occurrence, and the supreme act of self-surrender becomes an ordinary event. Most remarkable of all is the fact that this sublime heroism has ceased to be the exceptional quality of a few individuals—the heroic spirit possesses whole masses of men.

At such a time a new type of humanity comes into being, more powerful and more wonderful to behold. Man augments his stature; and therewith the feeling of his own value gathers force within him.

The part love is playing in this war is thus described :

Love is reacting against the hatred which is invading the world; and for that reason it burns in all its forms with a splendor and force such as we see at no other time. This ardent flame of love we may now behold in a vast variety of situations.

In all such scenes the most moving figure is that of the woman, standing beside the husband, son, or brother who is going off to the war.

At the beginning of the war the Russian papers published a letter which had been intercepted by our troops, written by a young German girl to her lover in the Army: "What does this cruel Kaiser want with our poor bit of happiness, which is so dear to us?" Every loving heart, especially if it is a woman's, has the same feeling in similar circumstances. And yet in this woman's love there is an aspiration of a higher order, which imposes silence on the spirit of rebellion. The letter which I have just quoted contains also this phrase: "Return covered with glory; be my victorious Siegfried."

The psychology of love: the love of the individual, the love of country.

In all true and sincere love there is this inevitable conflict of two powerful aspirations: first, the desire for the preservation of the being beloved, the desire to snatch him from death at all costs; and then, along with this, the dream of seeing his brow encircled by a crown which cannot be won save by an act of heroism, often at the cost of his life.

Love is not satisfied by merely perceiving the presence of the being beloved: it must also reverence him; its object must justify its devotion. And love is deeply conscious that the individual human being who inspires it is nothing if abstracted from the great human whole to which he belongs. Individual existence becomes empty and meaningless just so far as it ceases to serve that larger whole. And that is why love is

always ready for the supreme sacrifice. For those who desire before all else to be proud of the beings they love, the death of these is always preferable to their dishonor.

The feeling of the individual for his country must be extraordinarily powerful when it leads him to sacrifice not only his "self" but that which is far dearer to him—to wit, *everything that he loves*.

Now when human slaughter is going on on an unprecedented scale, when acute hatred and distrust are in the air, "now, more than ever the unity of our history comes into view." The writer, being a Russian, as a matter of course alludes to the history of Russia but his findings apply nevertheless to the histories of all the other nations who are engaged in the terrific conflict. Says the writer:

We are conscious of it even at those very points where until now it seemed most obscure, where the breach between past and present seemed final, when a great gulf divided the fathers from the sons.

This change is seen, for example, in the new feeling evoked in us by the ancient monuments of our national culture.

The writer tells us that he recently visited "one of the most beautiful examples of Russian religious architecture in the seventeenth century—the church of St. John the Baptist at Jaroslawle." Says he:

This was not the first time I had admired it; I had often seen it twenty-three years earlier; but at that time something was wanting to the wholeness of my impression; there was some inward inhibition of my enjoyment. But now the inhibition had vanished. I was overcome by the colors and beautiful lines of the architecture, because, for the first time, I was conscious that the spiritual life which formed these things is not our past alone, but our present as well.

Among the frescoes of this church there is one, of outstanding loveliness, which expresses its whole idea. It is the image of the Baptist—the face noble and severe, the arms and limbs much emaciated and refined by asceticism. The whole is surrounded with the powerful wings of an angel.

Many centuries of our history have expressed their innermost thought and spirit in the symbolism of this fresco. It speaks to us of the spiritual growth of ancient Russia accomplished in the midst of much bodily weakness. Her physical organs were weak, so much the more did her soul soar up on these splendid wings. As I examined the church with this thought in my mind I saw clearly that the same idea was embodied in the eternal architecture, which stands out in striking contrast to its surroundings. This temple of costly stone, with its golden pinnacles flashing their light under the blue of heaven, richly decorated with paintings in bright and varied colors, is built in the midst of one of the poorest quarters of a poor country town. The majesty and splendor of its lines inevitably remind the beholder of the powerful wings of the angel: while the surrounding hovels, miserable wooden huts inhabited by the poorest people, are the counterpart to the emaciated limbs of the forerunner of Jesus.

The following observations of the writer

contain much truth. They prove the writer's remarkable insight into the heart of things.

This renaissance of human solidarity is one of the most paradoxical, and yet typical, features of the war. Nor is it merely among living contemporaries that these bonds of union come into being. In these grand moments of history we see the centuries draw near to one another, the past joins hands with the present. And then it is that this past grows very dear to our hearts; because, when war threatens, the past represents an ancient glory for which we are fighting, a heritage of our fathers of which someone would rob us, the tradition of a culture which we are defending against the enemy. It is precisely by this link with the past that we become a nation. To be conscious of it is to feel that our fathers are with us; for our country is precisely "the land of our fathers."

What gives a nation its essential characteristic is not its mere possession of riches, but the way it values and employs them. And can we not discern at the present moment a great change in this respect? Do we not perceive that the heart of man is now breaking the chain which binds it to mere comfort and material pleasure? Do we not see from day to day the growth of a superb contempt for mere bodily ease—that contempt without which there would be no more heroes in the world? And, this orgy of universal destruction which is setting the world on fire—does it not enable us to rate at their proper value both the wealth which is being burnt up and the material culture which has thus perfected the instrument of its own ruin?

The individuality of nations derives its content and value from a universal principle which stands above all the nations and unites them in the whole of humanity. If we eliminate the universal characteristics of a nation which form the link of connection between itself and others, its individuality vanishes.

The spirit of unity and of universal solidarity bloweth where it listeth; it knows no limits of geography or race; the impulse which stirs it cannot be arrested by artificial barriers, by fortifications or great guns. From the very heart of war there issues this mighty protest of life against the destructive force of death. But whenever life asserts itself, its object is always to re-establish a living unity. The more violently unity is threatened by war, or by the mutual hate which would tear it asunder, the more powerful becomes the answer of this spiritual force in its effort to re-establish the integrity of mankind.

As an instance in point the writer refers to the "touching description of the Christmas festival in the trenches, when the Germans, hearing the English singing their hymns, went out to meet them and heartily shook their enemies by the hand."

In the October number of the *United Empire* H. S. Gullett discusses about the ways and means of

Strengthening the British Empire.

The writer is of the opinion that

"While the war is disrupting Europe, it is each day consolidating the British Empire. The Canadi-

ans, Australians, South Africans, and New Zealanders, and the people of the United Kingdom are immeasurably nearer in sentiment and ideals than they were a year ago. The common peril has demonstrated our common blood and speech, our love of freedom, and our antagonism to the bully. Every casualty in our grand Empire Army strengthens and consecrates the Imperial bond.

He is very optimistic about the growth of the British Empires. Says he:

One need know but very little about the new lands of the British Empire to recognise that a century hence, or less, their population and their wealth, or, in other words their fighting capacity, will have been doubled again and again. The self governing Dominions sent some 40,000 men to the war in South Africa; in connection with the present great struggle they have actually at the battle fronts and in the course of training about 250,000 troops, more rather than less. All going well, they could twenty years hence easily put a couple of million men into the field in any part of the world, in addition to furnishing a great naval force. At each successive Empire call it will be found that the part played by the children will be relatively stronger in men and money and ships until, far sooner than most of us anticipate, Britain's fighting capacity will be greater beyond the seas than it is in these Islands. When that day comes the world will be nearer to peace than it has ever been before.

The writer, though an imperialist, is not blind to the dangers threatening the British Empire, especially the Overseas Empire. For we read:

Imperialists glibly talk of the Empire as though all the lands which fly the British flag must continue to do so indefinitely. But let us be frank about the real position. It is by no means certain that Britain will rule the whole of Australia, or the whole of Canada, fifty or even twenty-five years hence. The loyalty of the Dominions is not in doubt. The danger is elsewhere. So long as the great majority of the people of the Empire Overseas are of Anglo-Saxon origin, they will adhere strongly and proudly to the British Crown. The disturbing factor is that we live in an exceedingly ambitious land-hungry age in which solemn treaties are lightly honoured. Everywhere the clamour is for more territory. Within the past few years war after war has been waged, and despite the attempts of the aggressors to cover their design the aim in nearly every case has been material gain. The richest of all the unpeopled defenceless lands are those which comprise our self-governing Dominions.

Perhaps the Empire is too large; perhaps we are attempting too much. But the tendency is to acquire more and still more territory, and to add year by year to our monster task of colonising. We who live Overseas are already spread very thin; after the War our grip, unless we are strongly reinforced, will be precarious indeed. There is grave danger that unless the position is faced squarely by leaders in the United Kingdom and the Dominions our success and our insatiate appetite for more territory will prove our undoing.

As a remedy the writer proposes:

The first care should be to make the Empire safe against the foreign aggressor and that can only be done by putting into every fertile portion of it the

largest possible British population at the earliest possible moment. People the Dominions with Anglo-Saxons, and the strongest and best, and the only bond worth having, the bond of blood and sentiment, is already established. The rest will follow naturally. When the War is over give to the young lands Overseas every man, woman, and child who can be spared.

We want after the war a general recognition of the fact that our best allies are our own British people living in every portion of the world. They, and they alone, are the allies who will stand the test of time and the strain of circumstance.

The most remarkable feature of this article is that nowhere is there a mention of even the name of India. It seems, the writer in his enthusiasm about the future growth and prosperity of the British Empire forgot the existence of India, without which the British Empire could not have been what it is.

Rabindranath Tagore: as seen through Japanese Eyes.

We all know how deeply the writings of our Poet have moved the cultured mind of Europe and America; but up till now we did not know what the cultured Japanese thought of his writings. To the *Journal of the Indo-Japanese Association* for August Prof. T. Hirose of Keio University, Tokio, contributes an article on our Poet which makes us familiar with the views of a few Japanese critics on the writings of Rabindranath. It is not possible to judge the true worth or properly appreciate the merit of Rabindranath's works unless one is familiar with his contributions in literature which are vast and varied. The foreigner can reach his works only through translations in which much of the beauty and grandeur of the original is lost. That explains why oftentimes the foreign critic's judgment is faulty and falls out of the mark. This can be said of some of the views of the Japanese critic Mitsui which are quoted below.

Prof. Hirose writes:

Mr. Mitsui's remarks greatly satisfy us in that it touches Tagore's views on moral philosophy. While tracing the fountain-head of the stream that has fed the thoughts of Tagore to the mythology, philosophy and religion of ancient India, Mr. Mitsui emphasizes the impossibility of reviving the cosmic view or life-view of the ancients in its original form, and argues that Tagore's mission lies where the strains of his thoughts can not be considered separately from the life of the contemporary Indian people. But, he says, there seems to be too much of intellectual reasoning where Tagore attaches importance to quotations from the classics of the old saints. The mystic tendency of all religions is a evil resulting from the

precedence of intellectual reasoning or supposition over experience and it must be taken into account that the presence of a somewhat mystic tendency in Tagore's religious views reflects the influence of the political conditions of the present India. The activities of a nation begin with their spiritual movement, and treating Tagore as a mere thinker, it is a question whether his thoughts are supported by internal necessity that reacts within and without. The critic recognizes the course of Tagore's moral ideas in his criticism of European civilization, but he regrets to find in Tagore's thoughts and his literary productions traces of efforts or tendency to try to escape from the actualities of life. We Japanese do not attach much importance to what is novel, or romantic or mystic about his teachings, but want to learn something from him on a more sober subject—his views on morality.

In my humble opinion, Tagore is a man of the first-rate literary ability in the Orient and at the same time there is none in the Occident to compare or compete with him at present. Since the opening of intercourse with the Western countries and the introduction of advanced Western civilization our thinking world has been invaded by Western thoughts and apparently we have gradually lost some of the traditional traits of old Japan. Of late we have awakened to the inadvisability of discarding our own ways and manners in our zeal to take good things from other nations. It is a matter for congratulation that the thoughts of Tagore have found their way to the minds of thinking Japanese, who have begun to awake from their exclusive adoration of Western civilization, and have aroused within them a spirit to love and respect the old traditions of their own country. In that respect, I think, our nation is greatly indebted to Mr. Tagore.

War Philosophy, Hindu and Christian 1500 B.C. and 1915 A.D.

is the title of an interesting article contributed to the *Hibbert Journal* by S. M. Mitra. For his article the writer has largely drawn upon the *Mahabharata*, the great Hindu epic.

Says Mr. Mitra:

The Western conferences which have met from time to time during more than fifty years to discuss the laws of peace and war are the development of the principles enunciated in the seventeenth century of this era by the famous Dutchman Grotius, whose *De Jure Belli ac Pacis* is generally regarded as the foundation of the Western science of international law. But the literature and history of India show that my countrymen anticipated Grotius by about thirty centuries that they forestalled the Conferences of Geneva (1864, 1868, and 1906), St. Petersburg (1868), Brussels (1874), and the Hague (1899 and 1907), that they had rules of warfare laid down about fifteen centuries before the Christian era, and very similar to many important regulations of modern international law.

The ancient Hindu's general outlook on War:

The ancient Hindus believed war to be a necessity; though they did not allow overmastering desire for conquest to overrule their love of peace. The Hindu

sages held that peace was the normal state of human society, and war its abnormal condition. Their rules for establishing and maintaining peace were as precise as their rules for waging war.

We read further :

The huge epic of the *Mahabharata*, composed about 1500 B. C. shows that both the morality and the expediency of war were discussed at length by the ancient Hindus. Sometimes they debated whether war was a profitable investment for a country, as some modern Western thinkers have lately been doing. "The king should gain victories without battles. . . . The clash of battle is undesirable as long as one can avoid it," said Bhishma, the mighty commander of the Kauravas, and the great philosophic warrior-statesman. "Men have five different kinds of strength," declared Vidura, another Hindu statesman of the *Mahabharata*, "strength of arms, good counsellors, wealth, birth, and strength of intellect. Strength of arms is inferior to all these others." "Shun the waging of war for the acquisition of territory. Territory should be gained by conciliation, by gifts, and by exciting dissension among other kingdoms." This last means of enlarging a nation's boundaries recalls the famous Roman motto of later centuries, *Divide et impera*, which foreign rulers still regard as a highly useful maxim. One of the Hindu arguments against acquisition of territory by force is worth consideration : "The energy necessary for putting down a hostile kingdom would be better expended in care of one's own kingdom."

Treaties and Alliances :

Treaties and alliances held prominent place among various methods, resembling those of modern times, which the ancient Hindus adopted for avoiding war and for strengthening themselves to resist attack. They distinguished roughly three kinds of treaties :— (1) Those made through fear. The volumes of Ardenison's *Treaties and Sanads* supply numerous examples from modern Indian history of agreements which small rajas and petty chiefs have made with the Government of India to ensure themselves against aggression from powerful maharajas. (2) Those made through good offices. The present alliance between the Maharaja of Nepal and the Government of India, largely based upon the good offices rendered by the Nepal State during the Indian Mutiny, affords a modern instance of this kind of treaty. (3) Those made through gifts of wealth, i.e., through a subsidy. As representative of this class, the treaty may be instanced by which the Government of India enters into an alliance with the Amir of Afghanistan and gives him annually a large sum of money, in return for which the Amir agrees to form no alliance with any foreign power without the consent of the British.

In those ancient days alliances were regarded as invaluable aids to peace and supports in war. "There is nothing that cannot be achieved by alliances," asserted Vidura. "The tiger outside the forest," said Krishna, "falls an easy prey ; the forest wherein no tiger dwells is easily cut down ; hence the tiger guards the forest and the forest guards the tiger."

"A man," said Bhishma, "crosses a deep broad river by a log. The man conveys the log to the other side, and the log also conveys the man." To these ancient statesmen successful alliances and counter-alliances were as necessary a part of policy as war. "When a common danger threatens, make peace," they advised, "with one who is strong. When the danger is over consider

well the advisability of making a compact with the enemy. Having achieved the object in view, trust not the foe again."

International friendships and Diplomacy :

Bhishma's description of the friends of a monarch aptly summarized the factors that go to make modern international friendships, and his counsel, applied to nations, was evidently taken as a guiding principle by the ancient Hindus in making peace and war. According to him, the different friends of a ruler were : (1) one who pursues the same object ; (2) one who is exceedingly attached to him ; (3) one who is related to him ; (4) one whose good will has been gained by presents and kindness ; and (5) an upright man who will range himself on one side and not on both. Of these kinds of friendship," said Bhishma, "look with mistrust upon the first and fourth ; at the same time do not trust any overmuch. Trust and mistrust all men. Mistrust him as an enemy who would profit by your own destruction, but trust him entirely whose fall would be the consequence of your own fall." Already in Bhishma's time the intimate connection between war and politics was realized, and Hindu statesmen were divided as to whether war is an outgrowth of politics or politics an outgrowth of war. Before resorting to force, the peoples of ancient India who were involved in disputes, dispatched diplomatic agents or envoys (duta) to each other to try what could be effected by peaceful persuasion. The ablest brains of the nation were pressed into this service "They should," said Bhishma, "possess these great qualities : noble birth, eloquence, ability, pleasant address, reliability in delivering the message entrusted to them, and a good memory."

Secret service system and the question of Neutrals :

Ancient India had a great secret service system with approved rules. "Spies were as eyes to the kings of ancient India, and as roots to their kingdoms." Inattention to spies is mentioned by Vidura as one of the causes of the downfall of a king.

Several centuries before the birth of Greece and Rome, students of war philosophy in India had gone deep into the question of neutrals, and had divided them into four main heads :—(1) Neutrals who, whether active or passive, could not but be affected by the progress and result of the war (2) Neutrals who would be practically unaffected by the war, and therefore felt hardly any concern in the progress of the struggle. (3) Neutrals who would be affected by the progress and result of the war, and who could, if they chose, alter the course of the war without becoming belligerents by manipulating economic forces, etc. (4) Neutrals who, though affected by the war, had not the power to alter the course of the war, like China in the present instance.

How war was conducted by the Ancient Hindus, and the treatment meted out to prisoners of War :

Indiscriminate slaughter was regarded by Hindu warrior-statesmen as both inhuman and inexpedient. A retreating enemy, they said, was not to be pursued too closely, lest he should suddenly turn and rend his pursuers, and also because brave men do not care to mow down those who flee before them. "A king," quoted Bhishma, "should never slay a large proportion of the forces of the foe, though he should do sufficient to render his victory sure. He should never

inflict such injury as would leave a lasting memory of humiliation in the enemy's heart.

The Hindus maintained that it was better to go down before the foe than to conquer by wrongful methods. "A victory sullied by unrighteousness," they said, "is insecure, and never brings one to heaven."

In certain particulars the Hindu's sense of fair play far exceeded that which now prevails in warfare. Bhishma's rule of battle was, "mailed soldier against mailed soldier, cavalry against cavalry." Manu, the ancient Hindu lawgiver, maintained that battles were to be contested fairly. Other definite rules for the conduct of warfare are clearly anticipations of the principles set forth by the Geneva Conventions, and the Hague Conferences. "Neither poisoned nor barbed arrows should be used," said Bhishma, over thirty centuries before Convention IV., Article 23 (a), of the Hague Conferences forbade belligerents "to employ poison or poisoned arms." "A feeble or wounded opponent should not be slain," said Bhishma, "or he whose weapon has been broken. . . . One should fight one adversary and leave him when he is disabled. . . . A warrior whose armor has fallen off, or who begs for quarter, . . . or who has cast aside his weapon, may be taken prisoner, but never slain."

The ancient Hindus guarded against maltreatment of war prisoners by dividing them into two classes: the well-to-do, who were kept as hostages against unfair warfare on the part of their enemies; and the ordinary prisoners, who were placed under the supervision of the authorities in charge of temples and shrines. According to Bhishma, those prisoners whose wounds permanently disabled them from military service were to be sent home; others were to be taken to the victor's camp, and their hurts attended to there. These regulations for the humane treatment of prisoners may be compared with Chapter I., Article 1, of the Geneva Convention of 1906: "Soldiers, and other persons officially attached to armies, shall be respected and taken care of when wounded or sick, by the belligerent in whose power they may be. . . ." and part of Article 2, Chapter I., of the same Convention: "Belligerents. . . will be at liberty to agree: to restore to one another the wounded left on the field after a battle; to repatriate any wounded and sick whom they do not wish to retain as prisoners. . . ."

The war lords of ancient India advised moderation, urging the victor to protect a conquered country from useless plunder. "Refrain from profitless deeds of hostility, and also from insolent speech," is counsel to which Bhishma gives approval. But when a people offered obstinate and determined resistance to the invader, the attacking Power was advised to adopt sterner tactics, "slaughtering the population, pulling up the roads, setting fire to and knocking down its houses."

Western international law decrees that the person of an ambassador is inviolable. Similarly, in ancient India, to slay or imprison envoys was a heinous sin. "It was forbidden to slay one who was asleep, or weary, or whose armor and weapons had fallen off, a fugitive, one who was walking along a road unaware of danger, the insane, the mortally wounded, one who was greatly enfeebled by wounds, one who lingered trustfully, one who was absorbed in grief, foraging parties, camp-followers, servants, old men, children, and women."

Mr. Mitra has shown in his article that

even the ultra-modern problem of the "War baby" was satisfactorily solved by our forefathers. Doubtless this problem has been present from time immemorial.

Says Mr. Mitra:

Even the latest difficulty of the "war baby" received the attention of my distinguished countrymen in that dawn of time. To prevent the destruction of infant life and to save the children from being branded as bastards, the alliances that were responsible for "war babies" were raised to the status of marriage. Three classes of such alliances were recognized: (1) "the reciprocal connection of a youth and a maiden with mutual desire," denominated a Gandharva marriage; (2) when the lover secretly embraces the maiden, flushed with strong liquor, or disordered in her intellect," called a Pisacha marriage; and (3) "the seizure of a maiden by force from her house, while she weeps and calls for assistance, after her kinsmen and friends have been slain in battle or wounded," styled a Rakshasa marriage. The expense of the maintenance of the offspring of these alliances was borne by the Church, the army, and the civil ratepayers, the proportion contributed by each of these bodies being fixed according to certain rules.

About the treatment of the vanquished foe, we read:

Conquered kingdoms paid war indemnities. There were rules regulating the confiscation of the property of the vanquished. Scholars and philosophers belonging to the conquering party were given certain prizes taken from the conquered. The conqueror's attitude was to be a diplomatic blend of mildness and severity. "Before striking the blow, and while striking, speak gracious words, having struck, show pity towards the conquered." The people were to be protected from pillage, slaughter, and pain; but a conquered foe was to be kept in submission, as a father masters and restrains his son, without anger and without destroying him. "Put no trust in a vanquished foe," was another Hindu maxim; and "when one's enemies have been subdued, one should not repose in peace." "A king should bring over a hero to his side by showing appreciation of him; a coward, by making him afraid; an avaricious man, by bestowing wealth upon him; and with an equal he should wage war."

Death in battle—how it was looked upon.

To the ancient Hindus righteous battle was a virtue, and the high merit, glory, and respect earned by the warrior who met with death in such a combat made him envied by his fellows. "All the Kshatriyas, O King," said Krishna, "who have fallen in this mighty conflict. . . were heroes and ornaments of battle. They were slain while charging with faces towards their foes. None fell wounded in the back or flying from the enemy. All of them. . . have attained to heaven. Thou shouldst not mourn for them." "Life laid down in battle," it is written, "is for heroes the blessed gate to heaven." But "the gods themselves with Indra at their head send misfortunes upon them who desert their comrades and return with limbs unscathed from the fray."

The ancient Hindus were wise enough to admit that warfare could not "always

he waged in a thoroughly straightforward manner."

"Both kinds of wisdom, straight and crooked, should be at the king's command," declared Bhishma, "yet though he be conversant with it, he should not employ the crooked wisdom as aggressor. He may use it to oppose the dangers that come upon him."

The Constitution of Armies and Conscription:

Armies, consisted of four main divisions: (1) regulars, (2) allies, (3) mercenaries, and (4) irregulars, each made up of eight parts—cars, elephants, horses, officers, infantry, camp followers, spies, and ensigns. There were volunteers among the ancient Hindu armies, and it should be noted that according to the Hindu idea of chivalry a volunteer is a man who refuses all rewards, even decorations, for he is risking his life only for the sake of his country. Subsidies were paid to certain peoples in return for military service, if required. The army had rules for various formations of troops, systems of signalling, armor, weapons, various badges, generous rewards for valor, medical corps with equipment in attendance at the camps, and envoys whose mission it was to treat with the foe. To some extent the ancient Hindu military system resembled Western conscription: but whereas in the West a conscript nation means practi-

cally a whole nation liable to military service, the ancient Hindus divided the nation into four classes, only one of which, the Kshatriya, was the warrior class, every member of which had to train and be ready to fight for his country.

The strategy of War—as practised by the Ancient Hindu:

Unexpected and superior preparation for war, and unexpected attack, are in his opinion highly important principles of strategy. What are these but Bhishma's ideas enunciated over thirty centuries before?—"The gathering together of troops for achieving victory should be concealed." He who wishes to destroy an enemy should not put that enemy on his guard. "A king who is sure of his own strength should, in command of a large force, confidently and bravely give the order to advance, without making known his destination, against one who has no friends or allies, or who is already at war with another, or who is weaker than he." The law of expediency was the essence of Hindu policy. "When the time comes, make peace with a foe, when the time comes, wage war against a friend." By nature no one is the enemy of another," said the Hindu. He only is one's enemy who covets the same prize. Hindu strategists believed in decisive action. "A king should wait long and then destroy his enemy. . . . When the occasion comes, he should attack him without missing the opportunity."

THE LATE MR. U. RAY

MR. Upendrakishor Ray Chaudhuri, better known as U. Ray, was born at the village of Masua in the district of Mymensingh in the year 1862. His father "Munshi" Syamsundar Ray was a reputed Persian and Sanskrit scholar and a man of fearless independence. He was called 'Munshi' because of his Persian scholarship. He is known to have been a man of fine literary attainments and used to perform his daily devotions with the help of Sanskrit *Stotras* (hymns) of his own composition. His Sanskrit scholarship was recognised even by the orthodox Brahmin pandits who often invited him to arbitrate in their shastric discussions. Known in early life as Kamadaranjan Ray, Upendrakishor came to be adopted by his uncle Babu Harikishor Ray Chaudhuri, a well-known Zamindar and Pleader of Mymensingh, who gave him the name by which he has been known since then.

He matriculated from the Mymensingh

Zilla School, obtaining a Government scholarship of Rs. 15 per month. While a student at School he displayed marked mathematical and scientific talents, but even at that early period his attention was largely claimed by the fine arts. Alone and unaided he mastered the mysteries of light, shade and perspective. The drawings which he lavished upon his books and papers in his school-boy days excited the admiration of his teachers. So great was his passion for music that the first instalments of his scholarship were entirely spent on musical instruments. His passion for science, too, went hand in hand with his devotion to the fine arts.

After matriculating he studied at the Presidency College in Calcutta and afterwards at the Metropolitan Institution, whence he took his B.A. degree in the year 1884. During his early College days he constructed with his own hands a working model of a gyroscope out of an wooden ball and a few bits of wood. His academic

career was, however, cut short by the domestic troubles that followed his joining the Brahmo Samaj.

His interest in juvenile literature was directly due to coming in constant touch with the late Babu Pramada Charan Sen, the founder of the "Sakha," one of the earliest and most successful Bengali magazines for children. The interest thus aroused had a permanent hold on him and the education and entertainment of children was one of the absorbing passions of his life.

His contributions to the juvenile literature of Bengal are well-known to all educated Bengalis. His *Sekaler Katha* is a popular illustrated account of the many strange animals which lived on our earth before the birth of man and as the contemporaries of primitive man. Though a book meant for children, it shows his thorough grasp of the subject. The illustrations were from his own original drawings. His *Tuntunir Boi* is a highly enjoyable book of folktales. He popularised the stories of the Ramayan and the Mahabharat in such juvenile works as *Chheleder Ramayan*, *Chheleder Mahabharat*, *Mahabharater Galpa*, and *Chhotta Ramayan*. In his children's monthly, the *Sandesh*, he popularised stories from the Purans, along with many scientific subjects. This magazine at once took its place as the premier juvenile magazine as soon as it was published. This magazine, as well as all his other works, he illustrated himself. He excelled and was unrivalled as a comic illustrator of children's books. His fine humour lighted up on whatever subject he wrote, whether science, travels, mythological stories, folktales or music. He was a man of deep and wide culture, and wrote, not like a mere compiler or translator, but as one who had mastered his subject. His discourses on music, astronomy, &c., were highly appreciated. His talks to children were eagerly looked forward to by the little folks, and were as humorous and entertaining as they were instructive.

He has left some fine hymns, thereby enriching the hymnology of the Brahmo Samaj.

It was while engaged in publishing one of his first books for children that the wretched condition of the book and magazine illustrations in our country was first brought home to him. He forthwith took up the study of photo-engraving and in 1895 brought out the necessary apparatus

for producing halftone blocks. In this work of improving the half-tone process, he spent quite a fortune, unmindful of what pecuniary returns he might or might not get from his labours. The half-tone process was at that time still in its infancy, and its underlying principles were but little understood. Unsettled and arbitrary rule-of-thumb methods found little guidance from the conflict of theories, each claiming to be an all-sufficient explanation of the mystery of the half-tone image. With characteristic thoroughness and independence, Mr. Ray proceeded to tackle the problem afresh in his own way. He examined the claims of various rival theories and arrived at conclusions of far-reaching importance that have since found almost universal acceptance. The standardizing of half-tone methods in recent years has largely followed the lines indicated by him and many of his suggestions have been adopted in current practice. Mr. Howard Farmer of the Polytechnic, in a paper before the Royal Photographic Society, specially mentions "Mr. U. Ray, a very clever writer on the subject," as one of the authorities whose brilliant advocacy of the pin-hole theory, "has determined its general acceptance." N. S. Amstutz of America in his "Handbook of Photo-engraving" and his contributions to various societies, refers extensively and appreciatively to his earlier writings and points out that modern practice in half-tone work had been largely anticipated by him. The Editor's notes on "Mr. U. Ray's half-tone researches" in the 1904-5 Volume of Penrose's Annual speaks of "the classical pen of Mr. U. Ray" and goes on to say: "Mr. Ray is evidently possessed of a mathematical quality of mind, and he has reasoned out for himself the problems of half-tone work in a remarkably successful manner. Those who have the earlier volumes of Process Work will do well to turn to his articles and they will be found to well repay perusal by the increased interest they gain in the light of present day methods."

William Gamble, F.R.P.S., in his article on "A Wonderful Process" in the Process Year Book, speaks of "investigators of the highest eminence, amongst whom I may mention.....U. Ray of Calcutta, whose admirable articles in the Year Book have shown not only a clear grasp of the subject but have suggested new methods of work."

His screen adjusting machine, his diaphragms systems, his contributions to the theory of half-tone, his invention of the 60" screen, his highly instructive studies in diffraction and his original methods of colour work have all received very favourable notices in the technical press of Europe and America. Amstutz describes his screen adjusting process as a "unique method." Verfasser calls it the "most promising idea of this kind." This apparatus has been supplied to some of the leading technical schools in England where it has been reported upon very favourably. The nett result of these researches is to enable the operator "to do uniform work, with the fullest graduation and detail in it and with the minimum amount of manipulative skill in the negative making and etching." (Penrose's Annual, 1904-5).

The same article describes the results obtainable by Mr. Ray's methods as "wonderfully good." "Process Work and Electrotyping," in a highly eulogistic reference to some particular applications of his methods, says: "Mr. Upendrakisor Ray of Calcutta.....is far ahead of European and American workers in originality, which is all the more surprising when we consider how far he is from the hub-centres of process work."

The Jubilee number of the British Journal of Photography (1904) says:—"The question of multiple diaphragms has really a very important bearing on the future of half-tone; and the only worker I know of who has thoroughly grasped the bearing of it is U. Ray of Calcutta. He has brought it to a mathematical exactness."

The interest roused by his articles has been world-wide, for Mr. Gamble writes that he often receives "enquiries from all parts of the world concerning them." They have frequently been referred to as models of lucid and accurate exposition.

References to Mr. Ray's work are also to be found in various text books and technical journals, including *Le Procédé* (Paris). The *Illustrator*, The *Inland Printer* (U.S.A.), *Process Work and Printer*, *Process Photogram*, *Process Engraver's Monthly* &c.

During the last few years of his life Mr. Ray had practically retired from his half-tone business, leaving it to be carried on by his two elder sons. His eldest son, Mr. Sukumar Ray, B.Sc., who has inherited to a great extent his

father's versatile genius, is, at present the most scientific and skillful photo-engraver among Bengalis, having received his training first under his father, and in London and Manchester as a Calcutta University Guruprasanna Ghosh Scholar.

Mr. U. Ray was a noted artist, and used both oil and water colours, particularly the latter. It was as a landscape-painter that he specially excelled.

He had made a deep and extensive study of the theory and practice of music; vocal and instrumental. Just as his knowledge of optics stood him in good stead in his researches and inventions in the half-tone process, so did his knowledge of acoustics enable him to master the science of music. He could play on the flute, harmonium, violin, piano, *setar*, *tanpura* and *pakhwaj*, but it was as a violinist that he was most appreciated. Though not a professional teacher of music, his skill and success in teaching the art was very remarkable. Years ago he had written a "Harmonium Teacher" in Bengali. It was in great demand. But as he had latterly become convinced that the harmonium had done and was doing incalculable injury to Indian music, he did not agree to issue a new edition of the book in spite of the urgent requests of his publisher; so it has been out of print for years.

In his youth he was a noted cricket player. He was regular in his habits and took his constitutional regularly till the day previous to his last illness. But he had most probably overworked himself, becoming a diabetic in consequence, and fell a victim to the fell disease at the early age of 53. He breathed his last on December 20, 1915.

Our brief sketch will give the reader some idea of his varied gifts; but no pen-picture can convey an adequate idea of the kind of man he was. His genial presence and charming conversation will be long remembered. He had a very affectionate heart, and was extremely modest and courteous. He was at the same time possessed of a sturdy independence of character which is not quite common. He had nothing of what is called "push," being of a retiring disposition, and avoiding the glare of fame and publicity. He was a true *bhakta* (भक्त) a devout worshipper of Parabrahma, possessed of a deep, genuine and unostentatious piety.

THE CO-OPERATIVE MOVEMENT IN INDIA

PEOPLE are, generally, sceptical as to the merits of any universal panacea, whether it be for the ailments of the physical or social body. The science of Political Economy, conceived by Adam Smith, supported by Malthus, shaped by Ricardo, perfected and polished by John Stuart Mill, and interpreted for popular comprehension, adaptation and adoption by Henry Fawcett, Henry George and Cecil Balfour Phipson as well as by others, has offered many suggestions for the solution of the economic problems of the human society; but the millenium is still far from sight. All the same, what these master minds have thought and enunciated on such an important subject as Co-operation affecting the good of the community at large, deserves serious attention and consideration of us all.

Mill, writing on Co-operation, says:—

"...The peculiar characteristic, in short, of civilized beings, is the capacity of co-operation, and this, like other faculties, tends to improve by practice, and becomes capable of assuming a constantly wider sphere of action. Accordingly there is no more certain incident of the progressive change taking place in society, than the continual growth of the principle and practice of co-operation. Associations of individuals voluntarily combining their small contributions, now perform works, both of an industrial and of many other characters, which no one person or small number of persons are rich enough to accomplish, or for the performance of which the few persons capable of accomplishing them were formerly enabled to exact the most inordinate remuneration. As wealth increases and business capacity improves, we may look forward to a great extension of establishments, both for industrial and other purposes, formed by the collective contributions of large numbers, establishments like those called by the technical name of joint-stock companies, or the associations less formally constituted, which are so numerous in England, to raise funds for public or philanthropic objects, or lastly, those associations of workpeople, either for production or to buy goods for their common consumption, which are now known by the name of co-operative societies" [*Principles of Political Economy, Book IV., Chap. I, Sec. 2, p. 423*]

Writing on the same subject, Fawcett observes:—

"..... Anyone who considers what it has already effected, and what it is capable of doing in the future, must, we think, come to the conclusion that we may look with more confidence to co-operation than to any other economic agency to improve the individual condition of the country" (*Manual of Political Economy, Book II, Chapter X, p. 281*.)

Fawcett adds:—

"It cannot be too carefully borne in mind that those who have achieved the most striking success in co-operation have not been assisted by any extraneous aid. They have placed their chief reliance in union of effort, in prudence, and in self-denial" [*Ibid.*]

And he gives instances of such success by citing the cases of Co-operative Banks in Germany established first by M. Schulze-Delitzsch in 1851, and the first of those started in England at New Castle-on-Tyne, in 1871, mainly through the exertions of Dr. Rutherford, the accounts of the developments of which are, indeed, highly interesting. But even before the advent of the co-operative idea in England and Germany it had been established in France; for among the institutions of credit and *prevoyance* established for or by the *ouvriers*, Lyons possessed, before 1848, a *caisse d'prêts* [banks for lending money] for the *chefs-d'atelier*, and a considerable number of mutual aid societies.

The growth and development of the Co-operative movement in this country, which is only of recent origin, tends undoubtedly to show, that more in this respect has been achieved in India in about a decade or so than in the countries of Europe in three quarters of a century, more or less. The reason for this rather astonishing progress in India is not far to seek. The success of the movement in this country, so far at least as the speediness of its growth indicates, is undoubtedly due to the fact that it was not only initiated by the Government but from the very outset of its being it has received the fostering care of our rulers, who, unlike in the progressive countries of Europe, must always be at the helm to render help in such matters to the people who seem otherwise to be utterly helpless—for even their educated leaders are generally quite apathetic and indifferent with regard to them. The speedy progress of the Co-operative movement in India, however, clearly demonstrates the fact that our people, conservative as they are in many matters, in a matter of this kind, when properly initiated, trained and directed, are seldom

slow or backward in accepting and adopting methods meant for their own relief and regeneration.

The following tables give an analysis, in brief, of the Co-operative Societies in India at the end of the year 1913-14:—

Particulars.	Agri- cultural Societies	Central Societies.
Class of Societies—		
Credit	14,364	320
Purchase, and Purchase and Sale	12	...
Production	4	8
Production and Sale... ..	78	...
Insurance	69	...
Other forms of Co-operation	11	1
Type of Societies—		
Central Banks...	111
Central Banking Unions	89
Unions	129
Limited	169	...
Unlimited	14,369	...
Number of Societies	14,538	329
Number of Members—		
Individuals	599,822	24,786
Societies	9,924
Number of Affiliated Societies—		
Central Credit	67
Agricultural Credit	10,843
Non-agricultural Credit	322
Others	17
Loans made to—		
Individuals } On Personal Security. 2,22,96,965	7,16,345	
} On Mortgage Security. 39,71,049	1,20,653	
Societies } Local	4,22,636	1,53,13,834
} Central	3,53,805	24,89,468
Sale of Goods to Members. 98,076	16,902	
Purchase of Members' Products. 98,940	8,010	
Cost of Management	2,62,285	2,81,033
Most Usual Dividend Paid on Shares	7 & 14 p.c. Bet. 6 & 9 p.c.	
Most Usual Rate of Interest—		
On Deposits	6½ & 9 p.c.	6 p.c.
On Loans	9½ & 12½ p.c.	Bet. 7 & 9 p.c.
Loans Due—		
By Individuals	3,62,84,418	16,62,869
By Societies	15,92,185	2,52,21,339
Share Capital	53,31,929	38,50,248
Members' Deposits	36,15,614	60,77,386
Loans from Government	9,72,554	1,02,376
Reserve Fund	24,55,218	5,60,790

The Co-operative movement is, indeed, still in its infancy in India, but in tracing its rapid development since its inauguration about a decade ago, we find the advantages which have already accrued to the country; and if the movement be persisted in it may surely be relied upon as any other form of economic agency to effect a marked and permanent improvement in the social and industrial condition of

the country. Though only of recent growth the movement has, all the same, we repeat, a hopeful future before it, although it has to pass through at present a critical period of its existence owing to the situation created by the war in Europe and several other causes over which we have but little control; and the annual reports on the Working of the Co-operative Societies in the different parts of India offer interesting study. The Reports on the whole, adverse circumstances to the contrary created by the war and other causes notwithstanding, are highly satisfactory and encouraging, in that on the whole, even in the most backward provinces, progress has been made and maintained in the way of expansion and the relations between the Co-operative movement and agriculture, in a country which is mainly agricultural, are becoming gradually greater and closer.

In 1913-14 the number of Societies of all descriptions in Bengal increased from 1123 to 1,663, or by 48 per cent., the total membership from 56,889 to 90,363, or by 59 per cent., and the working capital from Rs. 46,07,301 to Rs. 89,40,803 or by 94 per cent. Satisfactory as these figures are, it is still more gratifying to find that the expansion of the movement has been accompanied by intensive development. The most noteworthy feature of the year under review has been the extension of the central bank system, on which depends largely the financing and supervision of individual rural societies. The number of central banks has increased from 17 to 33, and their working capital from 13 lakhs to 32 lakhs of rupees. Of this 32 lakhs, 27 lakhs is derived from deposits and 5 lakhs from share capital. The development of agricultural societies is also remarkable. The number of societies has increased from 1,039 to 1,543; the membership from 42,000 to 71,000; and the working capital from 22.75 lakhs to 44 lakhs of rupees. A sum of 30 lakhs was issued in loans to the members against 14 lakhs of the preceding year, and of the loans taken more than 28 lakhs were devoted to the payment of debts and other economic or productive purposes. Non-agricultural credit societies are also said to be working satisfactorily in Bengal and are being appreciated by the middle classes in the towns in which they have been started. The number of such societies has increased from 60 to 71, the membership from

11,164 to 13,653 and the working capital from 9 lakhs to 12 lakhs of rupees. The considerable increase in members' deposits indicates a satisfactory growth.

In the United Provinces of Agra and Oudh, we gather from the Report for the year 1914-15, the banks and societies were put in great straits during the year preceding to that to which the Report relates, owing, it is said, to the failure of the crops. Large loans had to be given to members to meet their requirements and thus their average liabilities had considerably went up. The hope that with the return of normal conditions the agriculturists would be in a position to redeem a large portion of their debts to the societies and that the central banks would be able to undertake the organisation of new societies in localities where there was a demand for them; hopes that the large outstanding loans of the previous year would be collected during 1914-15, were not realised—thus giving the movement in these Province rather a serious outlook. Nearly 17 lakhs of rupees were outstanding at the end of the preceding year, 27 lakhs were advanced during the year while the total repayments amounted to 29 lakhs, the outstanding at the end of the year being, thus, 45 lakhs. It is satisfactory, however, to note that with the exception of one or two areas, the general body of the members of the co-operative societies in the United Provinces were thoroughly loyal to their respective societies, and their failure to timely meet the demands of their societies was due mainly to the special circumstances of the year over which they had no control. So far, however, as the material welfare of the cultivating classes is concerned, co-operative activity in the United Provinces, is manifesting itself in the supply of good seed, solution of the problem of irrigation, the supply of water, the establishment of small plots for the demonstration of new staples, cattle-breeding, experiments in joint-cultivation and the supply of improved agricultural tools and implements. Thus, on the whole, although the progress made during the year under review has not been quite commensurate with the high hopes of all concerned, the Government of the Province is not prepared to see it suffer from causes outside its control. The uneasiness which took such a firm hold on the depositors of joint-stock

banks at the outbreak of the war, affected the depositors of co-operative banks in a small degree. The directors of the latter felt that they could refund all deposits that matured, but they could not at the same time issue liberal loans on *rabi* sowings, which was, indeed, very necessary both in view of the failure of previous crops and of the peculiar circumstances of the moment. To meet this extraordinary situation the Government granted to banks a limited sum in loans where otherwise the *rabi* seed advances would have been considerably jeopardised and Rs. 2,55,000 was received from Government for this purpose. The loan was to be repaid in two annual instalments, but the recovery of the banks was so rapid that it was repaid in full long before the loan fell due. The Central Societies showed a small increase, but the financial position of these societies on the whole improved during the year under notice. The reserve fund increased from 3.11 to 3.86 lakhs of rupees while the proportion of the paid-up share capital and reserve fund to the working capital rose from 15.9 per cent. to 18.1 percent. and deposits increased from 40.34 to 42.29 lakhs of rupees. Among agricultural primary societies the year has been more noticeable for re-organisation than expansion, but the number increased from 2,560 to 2,716 due to the conversion of affiliated societies of the old type into corporate self-managing village societies. Among non-credit societies the chief feature of the year has been the creation of four cattle insurance societies, which are largely experimental, and Government, we are glad to note, has promised to give them special aid, should such be necessary.

In the Central Provinces and Berar, we gather from the Report for 1914-15, the working of the Co-operative Societies, notwithstanding difficulties of all kinds arising from the failure of crops and the incidents of the war, went on all right, presenting many encouraging features. Notwithstanding the need for caution in expansion the number of Societies of all kinds has increased, during the year, from 2,213 to 2,297; membership from 40,415 to 44,084; and working capital from 65 to 72.5 lakhs of rupees. Yet only a fifth of the number of applications for registration could be accepted owing to lack of facilities for adequate control and supervision. Many unregistered societies, we are told,

are springing up in all directions in the Central Provinces and Berar and these require special care and supervision. In his resolution on the Report the Chief Commissioner takes note of the criticism generally levelled at it that the Co-operative movement is degenerating in those Provinces into a mere money-lending concern, and this criticism though carping in its character, will, says the Chief Commissioner, serve the purpose of warning against a great danger. Money-lending as the most obvious of all the advantages of co-operation, receives the largest amount of attention at the first stages, and as the movement is more correctly apprehended, its other advantages will not fail to receive the attention of the people.

The Report from the Punjab shows, that the initial impetus given to the Co-operative movement in that Province has not been kept up, the reason given being the same as in other parts of the country, namely the war in Europe and the failure of harvests at home. But despite the fact that there has been no increase in the number of societies and that of the members, there has been, it is interesting to note, an increase in the working capital of 7.25 lakhs of rupees. The Punjab Government observes that the year has been of a character to show a marked relief from both the dangers to which the societies under present conditions are exposed and also the vitality which has saved them from those dangers; and indeed nothing bears better witness to the solidity of the foundations on which the movement is based in that Province, than the manner in which it has passed through the crisis. Owing, however, to the general stagnation of business, and the consequent inability of the members to obtain loans from the societies, they have been obliged to have recourse to the usurious money-lenders to the extent of some 10 lakhs of rupees. Also, village societies have had in some cases to ask their depositors to wait, but the central banks have been able to meet their obligations, and there is everywhere evidence of the confidence of the cultivator in the soundness and stability of the movement. One of the most gratifying features of the time of stress through which the co-operative societies have generally passed has been the readiness with which the Government in all the different provinces have

them financially. Turning to the financial position of the societies in the Punjab we find that withdrawals of deposits have exceeded receipts by nearly 7 lakhs, but this deficiency has been more than made up by receipts under the head of share payments and interest. There has, thus, been a small increase in the working capital which now amounts to Rs. 1,30,63,842, but this total includes a large amount of profit which has not yet been received. The true working capital may, therefore, be put at Rs. 1,24,74,956, of which all but about 10 lakhs is utilised as loans to members. Of this 10 lakhs of rupees, nearly 2 lakhs have been invested in the form of shares in central societies, and are available at any time for loans to the village societies. The cash in hand is upwards of 7½ lakhs, and the balance is under "stock in hand." From the percentages of the items which compose the total working capital, it is shown, that the societies' own money forms nearly 42 per cent. of the whole, and if to this is added the members' deposits, then the latter forms more than 50 per cent. of the whole. So that from this point of view the position of the societies may also be considered as favourable. To boil the figures down to the definite results attained, the Registrar has had compiled from the societies' ledgers exact figures of the loans hitherto advanced to pay off old debts and mortgages. "The total of these," he says, "comes to Rs. 69,46,710 and Rs. 12,50,668, respectively. . . . It may be considered with certainty that Rs. 80 lakhs have been paid to money-lenders and mortgagees, resulting in the satisfying of money debts and mortgages of a considerably larger value. It will thus be seen that members have replaced one form of indebtedness amounting to at least 30 lakhs by another amounting to 72 lakhs, and they are still further this much to the good in so far as the interest they pay on the new form of debt is very much lighter than what they paid on the previous form, while they have recovered cultivating possession of valuable ancestral lands amounting to not less than 8000 acres." These conclusions are based on the calculation that of the working capital 41.7 per cent. consists of shares and profits received, which represent the members' savings, while the remainder, i.e., Rs. 72,36,675, is borrowed money. The fact that seems to stand out is that after paying off

come to and 80 lakhs of debt, members have accumulated savings of half a crore of rupees which they are now using in place of money-lenders' money, a fact which is, indeed, highly satisfactory.

The Reports on the Working of the various Co-operative Societies which we have dwelt upon at length are, it will be seen, suggestive of possible extension in the future, near or remote, rather than of actual progress in the immediate present—owing to the various drawbacks that have been incidentally indicated in the course of this article. One thing, however, that would strike the intelligent and knowing observer is that the Co-operative Societies in India are, so far, mere lending corporations; once the man in need of money obtains it as a loan he is apt to forget the various other calls the idea of co-operation suggests. It would, all the same, spell a ruin to the prospects of the progress of the country to withdraw the Co-operative Credit Act from operation because the people have not yet thoroughly realised the highest ideals of co-operation obtaining in the West. The bulk of the loans given, as we have seen, are for purposes of payment of old debts, rents, etc., by members, for which in the not long forgotten past the average borrower had to resort to the modern Shylock, the usurious Indian money-lender whose rate of interest is sometimes as high as 36 per cent. per annum! It is, however, not to be expected, that our illiterate villagers, however intelligent they may be, should be able to grasp true principles of co-operation obtaining in the countries of the West within a measurable distance of time, without undergoing a training for it; and it is inevitable that they should look upon themselves as members of Co-operative Credit Societies, merely as borrowers, and their societies as convenient agencies for securing loans of the nature of *takavies*.

The essential difference between the Co-operative movement in India and that in Europe is dwelt upon at length by Mr. A. C. Chatterjee, I.C.S., Registrar of Co-operative Credit Societies in the United Provinces of Agra and Oudh, in a lecture recently delivered by him at Allahabad, in the course of which he rightly observes: "The most pressing problem of the (Indian) agri-

culturist at the present time is how to carry on his existing business without gradually sinking into a condition of virtual serfdom to the money-lender for himself and his entire family. Once the cultivator is freed from bondage to the money-lender for his current requirements he naturally begins to look about and seek new and improved methods of developing his business."

It is hoped, however, that the gradual spread of education among the masses of our people will, in the long run, do much in training them to imbibe a more correct idea of co-operation; and we doubt not that the various Provincial Co-operative Conferences will do a great deal in devising means for spreading such education and knowledge. In this connection the following lines quoted from the Government of India Resolution No. 12-28-1, dated Simla, the 17th June 1914, is highly significant:—

"Co-operation has been, in the widest sense of the term, education both intellectual and moral. When men are associated for business purposes, they feel the need of education..... Illiteracy is a hindrance to the movement, and just as co-operation leads to a demand for literacy, so literacy leads to a demand for co-operation. The effect of co-operation, however, extends beyond this. It does more than merely produce cheap credit; it encourages thrift..... self-restraint, punctuality, straightforwardness, self-respect, discipline, contentment, and thrift have been encouraged."

"The ideals of the movement," justly observes *The Irish Homestead*, "are freedom and solidarity. Freedom of thought for the individual, liberty to act with or withdraw from the society as he chooses. And solidarity or brotherhood in the organisation which offers to all the advantages of unity and strength." It would thus be apparent even to the most superficial observer, that not only the economic salvation of the country, but, also, to a great extent, the regeneration of the national character of the people, depend not to a small extent upon the spread and development of the Co-operative movement; and we have every reason to hope that the movement so kindly and wisely initiated by the Government of India will receive every encouragement and support of our educated countrymen who seem to be so anxious for the spread of primary education among the masses of our countrymen.

RAICHARAN MUKERJEA.

NOTES

Our Basic Faith.

All joint endeavour for reform, improvement and progress made by bodies of men, giving themselves the name of Convention, Congress, Conference or League, rests on a basic faith. This conscious or subconscious belief is that in this world of ours reform, improvement and progress are possible, nay, certain, and that there is a Something transcending human power and knowledge which makes a favorable response to effort in the right direction. If people did not believe in the possibility and certainty of betterment, if they did not believe in the law of cause and effect, if they did not believe in the Something, call it Power, Person, Oversoul or by any other name, which makes fruition follow right endeavour, either in the life-time of an individual or generation or after a longer period, they would not sacrifice ease, comfort and wealth, nay, even risk their lives and liberties, in the pursuit of an ideal. We believe that this Supreme Person is our friend, protector, inspirer and guide. We are impelled to action, consciously or unconsciously, by our faith in Him and love of Him. It is meet, therefore, that among all the congresses, conferences, and leagues, held during the latter half of December, there should be some to bear witness to this basic and supreme faith. The Indian theistic movement is one of the world movements which stand for a religion of which the central point is this fundamental faith.

The Theistic Conference.

The world requires a religion which is a reconciler between sects professing apparently conflicting faiths, and is con-

sequently a unifier of all. More than any other country does India require such a faith. For she is the meeting ground of more living religions than are to be found in any other country. And by her catholicity and tolerance she is fit, too, to be the preacher of such a faith. The work of reconciliation and unification requires that this religion should be tolerant and also appreciative, in due degree, of all faiths that have in any age or clime helped man to any extent in his upward struggle. The masterly presidential address of the Hon'ble Dr. Nil Ratan Sircar, M.A., M.D., delivered at the last session of the Theistic Conference, printed in this number, shows how the catholicity, tolerance and appreciativeness of the Indian theistic bodies stand this test. Indian theists do not believe that God's revelation, inspiration and guidance have been confined to any particular favoured age, race or clime. He has spoken, still speaks and will continue to speak to men and women of all races, castes, and creeds or no-creeds in all lands. This is but the bare truth: it satisfies our idea of a just and impartial God, and does not humiliate or mortify any race, nation or

HON'BLE DR. NIL RATAN SIRCAR, M.A.

people by excluding them from the circle of "the chosen people of God." The Indian Theistic Movement stands for the ideal of giving opportunities to all, irrespective of sex, race, caste or creed,—opportunities to be and do whatever their powers, manifest and latent, may fit them for. It does not assume any capacity or incapacity in any individual or class. However humble its actual achievement, its aspiration is to hold out the brotherly and sisterly hand of help to the lowly, the fallen, the weak, the depressed, the ignorant and the miserable.

In these and other ways it humbly seeks to fill the place of a *Yugadharma*, or religion which the age requires, but not to the exclusion of other faiths guided by similar principles.

Inter-dependence of Reforms.

All movements for progress are inter-dependent. Individual instances may here and there seem to contradict this statement, but its general truth is beyond question. We have seen how all endeavours for reform rest on the basic truth of religion. As, however, men and women sunk in the depths of ignorance and destitution cannot make much progress in spirituality, their progress in religious ideas and righteous conduct are dependent on progress in knowledge and material advancement. Material advancement, again, depends on progress in knowledge. As a privileged class is never in favour of universal education, the progress of a whole people in knowledge depends on its possession of political power. Economic progress, too, is not possible without the possession of political power. Social reform, also, depends on the possession of civic rights. The fusion of sub-castes and castes can be facilitated by the State recognising intercaste marriages as valid. But this recognition can be secured only by changing the law, which implies the possession by the people of political power. The "lower" castes rightly desire to occupy a higher position in the social scale. The surest means of doing this is for them to educate themselves and improve their material condition. It must also be recognised that that strenuous united effort which must be put forth to secure political power would require greater social unity and solidarity than the people of India at present possess. These and other similar considerations show how every reform is correlated with every other. The various pan-Indian and sectional conferences held during the last fortnight shows that it has been recognised that man's life is not a mechanical aggregate of various separate activities, but that it is an organic whole of which no department, sphere or province is uninfluenced by or without its influence on the others.

Disadvantages of a Crowded Week.

Though man's life is an organic whole, it is not possible for each individual to take equal interest in or devote equal

energy to the solution of religious, social, political, educational, industrial or other problems. According to one's powers and inclinations one should choose one's particular field or fields of activity. But though the workers must specialise, the public should have time to understand the propaganda, plans, methods and ideals of all the different movements. But this is scarcely possible when we find that in the city of Bombay alone twelve bodies held their sessions during the last eight days of December. And there were other conferences held in Bombay and other places during this period or a few days earlier. Even the big dailies prove unequal to the task of printing in full the presidential addresses, not to speak of their other important speeches. And supposing the editors could do so, where is the newspaper reader who could read all this literature even superficially, it being absolutely out of the question to do so attentively and with reflection?

Nor is it possible for the editors to help their readers with careful and succinct summaries of the presidential addresses and other important speeches with comments thereupon. For advance copies of these pronouncements are sometimes not received at all, (that at any rate is our experience), and sometimes received only a day or two previous to the date of a session.

If the presidents were chosen some months in advance, and some, in fact, had been so chosen, and if they could furnish the editors with copies of their addresses at least a week in advance, journalists at any rate could do their part much better than they do now. Still the listening or supposed-to-be-listening public and the far larger reading public could not help being bewildered at the mass of more or less ephemeral literature hurled at their heads in the course of a few days.

The only feasible plan, as has been pointed out by many journalists repeatedly, is to hold the various conferences in different parts of the year. But our public men are for the most part dependent for their leisure on court holidays, and Christmas is the only time when there is a vacation throughout India lasting for more than a week. This accounts for the overcrowding of Christmas week with engagements. But it is better to have some sort of deliberation and demonstration than none at all.

The political platform is the common platform for most educated and public-spirited Indians. The session of the Indian National Congress is therefore *the* function which furnishes occasion for most of the other movements to hold their sessions. But the importance of these latter must not be judged by the subordinate place which circumstances have given them in the public eye.

The Industrial Conference.

India was for ages both an industrial and agricultural country. It is now mainly an agricultural country. Its poverty and the famines which visit some province or other almost every year, are due to a great extent to this fact. If the country is to prosper, the old manufacturing industries of India must, where possible, be revived, and new industries introduced. The object of the Industrial Conference is to devise ways and means for making India an industrial country.

SHIP-BUILDING.

Sir D. M. Petit, chairman of the reception committee of the Bombay session, after giving an idea of the progress of the cotton manufacturing industry of Bombay, went on to observe:

Having said so much about this industry in vain do I look round to see if there is any other in this city worth mentioning. There was, however, one a few generations ago, which, if it had lived and continued till now, would have reached with the growth of prosperity and civilisation of the world, a dimension possibly even greater than the Cotton Industry and might have contributed still more to the greatness of this city. What I am alluding to is the ship-building industry, which, at one time, flourished to such an extent that it was talked about in distant parts of the world. It is more than a pity that this industry was not fostered and looked after but was allowed to come to an end, otherwise it would have been to-day one of the greatest assets not only of this city but most probably of the whole country.

TATA CONCERNS.

This city has also been lately the birthplace of two industrial concerns, of an extent and importance, which has not been surpassed until now, anywhere else in the whole of India. I mean the Tata Hydro-electric Works and the Iron and Steel Company. It is the first time in the history of India that such gigantic works have been started by Indian gentlemen, with Indian capital, and they are to-day an example for future generations to start other industrial concerns.

The history of the death of the Indian ship-building industry deserves to be more widely known than it is. No nation can have flourishing industries and com-

merce which does not possess an adequate merchant marine, as the efforts of Japan in this direction, described in our pages by Mr. Lajpat Rai, show. We ought to direct our energies to the revival of the shipbuilding industry in all maritime provinces.

Sir D. M. Petit agreed with those who want "Government intervention and giving of such help and protection to the industries of the country, as are being given by other foreign Governments and chiefly Japan."

There is no doubt, that such help and such intervention would be of the greatest value for the growth and starting of new industries, to enable them to fight against foreign competition, against concerns much older and therefore much stronger; and any industry in its infancy can hardly hope to fight such competition without Government help and Government support. But while the country is asking for Government intervention on behalf of new industries those who are interested in an industry, which comparatively speaking, is in its youth but not in its infancy, are clamouring for the removal of Government intervention. It may sound paradoxical, but Government intervention in this case, is certainly not in the best interests of this country and the industry concerned. That Government intervention is nothing else but the Excise Duty, a Duty levied on cloth manufactured in our own country, out of cotton grown on our soil and sold in our own markets. Nobody with any sense of justice can with the greatest stretch of imagination consider this duty a fair and equitable one. We know how it was laid, at whose demand, and in whose interest. It indeed disheartens one to a considerable extent when one finds that instead of receiving the fostering care and solicitude at the hands of Government, one has to face and bear a duty of this character.

The speaker was of opinion that

The main difficulty for any one who wishes to start a new industry is that of competing with his foreign competitor, who is much older, better established and stronger than he and consequently can crush him with ease. Therefore, what is the remedy? I find that there is but one remedy which would ensure the success of new industries in this country against their foreign competitors, and that is, fiscal autonomy. Unless this country has got the power of levying duties on foreign imports in a manner that may be best conducive to the support and encouragement of its own manufactures, new industries will find it very difficult and will rarely be able to grow and thrive in this country. Spread of education on a far greater scale, than is at present, the giving of technical instructions in all large cities in the country, the starting of departments of industries where people could go for advice, help and information, are steps which are necessary for the progress and the development of industries in India. If these steps are taken and fiscal autonomy is given in such hands that it could be used in none but the right and proper way, and above all, if co-operation is established on a permanent basis between Government and the people, then with all these, one sees a future in industrial India which would make this land one of the most flourishing, wealthiest and prosperous in the world.

Sir Dorab Tata's Address.

The address of Sir Dorab Tata, president of the Industrial Conference, is entitled to careful consideration because of his experience and the position he occupies in the industrial world.

In his opinion the requisites of an industry are raw material, labour, capital and technical skill or science.

All four are indispensable factors, but if a choice has to be made as to which of them is the most important, personally I would give the palm to technical skill or science. To the eye of the unskilled observer, raw material, labour and capital are merely so much raw material, hands and things. It is only the organising brain that detects the industrial possibilities of assembling these together at a suitable time, place and proportion, as it by intuition.

"The greatest need of the hour is to wed science to industry." "Scientific research needs such large endowments that only the State can provide it."

SIR DORAB TATA

President of the Industrial Conference

Photograph by Messrs. B. G. & Shepherd

When, however, we talk of scientific education let us be quite clear what we mean. It connotes at the top the machinery for higher scientific study, for the creation of that atmosphere of scientific know-

ledge and research which will permeate all our industries. Sir Norman Lockyer once said that the greatest economic asset of Germany was not the possession of a few great scientists; other countries possess as good scientists and as good brains; but the possession of a diffused knowledge of science. We want to build up in India that diffused knowledge of science. Below this we want technical schools to increase the skill of our craftsmen, museums and exhibitions to bring this knowledge home to the people in the most practical and instructive manner namely, ocular demonstration, and universal education in order to produce a higher standard of manual labour.

Sir Dorab told our young men that in industrial concerns every one, European or American, who is filling a position of trust and responsibility, began his career at the very bottom of the ladder. He advised our young men to do likewise and not to be impatient at having to begin at the bottom.

While admitting that industrial education in the widest sense of the term is primarily the function of the state, he said :

I am not one of those who think it is the function of Government to start industries except in those rare cases where their own needs require it. Nor do I think it is the province of Government to finance, in whole or in part, new industries. The main duties of Government are, apart from the domain of education which we have considered, to conduct a scientific survey of the resources of the country; to place full information before the country in the most instructive manner possible; to provide reasonable transport facilities; and to ensure demand by giving to the products of indigenous industry their own custom, and so far as possible that of large public bodies. From this point onwards the initiative must come from the people themselves.

We do not think there is any immutable law fixing the respective shares of the work to be done by the State and the people in the industrial development of a country. Much must depend on the circumstances of a country. And as a matter of fact, we know in Japan (as described in Mr. Lajpat Rai's three articles in this Review on the Evolution of Japan) and some European countries the State has actually done what Sir Dorab says it is not the province of governments to do.

In India Government has hitherto done very little even in the spheres assigned to it by Sir Dorab.

He says as regards Japan :

The result of my inquiries is that no bounty of any sort is paid by the Government on cotton goods coming to India. Not that there are no bounties. Bounties are paid to develop particular markets but not by the Government; they are paid by the Japanese Millowners' Association...but as far as I can ascertain no such bounties are paid even by the Japanese Mill-

owners' Association on any cotton yarn, cloths or hosiery exported to India.

The Amrita Bazar Patrika, however, points out that the new monthly review of trade in Japan, called "Commercial Japan" says that the Japanese Government have decided to subsidise, for a period of ten years, all companies engaged in the manufacture of dyes, chemicals, textiles and other goods. But whether the speaker's information on this point be correct or not, our manufacturers may follow his advice when he says :

What we should do is to find out by a careful study of the facts what the Japanese do to overcome the great disadvantage of having to bring their raw material thousands of miles, and next what they are doing to improve the quality of their output and to meet the taste and requirements of Chinese buyers.

He also advises the manufacturer to give his industry "natural protection" by locating it in consuming centres.

By locating his industry at an inland centre he will be placing himself at a great initial advantage as against Japanese or other foreign glassware that must pay all the haulage to such interior points. But further study of the situation a location will perhaps be found that has the additional advantage of having the right raw material at hand, saving further heavy haulage charges and reducing the cost.

Though a free-trader by education no less than by association, he was not opposed to a moderate protective duty as an integral part of our fiscal system. He referred to the unfairness and oppressive character of the cotton excise duties. His message to the conference was : "Educate, Organise, Co-operate." "Organisation is our weak point."

We must be constantly dinging into the ears of the people the remarkable things that have been achieved in other lands, much less favoured than ours, by the application of science to industry. The application of science to industry reduces, among other things, the disparity arising from muscular development between one race and another, and the advantages of climate. It is in fact a great leveller. But even more than to the ears, our appeal must be to the eyes of the people, because impressions gained through the eye are proverbially more potent than those derived by any other means. I strongly commend to this Conference and all friends of industrial advancement, the great importance and utility of holding exhibitions and starting industrial museums in as many cities as possible, to demonstrate to the public the vast possibilities of a combination of science and industry. More than lectures and more than museums and exhibitions are of course the concrete examples of great industries raised and worked on the soundest lines.

Industrial Conference Resolutions.

Dr. H. H. Mann, Principal of the Agricultural College, moved a resolution earnestly recommending the establishment of a

technological faculty at the principal Indian universities, development of the already existing technical institutions, opening of new ones and gradual introduction of technical instruction in primary and secondary schools. The resolution further appealed to the men of capital and industry to help young Indians technically trained in finding practical work and employment. This was followed by a resolution demanding fiscal autonomy for India. The next resolution trusted that the imperial Government will arrange for India's voice in any treaties which may be arranged between the International Powers so far as Indian fiscal interests were concerned and that at any rate it shall be accorded the most favoured nation treatment. Then followed resolutions urging the repeal of the cotton excise duty, demanding the abolition of the system of indentured labour, and urging the Secretary of State that in placing orders for the Government of India he should give preference to such firms as offered facilities to Indian students for practical training in technology.

On the second day of the proceedings the Conference adopted resolutions recommending (1) to start and revive various minor and cottage industries, (2) appointment of Indian commercial attaches to the principal British consulates to look after Indian commercial interests, urging Government to purchase all their requirements as far as practicable from this country, suggesting to the Government that there should be standing exhibitions of the nature introduced by the Commercial Department at all the presidency towns and important trade centres, and recommending the establishment of industrial banks similar to those found in foreign countries.

Sir Dorab's Confession of Faith.

Sir Dorab concluded his able, suggestive and thought-provoking speech with a "confession of faith." He said :

Every Indian worth his salt must ask himself "How best can I serve my country?" I have chosen the path of industrial development, because I am passionately convinced that it is to our industrial progress that we must look for the future regeneration of India. More even than political rights what every true Indian patriot longs for is the growth of an Indian nationality, firm and united in its love for and honour of the Motherland. The road to that nationality is economic progress.

A country's position in the scale of nations depends chiefly upon its industrial development. For instance, Germany is what she is mainly owing to

the great advance she has made in her iron, chemical and other industries.

But if Germany had been a dependent country like India, would it have been possible for her to make the rapid and phenomenal industrial advance she has made? With the unfair and oppressive cotton excise duty, with railway rates which favour foreign articles, with neglected and undeveloped water-ways, with no mercantile fleet of our own, and in the face of numerous other disadvantages due to our political powerlessness, it is a task of the greatest difficulty for us to make progress in industries.

Nevertheless, though never forgetting that industrial and political progress are mutually dependent on each other, it is self-help on which we must and ought mainly to rely. Weak whining is contemptible. It is for this reason that we like the manly self-reliant tone of Sir Dorab's address, though we think Government ought to do more for the industrial development of the country than what he would expect it to.

Western Industrialism and Our Handicrafts.

Western industrialism can justly boast of its achievements, but it has also been to some extent soul-killing, disruptive of family ties and destructive of home influence, and morally and physically injurious. India has already copied to some extent western industrial methods and organisation, and the prevailing tendency is to go further in this direction alone. Two problems, therefore, face us in consequence. How are we to have industries of the western type without importing at the same time western industrial evils; and, if they be an inevitable accompaniment of such industries, how are we to minimise them? How can injury be prevented to the heads, hearts and bodies of the factory operatives? The second problem is connected with our cottage industries, our small crafts or handicrafts. Owing to the abuse of political power by the East India Company and others and to foreign competition, many of them are dead and most are in a decadent condition. Is it possible to revive and strengthen them? And if so, how can that be done? Cottage industries are undoubtedly far better than big factory industries physically, morally, and socially. They are also more conducive to the development

and conservation of the artistic genius of a people. It is not merely in and by its literature that the soul of a people expresses and nourishes itself. Its arts also serve the same vital purpose; and not merely the fine arts, but the crafts also. The factory operative tends to become a part of the machinery; whereas the craftsman is able to give full play to his intelligence and artistic talent.

These questions ought to receive prominent attention in an industrial conference. As agriculture is our chief industry, it should also receive adequate attention. But in its recent session the Industrial Conference did not pass a single resolution on the essential need of agricultural education for all Indian villages, or on any other question directly connected with agricultural development. The Chairman of the Reception Committee and the President made passing, though emphatic and significant, references to agriculture as "the oldest as well as the largest industry of the country." But they had nothing to say regarding our crafts. And the conference passed only a colourless resolution on the starting and revival of cottage industries.

The First Indian Commercial Congress.

To the uninitiated, to those, that is to say, who stand outside the business world, it might seem superfluous to have a Commercial Congress in addition to the Industrial Conference. But in modern times, business, like many other things, is highly specialised, and there are many divisions and sub-divisions. While industry is concerned mainly with production, commerce is chiefly concerned with the distribution of what is produced, with export and import and exchange. And considering the gigantic proportions which Indian inland and foreign trade has assumed, surely there ought to be a separate organisation to look after our interests in this line.

Speech of Mr. D. E. Wacha.

Mr. D. E. Wacha was fitly elected chairman of the reception committee of the first Indian Commercial Congress. In his speech welcoming the delegates, he carried his hearers back to that dimly lighted past when, as "history informs us on the authority of great historians and travellers who flourished more than 3,000 years ago," India carried on trade "on the one hand with Arabia, Persia, Asia Minor, Syria,

Egypt, and even distant Greece and Rome, and on the other with Java, Borneo, China and Japan." Regarding present times Mr. Wacha observed:

I am strongly of conviction from my study of the history of the world's international trade for the past fifty years that our rulers are on the whole following a policy, though not without some grievous mistakes now and again, which is certain, to lead to the greater material prosperity of the land. We should all try to realise here the remarkable dictum of that great economist, Dudley North, given over two hundred years ago that "The whole world as to trade is but as one nation or people, and therein nations are as persons."

As "commerce cannot exist without agricultural products which could be safely exported to foreign countries after what may be necessary for home consumption," "it should, therefore, be the constant aim and object of this Commercial Congress to stimulate the agricultural (including the breeding of live stock) and mineral prosperity of the land."

Mr. Wacha laid stress on the institution of Agricultural Banks on the lines of the Egyptian Agricultural Bank with such modifications as may be deemed essential. He also spoke of the incalculable advantage of commercial education based on high scientific knowledge of a practical character. He expressed his earnest hope that

Indians of enterprise and commerce will devote specific attention to the incalculable advantages of possessing a mercantile fleet of their own. As you all know the vast sea-borne trade of the country is carried on in foreign bottoms and thus a part of the annual wealth by way of freight inward and outward is carried away by foreign ship-owners. Ship-building is an art not unknown to India, and it is an historical fact that along with a large number of war ships for the British Navy, during the latter part of the eighteenth and almost the whole of the nineteenth century, built in the Bombay Dockyard by those great Parsee master builders, Wadias, merchant vessels were also built of a most durable type. It is much to be wished that this art of ship-building was again revived on a sure and solid foundation which may lead to the greater mercantile prosperity of the country and be also in times of emergency a tower of strength to the Government itself.

Speech of Sir Fazulbhoy Currimbhoy.

Sir Fazulbhoy Currimbhoy, President of the Commercial Congress, delivered an able and informing address. The account which he gave of the dimensions of Indian foreign commerce in the 17th, 18th and 19th centuries will be new to many. He also spoke of India's ancient maritime trade.

Of the gathering over which he presided he rightly observed:

Here is no recognition of racial distinctions but a

unification of all races and interests on a common platform, and in this attempt to establish commercial unity we may perhaps discern the preparation of India for ultimate political unity.

Drawing a comparative picture of India's foreign trade in ancient times and in our day, he said:

She had a large foreign trade and a well-equipped shipping which took her wares even to the most distant regions then known. But large though that trade was it pales into insignificance when we compare it with figures in the trade reports of the present times published by the Government of India, and large though that shipping was, it must have been nothing to the huge tonnage which serves our ports at present. The one regrettable feature is that

SIR FAZULBHOY CURRIMBHOY
President of the Commercial Congress

while the shipping was ours, the present shipping is not our own; and just as we have lost the carrying trade so we can scarcely hope that Bombay will ever regain her former position as one of the great ship-building centres of the world.

The difference pointed out in the last sentence between ancient and modern times is vital and should never be forgotten. India can never attain full commercial prosperity until she has her own merchant vessels.

The paramount necessity of a commercial congress will be understood when we remember that

At both the Wheat and the Cotton Conference the Indian commercial community was completely ignored by Government. Such exclusion of some of the Indian chambers from important discussions of matters relating to Indian trade would have been impossible were all the chambers federated on the lines of the proposed Associated Indian Chamber of Commerce. But the impelling reason for an early session of the Commercial Congress is the paramount need for the speedy formation of an Associated Indian Chamber of Commerce in view of the expected settlement at the close of the war of important issues affecting Indian trade interests.

The *raison d'etre* of the Commercial Congress will be clearer still from the following extract from Sir Fazulbhoy's speech:

Ours is not a self-governing country, and the voice of the people must in any case be united and very strong indeed to influence the policy and action of the authorities. The subjects of a dependency must of necessity be at a serious disadvantage. So long as the Government of a country is not thoroughly national in spirit and sentiment and personnel; so long as it is, from its constitution and the accident of its foreign character, more or less exclusive; with all its benevolent intentions and desire to promote their material welfare, it must to some extent at least be ignorant of the true feelings and the real needs of the people. The difficulty is considerably enhanced when the Government is subject to the powerful influence of the ruling nation, which has sometimes conflicting interests, and an effective industrial and commercial organisation which can make that influence irresistible. It is a matter of common knowledge that the Government of India is powerless to shape its commercial and industrial policy with a sole eye to Indian interests. The British manufacturer and the British merchant, with their votes which they know how to use to the best advantage, are masters of the situation. In the result the Government of India has on many an occasion to adopt a line of action at once repugnant to it and prejudicial to the interest of the people. It has not a free hand, and in fiscal matters is practically helpless. For instance, even for the purposes of revenue customs duties cannot be imposed upon British manufactures along with other manufactures unless counterbalanced by corresponding excise duties, whether the home made articles compete with the imports or not. Again we have lately seen the deplorable sight of a strong British syndicate attempting to get from one of our Provincial Governments a practical monopoly for the manufacture of Cement. It is useless to multiply instances. The outstanding feature of the situation is that the Government of India does not lack the will to take the right course in industrial and commercial matters, but has not the necessary freedom of initiative and action. We the people of this country must therefore do all we can to strengthen its hands, and an Associated Indian Chamber of Commerce with periodical Commercial Congresses should provide the machinery through which we can make our support effective.

Sir Fazulbhoy's demand that India must have fiscal independence, fiscal autonomy, self-government in commerce and industry, leaving complete liberty of action to the Government of India in matters relating to commerce and industry,—will be readily

endorsed by every Indian who has any knowledge of Indian economics.

The President pointed out that we must concentrate all our forces on the question of the customs duties.

In any scheme of additional taxation,—not an unlikely contingency should the War continue some time longer,—the customs will and ought to, have, not only an important, but a predominant position. In every country these duties, bating one or two exceptions, are the most productive sources of revenue. In India, however, this source has been insufficiently tapped. Whether Free Trade or Protection wins in the end, there can be no doubt that a very careful revision of the tariff has become increasingly necessary in view of the financial needs of Government.

His observations on our waterways deserve to be quoted.

The waterways are very inadequately developed; indeed, in certain respects we are losing ground. Channels which were once navigable and which once served as highways for the cheap transport of heavy merchandise have either become completely silted up or choked with weeds and their mouths blocked by bars. The rapid extension of railways has also contributed to the neglect of the watercourses. No serious attempt has yet been made to restore the river systems of the country to their former satisfactory condition. The result is, we have numerous stagnant pools, malaria and other diseases. The natural drainage of the land is thus becoming blocked. The improvement of the rivers and watercourses will not only restore this drainage and facilitate the movement of merchandise, but will provide canals for the purposes of irrigation at a minimum of cost. Larger production of raw materials through improved irrigation will certainly increase our exports at the same time that it will add to the financial resources of the agriculturists and enable them to consume larger quantities of finished articles whether manufactured at home or imported from abroad.

He rightly complained that

Railway rates are at present adjusted in such a way as to be more favourable to foreign articles than to articles which are exchanged as between province and province and district and district.

And that

Railway loans are raised in Great Britain and it is a long standing demand that Railway rupee loans should be thrown open to the Indian people. This is an opportune moment for effecting the great change and affording to the people of India an opportunity to have their share in the railway development of this country, as great Britain will not respond at present to any Indian or Colonial loans, so pressing are our own financial needs.

Commercial Congress Resolutions.

The Commercial Congress adopted a resolution establishing an Associated Indian Chamber of Commerce and another

Urging respectfully that Indian trade and commerce should be given adequate representation on Councils of the Empire and that for this there should be two elected seats in the Imperial Council and at least one elected seat in each of the Provincial Councils.

Among the other resolutions passed were the following:

It is highly expedient in the true interest of Indian Commerce and manufacture, that at any Conference or Conferences to be hereafter held for the purpose of considering and arranging International Commercial treaties the Government of India should be adequately represented thereon.

Government be requested to institute a thorough inquiry into the question of the incidence and comparison of Railway rates and their effects on the trade and commerce of the country, both internal and foreign, with a view to give every facility to the Indian manufactures of cheap transport throughout the country, and that in order to put Indian industries on equal footing with foreign ones, the low rates charged for foreign goods be applied in case of Indian products although the load or the lead may be less than the standard one required.

This Congress urges on the attention of Government the desirability of stimulating and extending well irrigation where it may prove most economical and profitable to the cultivators.

That in order to provide facilities for the transport of goods it is desirable that a complete and uniform system of through communication by water should be provided, wherever practicable, between centres of commercial industrial, or agricultural importance, and between such centres and the sea.

That in the opinion of the Congress the utility of the British Consular Service would be materially enhanced if consular officers were authorised to communicate direct on application, available information sought by accredited British inquiries in foreign countries, instead of being compelled, as at present, to supply such information only through the medium of the Commercial Intelligence Branch of the Board of Trade; the Congress also earnestly recommends the appointment of Indian Commercial attaches to provincial British Consulates.

That having regard to the great advantages resulting from the extensive employment of untaxed Alcohol for industrial purposes and for the generation of powers and the increasing demands for petrol for motor purposes, this Congress is convinced that the retention of the existing duty on Alcohol for such purposes is a very serious obstacle to the progress of the Indian industries and that a letter be addressed to the Government requesting them to exempt, from duty, Alcohol for industrial and power purposes in particular.

Mr. Wacha's Address at the Indian National Congress.

THE NEED OF VIRILITY.

In the course of his address of welcome as chairman of the reception committee of the 30th Indian National Congress Mr. Wacha said:

Virility in a people is as much essential as material prosperity to their orderly and healthy progress. There should be a happy co-ordination of the arts or war and peace. Material prosperity alone is prone to lead to effeminacy or as the poet has said "men decay where wealth accumulates." So too excessive exercise of virility alone is unproductive of prosperity and often leads to stagnation if not arrest of all social progress and welfare. History teaches us that that nation survives the longest which possesses in

itself both the elements of virility and material prosperity in the highest degree. Indeed, Great Britain has herself shown to the world, in this unhappy war, a brilliant instance of what co-ordination of great wealth and material resources with a spirit of virility can achieve. Are we not entitled to say that this co-ordination alone has enabled her to raise the large army of over three millions without any previous compulsory military service. Wealth alone at this hour could not have accomplished this miracle which is the admiration of the world. Side by side with her material prosperity was to be discerned all through that fostering and stimulating of the soldierly spirit in her militia first, in her volunteers next, and lastly, in her territorials. We all devoutly hope that, profiting by this great achievement, Great Britain will not deny any further to the Indian people the exercise of arms, the want of which for so many years, has led to their emasculation.

THE MORLEY-MINTO REFORM.

He aptly characterised the Morley-Minto Reform as "the homeopathic dose of popular reform" and complained of "the nigardliness of the boon" of a slightly "freer discussion of the Budget," which "in no way reflects popular wants and wishes."

Thus, if we consider the principal features of the Morley Minto Reform we find that they are so exceedingly defective and hardly in harmony with the growing popular sentiment and wishes that it is inevitable that sooner or later the defects which presently accompany them will have to be removed.

ROYAL COMMISSIONS.

The mountain of the Decentralization Commission "has laboured to produce a ridiculous mouse." It has been often said of Royal Commissions that

They are generally known to be devices for solving difficult or inconvenient problems. They seldom solve them. Their character has been well typified in the following couplet.

"Promise, pause, prepare, postpone,
And end by letting things alone."

Regarding the Public Service Commission Mr. Wacha observed:

In this matter of the Public Service no finality can ever be reached, be there as many Royal Commissions or other devices, so long as Indians are deliberately balked under various pretexts of their legitimate aspirations and ambitions.

GENESIS OF UNREST.

Regarding the genesis of unrest Mr. Wacha quoted the following observations of James Russell Lowell, the great American scholar, statesman and poet:

"It is only by the instigation of the wrongs of men that what are called the rights of men become turbulent and dangerous. It is then only that they syllogise unwelcome truths. It is not the insurrections of ignorance that are dangerous but the revolts of intelligence. It is only when the reasonable and the practical are denied that men demand the unreasonable

and impracticable, only when the possible is made difficult that they fancy the impossible to be easy."

To British officials, and non-officials, whether here or in England, who are fond of "stand-pattism" may also be commended the following quotation made by Mr. Wacha from Buckle's "History of Civilization."

"Men have recently begun to understand that, in politics, no certain principles having yet been discovered, the first conditions of success are compromise, barter, expediency and concession. It will show utter helplessness even of the ablest rulers, when they try to meet new emergencies by old maxims. It will show the intimate connection between knowledge and liberty; between an increasing civilization and an advancing democracy. It will show that for a 'progressive nation, there is required a progressive polity; that within certain limits, innovation is the solid ground of security; that no institution can withstand the flux and movements of society, unless it not only repairs its structure but also widens its entrance; and that even in a material point of view no country can long remain either prosperous or safe, in which the people are not gradually extending their power, enlarging their privileges, and so to say, incorporating themselves with the functions of the State. Neglect of these truths has entailed the most woeful calamity upon other countries."

Government as Customer.

In his presidential address at the Industrial Conference Sir Dorab Tata said: "Once the right kind of article is produced—of a quality and at a price which will stand comparison with the imported article—the custom of Government is immediately forthcoming." That may be true, at least so far as the experience of great and successful capitalists like Sir Dorab goes. But the question is to what extent, if any, Government help and encouragement are required to bring an industrial concern up to the standard of efficiency when it would be able to produce "the right kind of article." If one is able to produce an article which in price and quality can stand comparison with the imported article, he may even be able to do without Government custom in some cases, as Dr. Johnson was able to do without Lord Chesterfield's patronage of his English dictionary after it had succeeded in gaining popular approval.

Five Hundred Thousand Officially Going Hungry.

In reply to a question asked by the Hon'ble Babu Surendranath Ray in the Bengal Legislative Council, the Hon'ble Mr. Birley replied on behalf of the Government:

The affected area comprises 1,115 square miles out of the total area of Bankura district, which is 2,621 square miles. The population affected is 502,837, the total population of the district being 1,135,670. The classes principally feeling distress are cultivators, weavers, agricultural labourers and beggars. Small tenure holders are also affected.

Private estimates put the number of the famine-stricken people much higher,—something like 8 lakhs. But supposing, as Government says, that about half the district is affected, it is difficult to see why famine should not be declared in the affected area. Government simply says:

Government are aware that considerable and widespread distress prevails in the district of Bankura. Government have adopted such measures as are necessary to meet the situation. Government do not propose to declare a state of famine in the district; this decision not in any way limit the scope of the measures taken for the relief of distress.

No reasons are assigned for Government's decision not "to declare a state of famine in the district"; it is simply added that "this decision does not in any way limit the scope of the measures taken for the relief of distress."

The decision may or may not limit the scope of the measures taken for the relief of distress; but the limits are ruthlessly drawn by the amount of money available for relief measures; and according to Mr. Birley's reply,

Government have sanctioned Rs. 3,75,000 for agricultural and land improvement loans, Rs. 50,000 for gratuitous relief, and Rs. 1,00,000 for relief works in Bankura district.

So Government grants come up to rupees five lakhs and a quarter. Supposing one spends the minimum of 2 pice per head per day on an average to keep alive the famine-stricken people, five lakhs of the sufferers would require five lakhs of rupees per month. The distress made itself felt earlier than September. But supposing the people began to feel the pinch of hunger only from September last, adequate relief measures would have required, during the last four months of 1915, twenty lakhs of rupees; instead of which we have a Government grant of five lakhs and a quarter. And private relief-workers can under no circumstances have spent more than fifty thousand rupees.

It is, therefore, urgently necessary for Government to make more ample grants, and employ a much larger staff of official relief-workers. We do not know whether this will be done. But whether Government do their duty fully or not, we should

Photograph

FAMINE-STRICKEN PEOPLE OF THE DISTRICT OF BANKURA.

not refrain from doing ours. Help will be badly needed for 7 or 8 months more. Principal Mitchell of the Bankura College writes to Dr. D. N. Maitra of the Bengal Social Service League :—

The nights are now bitterly cold, and many are suffering; for their houses are in such a bad state of repair that it is impossible to keep out the cold.

The gathering at the Thana every Sunday is a pathetic one. Many of the doddering old men and women are on the edge of the grave. Some are clamorous but the majority are patient. On Sunday last I noted one feeble very old man. He had to wait over 4 hours for his turn, but never an impatient word did he utter. We rewarded him by giving him an extra seer. It is a touching sight to see the children crawl up to the sacks as the work of distribution proceeds. Little tots of 4 and 5 sit on the ground near the table and scrape up the dust and dirt on the offchance of picking up a few extra grains of the precious food.

I fear our work must continue at least for another 7 months. It is not a bright prospect. At present there is a slight improvement in the condition of the people, for what paddy there is in the 'sole' lands is now being harvested. But the real pinch has to come and we must be prepared to meet it.

There are thousands of poor people in this district

who are now being alive by the noble work Government is doing and the generous help sent to them by you and others. But we need more help. Oh that people could see the sights I witness every Sunday. But help will come. It has come so far most unexpectedly, most generously. Our Father above has heard the cry of the children and aged. He bids us feed the hungry ones. They have a right to live. We, also, have heard the cry. We hear it every day. We are bound to respond.

It should be borne in mind that Bankura is the poorest district in Bengal. This statement is not a random one based on a vague impression or surmise. We make it after looking at the figures relating to the area and revenue demands of all the districts of Bengal. This poor district has few rich men. Hence outside help is very urgently needed.

The Bankura Sammilani, of which the Hon'ble Mr. Justice Digambar Chatterjee is president and the editor of this paper is vice-president and treasurer, has opened relief-centres in Unions Numbered 10 and 11 in Khatra Thana, and Nos. 1, 2, 3 and 4 in Raniband Thana and at village Harh-

masrah in Taldangrah Thana. We gratefully acknowledge elsewhere the contributions received, since our last acknowledgment, and earnestly solicit more help. The giving for which we plead is even the giving in excess of ability. "Most giving is measured by what one has after he has got all his wants satisfied. Rarely does giving spring from self-denial, the real diversion of expenditure from self to others. But this is the only giving which binds the world closer, and yields the finer the best returns. The prevention of waste, the exercise of more careful economy, the omission of easy and needless expenditure, would yield to almost every one a fund for sympathy. To do without things we need in order to supply the greater need of others would keep the fund large, and to many people would open a new world of satisfaction."

Half-fed District Pays 104 Per cent Revenue.

In the Report on the Land Revenue Administration of the Presidency of Bengal for the year 1914-15 it is stated :

"The majority of the people in the Burdwan Division look to agriculture as their principal means of livelihood. The weather conditions during the year were not favourable to agriculturists, as the rains ceased abruptly in September and so the outturn of the crops was below normal. The cultivators were, however, compensated to a certain extent by the high prices of food grains which ruled throughout the year.

In the Appeal for Help issued by the official Bankura District Relief Committee over the signature of the District and Sessions Judge and sometimes signed by the Magistrate and Collector also, who is a member of the Committee, it is written in explanation of the cause of the present famine :

"The distress is the more acute on account of previous bad seasons. In 1913 a large area in the northern portion of the District was devastated by the great Damodar flood. Last year [in 1914] the rains ceased early in September and the yield was very poor in most parts.

Regarding the year 1915, we find in Mr. Birley's reply previously referred to :

The distress in Bankura district is due to short and ill-distributed rain-fall in June, July and August, resulting in damage to the winter rice crop and making transplantation impossible over a large area.

It is officially admitted then that the very poor district of Bankura has had bad luck during three successive years. But this singular misfortune does not seem to

have impaired in the least its revenue-paying power. On the contrary, it appears to have increased its capacity to meet the revenue demands of Government. For such is the machine-like "efficiency" of the administration, that paragraph 58 of the Land Revenue Administration Report for 1914-1915 is able to tell us :

The table in the	margin shows the districts in
Percentage of collections	which collections attained the
which districts	prescribed standard of 100 per
(1) Bank	cent. or more on the current
(2) Bard	demand. Of the remaining dis-
(3) Durg	tricts the percentage was nearly

up to the standard in Malda (99.2), Noakhali (99.2), Hooghly (99.09), Jalpaiguri (99), Chittagong (98.7), Midnapore (97.9), Rajshahi (97.6), Bakarganj (97.5) and Khulna (97.09). In the other 13 districts the decline in the percentage was due mainly to the depression in the jute trade as stated above.

We wonder whether there was exultation instead of "depression" in Bankura owing to successive years of bad luck. It stands at the top of the list of the districts which paid more than cent per cent! The unconcerned spectator may admire the perfection of the wonderful revenue-reaping machine, but those whose limbs may have been caught in its wheels may be pardoned for not entertaining that sort of feeling. They might even mutely appeal to Lord Carmichael or whoever else has the power to heal their wounds and bind up their fractured limbs, and for future years to import a little more of human failings like sympathy into the machine.

Dr. Jivraj N. Mehta.

Dr. Jivraj N. Mehta, who has recently returned to India from London, had a very brilliant career in India at school and as a student of the Bombay Grant Medical College, where he obtained almost all the prizes and scholarships meant for meritorious students. Proceeding to England for higher medical studies as a Tata and Sir Mangaldas Nathubhai Scholar, he joined the London Hospital.

There he successfully obtained the degree of M.R.C.S. and M.A.C.S. and also won a prize in Anatomy. He then passed the first F.R.C.S. and at the early age of 26 stood at the top in the M.D. Examination and was awarded a gold medal finally securing the coveted degree of M.R.C.P.; and for these rare achievements a public dinner was given in his honour at the Hotel Cecil by distinguished Indian residents in London. He was the first Indian after a lapse of nearly a quarter of a century to be appointed a clinical assistant in the various departments of the London Hospital, where he subsequently acted as a pathological assistant, as Assistant Director of clinical laboratory and as an assistant clinical pathologist—all

DR. JIVRAJ N. MEHTA, M.D.

these posts he fulfilled with great ability and credit to himself

The Gujarati tells us that

Side by side with his brilliant University career, both in Bombay and in London, he has strenuously worked in numerous movements of public usefulness and has been an indefatigable champion of the cause of Indian students in the United Kingdom. He has been a General Secretary of the Indian Guild of Science and Technology. He was also for two years President of the London Indian Association. He had the distinction of being a member of the important deputation that waited upon Lord Crewe under the presidency of Sir M. M. Bhownagree for representing the case of Indians in South Africa. After the declaration of war in Europe, he has been an active supporter of the Indian Ambulance Corps and worked zealously with Mr. Gandhi of South African fame. He worked hard in the cause of the Indian Students for admission to the Officer's Training Corps. He was also appointed a member of the British Indian Congress Committee and a member of the Committee of the Indian Social Club in London. In face of poverty and various other difficulties, Dr. Mehta has won brilliant laurels and fought his way up to an eminent position.

India has reason to be proud of students like Dr. Mehta. His success sets one thinking of the reasons why the State does not adequately recognise Indian talent in the medical and sanitary departments.

Reason for not appointing Indians to high posts in the Medical Services.

The late Surgeon-General Harvey's name was a very well-known one in his life-time in this country. As a professor in the Calcutta Medical College and as organizer of the first Medical Congress in this country, one should have expected him to sympathize with the aspirations of Indian medical graduates. But he had not the strength of mind to resist the temptations of the Anglo-Indian bureaucracy and not to fall a victim to their ways of thinking. When more than 15 years back, the question of reforming the medical services of this country was before the British Medical Association, Dr. Harvey, in his capacity as Director-General of Indian Medical Service, opposed the proposal of reform, in a "note" which will hardly commend itself to any fair-minded person. He wrote :

"The principle of *detur digniori* sounds well, and is followed as far as may be by the Indian Government, subject to the limitation that it takes the most worthy of its own officers for its own appointments, and does not throw them open to the world. If it did, it might conceivably get better men for particular appointments, though it is doubtful if the best men in any branch would come to India on speculation for the salaries given."

Of course it is convenient for Dr. Harvey to ignore the existence of competent medical men who are 'natives' of the country. No, *the best men in any branch* need not come to India on speculation. In India itself there are best men available who are competent to teach every branch of the medical profession. Of course, Dr. Harvey writes :

"The service is open to all natives who choose to compete, and it would be most undesirable to open it to men who have never left India, and are ignorant of Western manners and modes of thought."

The first portion of the above sentence, that is, "the service is open to all natives," is a myth. Dr. Harvey has not told us what "Western manners and mode of thought" have to do with one's professional competency. But there are many "natives" who have been trained in the Universities and medical schools of Europe and America and have distinguished themselves by their original work and professional competency who would try to qualify

themselves for the professorships, if these appointments were thrown open to the world. There are many "natives" who have taken the highest academical degrees and diplomas in Medicine and Surgery—not only in India but in Europe and are quite capable of discharging the duties of professors in the Indian Medical Colleges, not only with great credit to themselves but with great benefit to all concerned. Then the great bugbear of Dr. Harvey, namely that "an outsider ignorant of the language and customs of the country would be much handicapped in the competition for practice," would altogether disappear.

But then is it absolutely necessary that those "natives" who have never left their country should not be appointed to high posts in their own country simply because they are ignorant of "western manners" and modes of thought. This is a very dangerous doctrine if followed out in practice. Is not the English education imparted to Indian youths in colleges and schools in India, calculated to train them in the Western manners and modes of thought? Lord Macaulay pleaded for higher education in these terms. "We must do our best to form a class who may be interpreters between us and the millions whom we govern; a class of persons Indian in blood and colour, but English in taste, in opinions, words, and intellect." Dr. Harvey must admit then that the system of education which Macaulay introduced in India and whose efficacy has been borne testimony to by some of the best English statesmen and administrators of India, must have proved a failure if he insists that the professional competency alone of a "native" trained in English is no qualification for his appointment to a high medical appointment in his country, because he has never left India! Do the natives of Australia and Canada leave their own country to qualify themselves for high medical appointments in their own colonies?

That there is a great deal of bias against Indians being appointed to high posts in their own country, every one knew very well. But of Dr. Harvey no one should have expected this. The success of his Medical Congress was mainly due to the "natives" working hard for it. Therefore it pains one to see that he should have in the most public manner cast reflection on the professional ability of an Indian gentleman—a late member of the

Indian Medical Service—whom he says he had twice nominated to the Chair of Materia Medica in the Calcutta Medical College. Dr. Harvey should have explained in what respect his nominee was not a success. In India, an impression prevails that no one can aspire to any professorship in any of the medical colleges in the country unless he is thoroughly Europeanised.

Turning to the Grant Medical College, Bombay, Drs. Parekh and Kirtikar were never confirmed as Professors in that institution and no one ever had the hardihood to even suggest that they were not successes as professors. They were not confirmed because they were "natives."

Sir K. G. Gupta on "Young India" and "Old India."

Some months ago, a contributor writes to *India*, a dinner was given in honour of Dr. Jivraj Mehta, and friends of all races and creeds gathered to congratulate him upon the notable victories he has won for Indians in England in the course of his studies. It will be remembered that when he was to be passed over at the London Hospital for a post he had legitimately won, and simply because of the colour of his skin, he refused to submit to injustice, and eventually triumphed. Since that time he has proved himself able to bear with dignity and credit the responsibility still higher posts have placed on him.

Everyone, says the same writer, who comes into touch with Dr. J. N. Mehta is impressed by his modesty, and when occasions arise which need a strong hand, his force of character often causes surprise. Beneath the quiet demeanour there burns a strong sense of justice, and when it is impelled to action unexpected power becomes manifest.

On the eve of his departure, the members of the London Indian Association gathered at the Caxton Hall to wish him God-speed. Sir K. G. Gupta, in the course of the speech which he made on the occasion, observed:

There is a gulf between young and old: the young think the older men too cautious, and the older men do not like the manners of the young, considering them wanting in respect. It will be better for all when it is recognised that no nation can get on without its old and its young; the gulf between the two ought not to exist, for the years merge one into the other. The young men must be ready to take the places of those, like Mr. Gokhale and Sir P. M.

Mehta, whose work here was done. But he insisted that preparation was necessary; that it was absurd to consider that a young man could suddenly blossom out into a politician to be trusted without studying politics. Just as law, medicine, and science, so politics required long preparation. He urged his hearers to take politics seriously, to study all sides. "When you have done that," he added, "you will find that old men have their uses." He compared the administration of a country to a steamer, saying that the younger generation, strong, fearless, pushing, were as the motive power in the engine room of a steamer; but a steamer guided only by the engine room would soon come to grief; it needed the older men on the bridge to direct its driving power. He referred with pleasure to the friendly co-operation prevailing among Indians in this country; they allowed no difference of creed to interfere with their social intercourse; they knew they were Indians first, and Hindus, Moslems, Parsis, and Christians afterwards. He said that Dr. Mehta was going back to India at a critical period; toleration of differences did not exist there as here, and he begged his young friends to realise that they must not only preserve in India the spirit of toleration and co-operation they had learned here, but endeavour to extend it throughout the various communities. The education of the masses was imperative in the effort to dispel prejudice and bigotry. "As long as we quarrel over a cow or a question of language, we cannot stand united. We must compose our differences, recognise that it is common service which counts that union is strength; till we have learned that lesson, all talk about nationalism is moon-shine."

Sir K. G. Gupta's observations were all to the point. Old or young, we should all have patience with and respect and consideration for one another. That is so far as patriotic men and women are concerned. For the opinions of self-seeking, servile and cowardly youngsters or old fogies no one need care a pin. Nor need one be influenced by the opinions of thoughtless young hot-heads, except so far as it may be necessary to convince them of the error of their ways and bring them back to the path of sanity and duty.

Rebels in South Africa & India.

In the twentieth century there has not been any rebellion in India, not at least of the same kind or magnitude as in South Africa. Indian conspirators or rebels have, however, been punished far more severely than De Wet and his followers. But now even the lighter punishments inflicted upon De Wet and his followers have been remitted, as the following telegrams show:

De Wet and one hundred and eighteen prisoners who had been sentenced for high treason, have been released. De Wet in an interview emphasised the necessity for Anglo-Dutch amity. Discord and past misunderstanding should cease.—"Reuter."

Forty-five prisoners, convicted of high treason are still imprisoned. Their cases will be considered later.—"Reuter."

The release of De Wet and his followers has created a favourable impression in Holland where the British policy of magnanimity is contrasted with the German method.—"Reuter."

Forty-five rebels are still imprisoned in Johannesburg. The conditions on which the others were released include a promise to abstain from politics and public meetings and not to leave their districts without permission until the expiration of their sentences.—"Pioneer" Cable.

Among the reasons why De Wet and his followers have been treated leniently are the facts that the Boers are self-governing and their kinsmen the Dutch in Europe are an independent neutral nation whose good opinion is of some value.

Conspirators and rebels in India ought to be punished. But it is bad statesmanship, if also not something more, to magnify and dignify hairbrained boys, and wicked robbers, be they were boys or older men, into rebels.

What Veteran Teachers Think of our Boys.

Our boys have got a bad reputation with the Anglo-Indian tin-gods, official and non-official. Perhaps Bengali boys are considered the most wicked, and then Deccani and other boys. But their teachers, who ought to know them best do not seem to think so. At the farewell reception given to Dr. J. C. Bose by the students of Presidency college, where he was a professor for the last 31 years, and where the students are almost all Bengalis, in concluding his reply to the Principal James and addresses of the boys, the great professor had something to say about our students.

Turning to the Indian students, he could say that it was his good fortune never to have had the harmonious relation between teacher and pupils in any way ruffled during his long connection with them for more than thirty years. The real secret of success was in trying at times to see things from the student's point of view and to cultivate a sense of humour enabling one to enjoy the splendid self-assurance of youth with a feeling not unmixed with envy. In essential matters, however, one could not wish to meet a better type or one more susceptible to finer appeals to right conduct and duty than Indian students. Their faults were rather of omission than of commission, since in his experience he found that the moment they realised their teacher to be their true friend, they responded instantly, and did not flinch from any test, however severe, laid on them.

That is the testimony of a teacher of world-wide reputation.

The past and present students of Wilson College, Bombay, recently assembled to pay tribute to the work of their principal Dr. Mackichan by presenting his bust to the College. The Doctor has been a teacher

in India for forty years, and has served the Bombay University since 1877 in various capacities as Syndic, Dean and Vice-Chancellor, and has thus had to come into close contact with a large number of Deccani youth. Referring to the bust he said :—

It will serve to remind me continually of those amongst whom I have spent these happy years, of the men and women students whose gratitude has been a minister of continual encouragement, of the graduates who have gone forth from the College to serve their day and generation, whose careers have brought honour to their people, and to the College which was proud to claim them as its *alumni*."

"The Indian student," he said, "is sensitive to a remarkable degree to the sympathy and interest manifested in him by his teachers and his guides."

In speaking of the famine-relief work which Principal Mitchell of Bankura College and his boys are doing, he bears the following testimony to our students :—

We have one distribution day—Sunday. On this day we cycle up to Chhatna, generally about six of us. There is no lack of workers. This responsibility is making men of the students. I am proud of them. They are not only enthusiastic, they are sensible and careful and act cheerfully according to instructions.

Sir. S. P. Sinha's Address.

Sir S. P. Sinha's presidential address at the thirtieth Indian National Congress was a clear and well-reasoned pronouncement, though it was not a great speech, nor one which can be called satisfactory in all its parts from the people's point of view. His praise of the British Government, of British statesmen connected with India, of the British nation and of the Indian Civil Service, would require some qualification. But when all deductions have been made, the address, considering his career and personality, was more significant than any that might have been delivered by Mr. Lajpat Rai or by Mr. B. G. Tilak, had they been called to fill the presidential chair. For, Things-as-they-are, under British rule, has been very propitious to him. He is an eminently successful lawyer. He has obtained wealth, high position and honours. He has been the first Advocate-General in Bengal, and the first Indian member of the Viceroy's Executive Council. He has been in the inner councils of Government, taking part even in forging some of the fetters for the Indian Press. It is clear, then, that the Shoe of British Rule has not pinched Sir S. P. Sinha very hard, whatever the case may be with its other wearers. And what does such a person, favoured by fortune as well as by the British Government,

say? He wants self-government, described by him in the words of Abraham Lincoln as "government of the people, for the people, and *by the people*." True, he says the goal is not yet, but he also says that he refuses "to believe that it is so distant as to render it a mere vision of the imagination," and wants "an authentic and definite proclamation" on the part of Government, that self-government is also their aim, a proclamation "with regard to which there will be no evasion or misunderstanding possible." And he will not be satisfied even with a mere declaration of policy.

What I do say is that there should be a frank and full statement of the policy of Government as regards the future of India, so that hope may come where despair holds sway and faith where doubt spreads its darkening shadow, and that *steps should be taken*

SIR SATYENDRA PRASANNA SINHA,
President of the 30th Indian National Congress.

to move towards self-government by the gradual development of popular control over all departments of Government and by the removal of disabilities and restrictions under which we labour both in our own country and in other parts of the British Empire.

The definite reforms and remedial and progressive measures which he demands are:

Firstly—The grant of commissions in the army and military training for the people.

Secondly—The extension of local self-government.

Thirdly—The development of our commerce, industries and agriculture.

Regarding the first he goes into details as follows:

1st. We ask for the right to enlist in the regular army, irrespective of race or province of origin, but subject only to prescribed tests of physical fitness.

2nd. We ask that the commissioned ranks of the Indian Army should be thrown open to all classes of His Majesty's subjects, subject to fair, reasonable and adequate physical and educational tests, and that a military college or colleges should be established in India where proper military training can be received by those of our countrymen who will leave the good fortune to receive His Majesty's Commission.

3rd. We ask that all classes of His Majesty's subjects should be allowed to join as volunteers, subject of course to such rules and regulations as will ensure proper control and discipline, and

4th. That the mysterious distinctions under the Arms Act should be removed. This has no real connection with the three previous claims, but I deal with it together with the others as all these disabilities are justified on the same ground of political expediency.

He gives very satisfactory reasons why we should have a reasoned ideal of our future. As to the reasons why we should have self-government he said:

A British Premier early in this century very truly observed, "good government cannot be a substitute for self-government." Says a recent writer in a well known British periodical, "Every Englishman is aware that on no account, not if he were to be governed by an angel from heaven, would he surrender that most sacred of all his rights, the right of making his own laws. ... He would not be an Englishman, he would not be able to look English fields and trees in the face, if he had parted with that right. Laws in themselves, have never counted for much. There have been beneficent despots and wise law givers in all ages who have increased the prosperity and probably the contentment and happiness of their subjects but yet their government has not stimulated the moral and intellectual capacity latent in citizenship or fortified its character or enlarged its understanding. There is more hope for the future of mankind in the least and faintest impulse towards self help, self realisation, self-redemption than in any of the laws that Aristotle ever dreamt of." The ideal, therefore, of self-government is one that is not based merely on emotion and sentiment, but on the lessons of history.

He quoted the opinions of some English statesmen, from John Bright to our present Viceroy, to show that ultimate self-government for India has been their ideal, too. As for that matter, an earlier pronouncement, perhaps the earliest, which is a century old, is to be found in the following extract from the *Private Journal* of the Marquis of Hastings:

A time not very remote will arrive when England will on sound principles of policy, wish to relinquish the domination which she has gradually and uninten-

tionally assumed over this country, and from which she cannot at present recede. In that hour it would be the proudest boast and most delightful reflection that she used her sovereignty towards enlightening her temporary subjects, so as to enable the native communities to walk alone in the paths of justice and to maintain with propriety towards her benefactress that commercial intercourse in which she would then find a solid interest.

But the pity is that British proclamations and pronouncements have raised hopes to fulfil which earliest efforts have not yet been made. They have been treated by the bureaucracy as mere scraps of paper. This has been clear to foreigners, too. As Sir S. P. Sinha himself says:

This is what Mr. Chailley says (I am reading from page 188 of the translation by Sir William Meyer): "Had England taken as her motto 'India for the Indians,' had she continued following the ideas of Elphinstone and Malcolm to consider her rule as temporary, she might without inconsistency grant to the national party gradual and increasing concessions which in time would give entire autonomy to the Indians but that is not now her aim." (The italics are mine.) Does any reasonable man imagine that it is possible to satisfy the palpitating hearts of the thousands of young men who to use the classic words of Lord Morley, "leave our universities intoxicated with the ideas of freedom, nationality and self-government," with the comfortless assurance that free institution are the special privilege of the West? Can any one wonder that, many of these young men, who have not the same robust faith in the integrity and benevolence of England as the members of this Congress, should lose heart at the mere suspicion of such a policy, and, driven to despair, conclude that "the roar and scream of confusion and carnage" is better than peace and order without even the distant prospect of freedom? Fifteen years ago, Lord Morley said: "the sacred word 'free' represents, as Englishmen have thought until to-day, the noblest aspiration that can animate the breast of man." Therefore, an Englishman will be the first person to realise and appreciate the great insistent desire in the heart of India, and I say with all the emphasis and earnestness that I can command that if the noble policy of Malcolm and Elphinstone, Canning and Ripon, Bright and Morley, is not steadily, consistently and unflinchingly adhered to, the moderate party amongst us will soon be depleted of all that is fine and noble in human character. For my part, I believe with the fervour of religious conviction that that wise and righteous policy is still the policy of the great English nation.

Should Sir S. P. Sinha's conviction be founded on fact we should be glad indeed. But no proclamation, declaration, promise or pledge can persuade us to believe that his conviction is not a hallucination; we have had enough of them. It is action alone which can produce the same conviction in our minds as in his.

Having formulated the ideal of self-rule, he counselled patience, for "the path is long and devious and we shall have to tread weary steps before we get to the promised

land." We, too, are not in favour of impatience, as manifested in throwing bombs or things of that description. But what we want to say is that Sir S. P. Sinha's counsel of patience was as superfluous as the proverbial carrying of coal to Newcastle. For are we not the most patient people on earth? The French Canadians were conquered by Great Britain after she set foot on Indian soil; they have got self-government. The Boers got self-government *immediately after* being conquered. India was never conquered in that sense; and yet after a century and a half of British rule we are told to patiently wait *even for the beginning of self-rule*. The French Canadians and the Boers being of European descent, they might be thought to have a God-given right to self-rule. But how is it that America granted self-rule to the uncivilised Filipinos within a few years of conquering them, and has promised them independence in a decade or two? We repeat that we are the most patient people on earth. But England has not appreciated our patience, possibly because her own sturdy sons are cast in altogether a different mould, as the history of the methods they adopted to win their rights amply bears out. But it will not do for us to imitate their ways. We shall be patient, but not inactively patient. We must be patiently active to win our birthrights. Sir S. P. Sinha says:—

Let us argue out for ourselves freely and frankly the various ways by which we can obtain the priceless treasure of self-government. It seems to me that it is possible only in one of the three following ways:—

First, by way of a free gift from the British nation.

Second, by wresting it from them.

Third, by means of such progressive improvement in our mental, moral and material condition as will, on the one hand, render us worthy of it and on the other, impossible for our rulers to withhold it.

Now, as to the first. Even if the English nation were willing to make us an immediate free gift of full self-government—and those who differ most from the Congress are the first to deny the existence of such willingness—I take leave to doubt whether the boon would be worth having as such, for it is a commonplace of politics that nations like individuals must grow into freedom and nothing is so baneful in political institutions as their prematurity.

Regarding the first way and the speaker's comments thereupon (which are not without much truth) we desire to draw attention to what Mr. Lajpat Rai wrote about the Evolution of Japan in our last November number:

The Anglo-Indian and British critics of Indian

nationalists are very fond of charging the latter with impatience and of pointing out to them, day in and day out, that Rome was not built in a day; that most of their troubles are due to a want of initiative on the part of the Indians themselves; that representative and democratic institutions are foreign to the genius of the Eastern people; and that it is unreasonable for them to demand what the British have built up after centuries of effort and struggle. We are also very often told that institutions grow from below and can neither be imposed from above nor grafted from without. Many of these statements are at best half-truths, and fallacious. Some are absolutely stupid. This is proved by a study of the growth of institutions in the new world, but even more forcibly is this demonstrated by the development of Japan and the revolution in China.

Japan is an object lesson to those who deprecate the granting of constitutions by sovereigns without agitation, without pressure from the people. She is an example and a successful example of how a Government can educate a people in democratic methods by the grant of democratic institutions. Modern Japan was hardly out of her teens when her monarch decided to give her a constitution and granted her Parliamentary Government.

Japan is a singular example of a democracy being trained by responsibility and trust. It was not a case of first deserve and then desire. It was a case of a father showing his entire confidence in his child and handing him over the reins before he had proved his fitness by the standards set up by Western nations. No education is so effective as that afforded by a position of responsibility.

Of course, it is not feasible to win self-government by an armed conflict with the British power. But we have certainly not exhausted the resources of what is known as constitutional struggle to win self-rule. Rational and moral influence and very great pressure of other kinds may be brought to bear on the British people without using physical force or shedding a drop of blood: Let us think out all the peaceful methods of constitutional struggle which may be necessary to adopt according to changing circumstances, and actively follow them. But it should be remembered, that though we must be firmly resolved not to use any violence, nor to shed anybody's blood, we should ourselves be prepared to undergo every kind of sacrifice and suffering to the uttermost.

Before discussing the third means of attaining the goal of self-government, Sir S. P. Sinha reminded the audience of a parable in Mr. Edwin Bevan's book on "Indian Nationalism."

He likens the condition of our country to that of a man whose whole bodily frame, suffering from severe injuries and grievous lesions, has been put in a steel frame by a skilful surgeon. This renders it necessary for the injured man, as the highest duty to himself, to wait quietly and patiently in splints and bandages—even in a steel frame—until nature resumes her active

processes. The knitting of the bones and the granulation of the flesh require time : perfect quiet and repose, even under the severest pain, is necessary. It will not do to make too great haste to get well. An attempt to walk too soon will only make the matter worse, and above all, the aid of the surgeon is indispensable and it is foolish to grudge the necessary fee.

Quite so. But have we not waited "quietly and patiently in splints and bandages—even in a steel frame," for more than a century and a half, and have we not paid the surgeon's fee more handsomely than any other people on earth? He must be a precious surgeon who would confine the limbs of his patient with splints and bandages until they are atrophied and paralysed or until the poor fellow dies, and who, in order to realise his fee, would keep his patient in perpetual tutelage. It was high time the British Surgeon took off our bandages and allowed us also to manage our property in order to convince us and the world that he was a really capable and conscientious man.

Sir S. P. Sinha proceeded to say :—

We are left, therefore, with the third alternative as the only means of attaining the goal of self-government. When we ourselves have so far advanced under the guidance and protection of England as to be able not only to manage our own domestic affairs, but to secure internal peace and prevent external aggression, I believe that it will be as much the interest as the duty of England to concede the fullest autonomy to India.

But, as regards securing internal peace and preventing external aggression, the speaker himself told his hearers later on :—

There can be no true sense of citizenship where there is no sense of responsibility for the defence of one's own country. "If there is trouble, others will quiet it down. If there is riot, others will subdue it. If there is danger, others will face it. If our country is in peril, others will defend it." When a people feel like this, it indicates that they have got to a stage when all sense of civic responsibility has been crushed out of them, and the system which is responsible for this feeling is inconsistent with the self-respect of normal human beings.

I shall be the first to acknowledge that various steps have been and are being taken by the Government to promote the right spirit of self-help in the country, but I feel that hitherto the Government has not only ignored but has put positive obstacles in the way of the people acquiring or retaining a spirit of national self-help in this the most essential respect.

How then can we advance in any particular direction if, as he says, "positive obstacles" are put in our way?

Regarding the ability to manage our own affairs, we should like to know which nation has acquired that power and learnt that art to perfection, and which has not made and is not still making

serious blunders in managing its affairs. It is responsibility which develops ability. No nation is so unselfish and wise as to be able properly to manage the affairs of other nations. Administrative ability is not a mysterious thing. The nation which in India, under circumstances of great depression, still produces great seers, great poets, great scientists, great fighters, certainly contains thousands of men who can manage the affairs of the country.

The speaker wanted free institutions to be established for the whole of the country,—“not by any sudden or revolutionary change, but by gradual evolution and cautious progress.” There is no charm in the words “gradual” and “cautious” nor need we dread the sound of the words “sudden” or “revolutionary.” Whether one uses the word revolution or not, a radical change there must be, and there must be a point of departure, an instant when Government must break with the past, in however mild a manner, or small a way. And the radical change required is this : Public servants belonging to the I. C. S. or other Services are nominally public servants, they are actually the masters of the people. They make and administer the laws, they levy, collect and spend the taxes, and they give the people as much or as little education and medical help as they think fit. What we want is that public servants should really be servants, carrying out the policy laid down and the laws made by the people, collecting the taxes levied by the people themselves, and spending them in the way laid down by them ; &c. This is a radical change, and this change must be made.

If men like Sir J. D. Rees, who thinks that Gurkha and Sikh sepoys, no matter whether literate or illiterate, drafted into the Indian Civil Service, are sure to make competent magistrates and judges,—if men like him can be the arbiters of India's destiny, surely there are thousands of Indians who are far more competent to make self-government a success in India.

The so-called “lower” castes of Hindus have been told from time immemorial that they can become Brahmans after several births, or even at the next birth, if they lead good lives ; and they have, generation after generation, waited patiently for the good time coming after several births. But,

such is the "impatience"-breeding power of the Time-spirit, even their proverbial patience has been exhausted ; so that many a so-called "low" caste now claims to be twice-born. Our British friends and their followers must excuse us if we do not profess to be satisfied with the vague and indefinite hope of self-government held out for the great-grand-children of the great-grand-children of the great-grand-children of our great-grand-children (though we are afraid even this might be considered much too definite a promise !) : we want something for ourselves within our own life-time. We want to see India enjoying civic freedom before we die.

Time required for Education for Civic Responsibility.

And this is not a preposterous demand or expectation. When a British or an American or a French boy is born, he is not born with the statesman's portfolio or the general's baton. Nor is it solely or mainly heredity which makes him what he becomes when grown-up; for if heredity were so important a factor in the making of men's character and capacity, the sons of most of the poets, generals and statesmen would have become poets, generals and statesmen. It is chiefly by association and education and the bearing of responsibility that the boys of independent nationalities become what they do. Give us and our boys the education and the opportunity, and it is certain that a decade or at the most two decades will find a generation quite ready and able to shoulder any burden. We do not find very big trees in the midst of arid deserts. They are found in the company of other trees equal to or only a little smaller than themselves. Shakespeare was the greatest dramatist among other great dramatists. Lord Roberts was the greatest general among other great generals. Similarly our great poets, our great scientists, the few administrators and judges whom the British Government elevates to high offices, the great Indian captains of industry like Tata, the Indian winners of Victoria Crosses, all these are not rare or accidental products; there are large numbers of other Indian men who are fully their compeers or only a little less gifted than they. And there may be others among the rising generation with even greater gifts and capacities.

For decades the Congress has prayed for commissions in the Army, Simultaneous examination and so forth; are we an inch nearer the goal? It is good to be patient, but it is absurd to preach patience to a proverbially patient people.

Military Careers.

Sir S. P. Sinha's reasons for demanding Commissions in the Army and military training for physically and otherwise qualified persons in all provinces are irrefutable. We will quote one passage.

I take leave to point out, therefore, that it is not correct, at any rate at the present time, to assert of any sections of the Indian people that they are wanting in such physical courage and manly virtues as to render them incapable of bearing arms. But even if it were so, is it not the obvious duty of England so to train them as to remove this incapacity, as they are trying to remove so many others, especially if it be the case, as there is some reason to believe it is, that it is English rule which has brought them to such a pass? England has ruled this country for considerably over 150 years now, and surely it can not be a matter of pride to her at the end of this period that the withdrawal of her rule would mean chaos and anarchy and would leave the country an easy prey to any foreign adventurers. There are some of our critics who never fail to remind us that if the English were to leave the country to-day, we would have to wire to them to come back before they got to Aden. Some even enjoy the grim joke that were the English to withdraw now, there would be neither a rupee nor a virgin left in some parts of the country. I can conceive of no more scathing indictment of the results of British Rule. A superman might gloat over the spectacle of the conquest of might over justice and righteousness, but I am much mistaken if the British nation, fighting now as ever for the cause of justice and freedom and liberty, will consider it as other than discreditable to itself that after nearly two centuries of British Rule, India has been brought to-day to the same emasculated condition as the Britons were in the beginning of the 5th century when the Roman legions left the English shores in order to defend their own country against the Huns, Goths and other barbarian hordes.

The reference to ancient British history in the last sentence ought to prove convincing, if not interesting. The argument is concluded as follows:—

Reason and convenience, justice and necessity, all support every one of the claims I have put forward; and if a definite advance is not made in these respects, it will be difficult to believe that the war has changed the "angle of vision" of our rulers. It will be impossible to retain faith in what was proclaimed by the present Premier "that the Empire rests, not upon the pre-dominance, artificial and superficial, of race or class but upon the loyal affection of free communities built upon the basis of equal rights."

In reading the address, one should never forget, as suggested before that it is not a man having any just or unjust grievance against the British Govern-

ment and people, not a "pestilential agitator," who speaks, but that it is Sir S. P. Sinha, the favourite of fortune, who has been specially favoured and decorated by the British Government. And then it will be clear that he has voiced the irreducible minimum of the immediate and urgent demands of the people of India. Will the Anglo-Indian papers which are praising his address, honestly advocate definitely and earnestly the conceding of those demands?

Prof. Karve's Address.

In the opening paragraphs of his presidential address at the Indian Social Conference, Prof. Dr. D. K. Karve discoursed on the principles and processes of the reform movement. He said:—

We cannot help changing. In spite of ourselves we are not to day what we have been. "Why not then change intelligently?" asks the reformer. It is the privilege of man alone to consciously adjust himself with his surroundings, and all that the reformer does in the case of social life is to consciously probe social evils and devise, as an intelligent being, means to remove them.

There is one prejudice against reform with regard to which Prof. Karve wished to clearly state the reformer's position.

When we ask our brethren and sisters to overhaul social customs and institutions, we are accused of irreverence, of an irreligious spirit. Let me give a flat and emphatic denial to the charge. Far be it from me and from us to lay sacrilegious hands upon the teachings and precepts that are still pulsating with a spiritual life, and that are a perennial source of guidance to frail, tottering man. It is not there that the iconoclastic axe of the reformer is ever laid. He is impatient, as all nature is, of the dead and the effete, which, he, as the representative of the living principle of the race, cannot rest till he has done away with, lest it should rot and putrify and give rise to fatal pestilence. Let no one, therefore, labour under the misconception that reform is an undermining of faith and a violence to the susceptibilities of the religious and righteous. On the other hand faith in the ultimate triumph of Good is the very essence of the spirit of reform. The reform movement, therefore, would not seek to undo that which is the very source of all life and health. It would only seek to bury the dead and clear the ground for all healthy and vital operations of social life.

In the Professor's opinion the greatest need of Indian society at the present day is education. The first thing that we ought to look to is universal education. The social reformer is, however, more closely concerned with the education of women. As has been observed in the Educational Despatch of 1854, by the education of women "a far greater proportional impulse is imparted to the educational and

moral tone of the people than by the education of men." Prof. Karve regretted that Government have not "displayed one-tenth of the activity in the cause of women's education; that they have in that of men's, though even the latter falls immensely short of the needs of the country."

India is proverbially a land of famines. But never was the dearth of material food so sore as that of the food of the mind. Indian children, particularly girls, are starved educationally. It is really very

PROF. D. K. KARVE, E. A.,
President of the Social Conference.

strange that the government of the land should discuss the quality of the food-stuff when the need of the hour demands any edible article just to keep body and soul together. Not an ideally efficient education, but a sort of rough and easy education—that is what is immediately wanted. Let every boy and girl learn the mere rudiments, the three R's, and we shall be content for the present.

He suggested a practical measure for the more rapid spread of girls' education. "We ought to go in for co-education of

boys and girls in the primary schools, at any rate in the lower forms. If girls were admitted to boys' schools for the primary standards, women's education would advance by strides." There can be no objection to the acceptance of this suggestion. But even boys' schools are quite inadequate in number, and the numerical strength of the classes is unalterably fixed by departmental rules.

Vernaculars as Vehicles of Education.

In Professor Karve's opinion "the one defect of the present course of education that is perhaps the most disastrous in its effects is that of the medium of instruction."

It is indeed a very painful anomaly. It has been sapping the energies and undermining the intellectual calibre of our youths all these years. I wonder the educational experts with the Government have not yet seriously noticed it. In the case of boys there are perhaps reasons, other than educational, which may reconcile us to the present state of things, though the evils are but too apparent to a careful observer. These reasons, however, do not exist in the case of girls, most of whom will be called upon to fill the humbler office of the upholder of homes and hearths. The strain involved in receiving instruction through a foreign tongue that tells so severely upon the boys is bound to do greater harm to the girls. We cannot afford to have the future motherhood of the land thus enfeebled and enervated by this extra and uncalled-for strain. We ought to devise a system of education that will ensure all the good of the present course and yet will be free from its evils.

The speaker's idea is based fundamentally upon the recognition of two principles.

(1) That the most natural and therefore efficient medium of instruction is the learner's mother-tongue. (2) And secondly, that women as a class have different functions to fulfil in the social economy from those of men. These two principles will commend themselves to all dispassionate thinkers and have been accepted by educational experts. Whenever the day for the wholesale adoption of vernaculars as media of instruction throughout the whole educational course for boys comes, we ought not to wait for it in the case of girls. There are no political or economic reasons present, and the sooner we begin to impart all education—primary, secondary, higher—to girls through the vernaculars, the better it will be for the race.

Dr. Nil Ratan Sircar also said in his presidential address at the Theistic Conference:—

Another important and closely connected question is the high education of our girls, how far and in what direction the University and high school courses may require to be modified to suit the needs of women and how the physiological drain of public examinations on the adolescent female constitution may be avoided or minimised in the interests of the race. A programme of University Extension for

women with systematic courses of lectures in various subjects in the vernacular followed by examinations and diplomas is one of the practical needs of the hour.

Professor Karve suggested that "in framing these secondary and higher courses of studies," in the vernaculars, "we may be guided by the Japan women's university."

The speaker then made two very welcome announcements. One was that he had been authorised by the managing committee of the Hindu Widow's Home Association to announce that they were prepared to start, by way of an experiment in the direction of higher education through the medium of the vernaculars, college classes as the natural development of their Mahilasrama or Girl's High School. "Already a contribution of no less than ten thousand rupees has been promised by one of my colleagues at the Mahilasrama." The other announcement was that Miss Krishnabai Thakur, at present the Lady Superintendent at the Mahilasrama, had offered a donation of Rs. 4,000 towards the equipment of a small library for the institution.

Prof. Karve concluded his practical and stimulating address with observations showing the need of pushing considerably forward the marriageable age of girls, pointing out how there is an extensive field for useful social work for maidens who choose not to marry and for widows, and directing attention to the condition of the depressed classes.

"Sita and Lakshman."

It is narrated in the Ramayan that when Ram, Sita and Lakshman were in exile in the forest, the *Rakshas* Marich appeared before them in the shape of a golden deer. Sita insisted on having that lovely creature as a pet. So Ram reluctantly went in pursuit of it. Very willy it led him far from their leafy abode in the forest. Unable to catch it alive, he shot an arrow at it, and the *Rakshas* died, crying with a voice imitating that of Ram, "O brother Lakshman, I die!" Hearing this cry, Sita urged Lakshman to go to the help of Ram. Lakshman tried to assure Sita that Ram could not be in danger and that the cry must be the stratagem of some *Rakshas*. But Sita still urged him to go, imputing improper motives for his reluctance. When Lakshman was thus com-

pelled to leave her alone, the *Rakshas* Ravan appeared in the form of a mendicant, and while she was in the act of giving him alms, carried her off. The subject of our frontispiece is Sita taking Lakshman to task.

An Explanation.

We are sorry owing to some irregularity in the delivery or miscarriage of postal articles to or from England, we are unable to publish in the present number the serial we had promised to print, viz., "The Face at the Window" by Mr. Louis Tracy. We shall redeem our promise as soon as "copy" is received from England.

Girls' Education in Boys' Institutions.

Prof. Karve suggested in his presidential address that if girls were admitted in boys' High Schools, the education of girls would be facilitated; and he gave instances of High Schools where girls read in the same class with boys. In provinces, like Bombay and Madras, where no purdah is observed this is a practicable plan: but in Bengal and Bihar and the United Provinces, it is not yet practicable. We are ourselves in favour of it, but there would be opposition from the guardians of the boys and the school authorities, and the guardians of girls, too, would, for obvious reasons, be unwilling to try the experiment.

The Professor also suggests that instead of increasing the number of colleges for women, girls may be sent for higher education to boys' colleges. This would be a practicable plan in provinces where no purdah is observed. In others, too, it may be tried. But if higher education for women is to spread and succeed in the purdah-ridden provinces, there must be separate Colleges for women; for there are few men's Colleges which would admit women students. More than a decade ago a daughter of Dr. P. K. Ray and a daughter of the late Mr. R. N. Ray studied in the Calcutta Presidency College. But when about 5 years ago Dr. Nil Ratan Sircar wanted to place his daughter and his niece there, they were not admitted; they subsequently joined City College.

Classes in boys' colleges are already overcrowded. There can scarcely be any room there for girls.

Prof. Karve's suggestion that there should be more scholarships for girls, we heartily endorse. In fact, whether girls

are to be educated in women's colleges, or in men's colleges with the help of scholarships, what we urge is that both Government and the people should spend as much for the education of girls as for that of boys.

The Home Rule League.

The latest information regarding the proposed Home Rule League, given by the Associated Press, is that at the adjourned meeting of the Home Rule League Conference held at Bombay, Mr. Surendranath Banerjea presiding, Mrs. Besant at the outset made a statement in which she said she would be guided by the elderly members of the Congress Committee and Moslem League members. Mr. Mazharul Haque said that he and his Musalman friends were entirely in favour of forming a Home Rule League. Mr. G. P. Ramsamy proposed an amendment that consideration of the league formation be postponed till the Congress and the Moslem League make their report. Many opposed him, prominently Mr. Jehangir Petit, Dr. Gour and Mr. Rasul. Many Musalmans also were against it. There was a most heated and excited discussion. Mrs. Besant eventually accepted the amendment, which being put to the vote, was carried, nearly 30 representatives of Hindu and Musalman public opinion voting against it.

This means that nothing can be done to form a League before another precious year has passed. And probably at the Lucknow Congress, too, the slackers would muster strong to put off the consideration of the formation of the League for another year, on some pretext or other.

There are some people who seem to think that there is some supreme virtue in delaying. When the war is over, the British Empire constitution is sure to be recast. The Colonies have already made their demands and have their plans ready. But India will be always "cautiously and patiently considering whether a Home Rule League should be established at all." Unbiased foreigners like the late Mr. John Page Hopps, Editor of the *Coming Day*, declared their conviction years ago that Indians were fitter for Home Rule than the Russians were for their Duma; but we are ourselves still unable to believe that we are fit. The poison of subjection has impaired our confidence in

ourselves. We very much require the splendid youthful virtue of self-assurance. We also ought to learn to make up our minds quickly. Time and tide wait for no man.

"There is a tide in the affairs of men,
Which, taken at the flood, leads on to fortune
Omitted, all the voyage of their life
Is bound in shallows and in miseries.

Let those who are in favour of Home Rule work for it incessantly, leaving the extremely wise and extremely cautious and extremely level-headed to deliberate as long as they can.

The Urgent Need of Self-rule.

Many people seem to think that self-government, self-rule, or Home Rule is a mere sentimental need. They do not understand that India's poverty, ill-health and ignorance require *immediately* to be attacked with great vigour and earnestness with a view to their ultimate total removal in as short a time as possible. Under bureaucratic rule, India is the poorest, the most unhealthy and the most ignorant among civilised countries, and her poverty and unhealthiness are not diminishing, and education is spreading at a slower pace than that of the snail. The remedy is Home Rule.

Inter-Caste Dinner.

The all-Hindu inter-caste dinner organised by Hindu reformers with the object of doing away with caste differences was held at Bombay on December 28, 450 guests attending. The dinner was a great success in point of its being attended by members of various castes of the Hindu community from the Bombay Presidency as well as from Madras, Bengal, the Punjab, the United Provinces, Sind and the Central Provinces. Of the eight hundred invitations issued by the organisers, over four hundred were accepted. About 450 sat down to dine, including about 50 ladies. The guests included many ladies and gentlemen of position and culture. There were 125 Brahmins among them and twenty members of the depressed or "untouchable" classes. Sir Narayan Chandavarkar, in the course of an after-dinner speech, said the dinner was for the great purpose of bringing about closer social fellowship between caste-divided members of the Hindu community. Sir Narayan concluded by exhorting all present to have the

courage of their convictions and to be firm against any opposition.

Mahomedan Educational Conference.

At the Bombay Mohamedan Educational Conference held at Poona,

Haji Yusuf Sobani, President of the Reception Committee, delivered his welcome address in Urdu. In the course of his address the Chairman said, so long as the scope of primary education was not widened, the progress of the Mahomedan community was impossible and in order to achieve this object it was necessary that the Government should make primary education not only free, but compulsory. They should congratulate their Hindu fellow-countrymen on receiving the charter of their University. Although the Mahomedans were the first in the field, they had reached the goal before them. But they should remain inactive no longer. It was advisable that they accepted the charter as it was offered. It was said the Mahomedans were disloyal (cries of No No), but this was not the case.

In the course of his address, the President, the Hon. Mr. Justice Abdur Rahim, referred, in dealing with the education of the masses, to Mr. Gokhale's Bill, and observed :—

I am afraid public opinion, which at the time was not very well instructed, did not express itself with sufficient clearness and definiteness. Since then, however, opinion has in this connection grown with remarkable rapidity, so that at the present day there is an universal demand for free and compulsory education. As practical men we do not expect that such a measure can be applied all at once throughout India. But there can be now no difficulty whatever in accepting the principle and enforcing it in selected areas. A commencement might well be made by empowering the Municipalities in larger cities to levy an educational cess for establishing primary education on a free and compulsory basis. I have no doubt that such a measure will be welcomed by all classes of the people and receive their hearty co-operation. While this experiment is carried on in larger cities, the District Municipalities and the Boards should receive ample grants to maintain primary schools in sufficient numbers to meet the want of every town and village. Here I take the opportunity to invite the especial attention of the Government and the Legislative Council of Bombay to the extreme expediency of placing upon the statute book the measure known as the Sindh Paisa Cess Bill, which was introduced as far back as 1907 for promoting popular education among the Muhammadans of Sindh, whose need in this connection is particularly pronounced. The Muhammadan representatives of this Presidency are, I believe, all agreed as to the need for such a measure and the general consensus of Muhammadan opinion is now strong in its support.

We are very glad that both Hindus and Musalmans now want free and compulsory education.

Regarding the establishment of more Universities Mr. Rahim said :—

"Several proposals for establishing additional

Universities at Dacca, Bankipore and Nagpur have been published. What has happened to them? Lord Hardinge has repeatedly announced that there is need for many more Universities in India and, if I may respectfully say so, never was a truer word said. We not only want more Universities but also many more colleges and schools. Otherwise additional Universities will lose half their significance.

Considering the prominent place which the question of a Mahomedan University has occupied in the mind of the community, the President's observations thereupon are worthy of attention.

Now, what have been the community's expectations? You may remember that from the very outset it has been working for an University which should have the power to affiliate colleges other than the Aligarh College, that is, an University based to that extent on the model of the existing Universities. Aligarh was to be the centre and the Aligarh College would have been the principal and for sometime at least the only affiliated college. All the advantages which a residential and teaching University offers would have been available in their fullest measure at Aligarh. They expected that, when other colleges were ready to be affiliated, conditions relating to residence and teaching similar to those that obtained at Aligarh would, as far as possible, be enforced under the supervision and direction of the University. That is the development which the community had before its eyes when the scheme for an University was launched. Such an University would have partaken of the character of a residential and teaching University more than of the merely examining Universities such as the Government Universities. People of all parts of India enthusiastically contributed to this scheme in the expectation of having an University whose jurisdiction might be extended in suitable circumstances beyond the limits of Aligarh. It is largely believed that the expectation was to a great extent encouraged by the Government. However that may be, the reason does not seem to be clear why the Muhamadans or the Hindus when they came forward to establish Universities at their own expense should be told that they were to have a charter, only if they conformed rigidly to the Oxford and Cambridge type and not to the type hitherto recognised by the Indian Government. I can quite understand that beyond certain limits the affiliation of distant colleges may not be desirable: and it is a reasonable matter for consideration how far the jurisdiction of an University which has its centre at Aligarh should extend. I do not see any good ground why negotiations should not take place with the Government on that basis.

As, if a Muslim University be founded at Aligarh, it will mostly serve Upper India, Mr. Rahim, deriving encouragement from the launching of a scheme for a separate University for Mysore, proceeded to suggest the establishment of a University in Hyderabad.

For many years, the Muhamadans of India have been looking towards Hyderabad for a similar movement and I can think of no other measure which would be so well calculated to advance the educational interests of the community in Hyderabad itself and generally in the south and the west. The matter

should be properly and respectfully impressed upon the attention of His Highness the Nizam's Government.

Omissions in Sir S. P. Sinha's Address.

The Congress Presidential address should not be expected to be an encyclopaedia, and any attempt to deal with all public questions can only make it a dull and lengthy conglomeration of unconnected topics. But the President is naturally expected to have something to say on important current topics which have interested and excited the public mind. Two of these are the Indian Civil Service (temporary provisions) Bill and the non-publication of the Report of the Public Services Commission. But Sir S. P. Sinha did not even mention them. The internments according to the provisions of the Defence of India Act, and the various pieces of Press Legislation and their operation should have called forth some comments. Poverty, epidemic diseases and ignorance are always with us. Familiarity has not bred in us any contempt for them. They are the greatest enemies of India. The president of a people's congress should, therefore, have devoted greater attention to these vital questions than is implied in the more or less casual references that he made to them.

Civic Apprenticeship.

What the president of the Congress said on the subject of local self-government is very important.

If ever we attain our goal of Self-Government, it will not be merely through the expansion of Legislative Councils and their powers, nor yet through the admission of more Indians to Executive Councils or the establishment of a national militia, though all of them have no doubt their proper use and importance in the scheme of our national progress. It will come in a very great measure with the advance and development of local self-government. When people generally so far understand their civic rights and duties as to be able to manage their own communal business, their roads and drains, their tanks and wells, their schools and dispensaries, it will no longer be possible to keep them from controlling the higher work of administration. Indeed, it is not always possible to do the latter satisfactorily without having served a full term of apprenticeship in the former, and I cannot do better than remind you of what was said by Mrs. Besant in her address to the Congress last December, while supporting the resolution on self-government: "The training for Self-Government is of vital import to our nation to-day. For the government of states is at once a science and an art; and in order that it may be worthily exercised, the lesson must be learnt in local Self-Government, then in provincial auto-

my, and finally in the Self-Government of the nation, for the work of governing is the most highly skilled profession upon earth..... What then should you do? You should take part in local government wherever it is possible. As it is, take it and practise it, for you will gain experience and you will gain knowledge; and only that experience and knowledge will guide you when you come to speak in larger councils and to make your voice heard over vast areas. So I would plead to you to face this drudgery. It is drudgery, make no mistake; understand the details of local administration and understand how to manage your own affairs, particularly your water-works. Those are the alphabets of self-government; and unless you go through that drudgery, no amount of enthusiasm and love for the country will make your administration a success."

Many of our most prominent men have served this sort of civic apprenticeship, undergone this drudgery. Sir Pherozeshah Mehta, Munshi Gangaprasad Varma, Pandit Madan Mohan Malaviya, Babu Surendranath Banerjea, Babu Ambikacharan Mazumdar, Mr. D. E. Wacha, and many others have strenuously worked and made their mark as well in their respective town councils as in wider fields of work. Younger men ought to follow their example.

The State and Industrial Development.

On the question of what the State ought or ought not to be expected to do to develop the industries of a country, Sir S. P. Sinha had this to say:

The first step taken by Japan was to start factories, either financed by Government or with Government control and managed by experts from abroad. In India alone, with the exception of spasmodic efforts, the Government adheres to the exploded *laissez faire* doctrine that the development of commerce and industry are not within the province of the State.

It is high time that this policy were abandoned. The necessity of carrying on demonstration work in agriculture, the greatest industry of the country, on a commercial scale, is admitted by all, and it is only where this principle has been put into practice that agricultural improvements have been taken up by the people. Similar results will follow if the same policy is pursued with regard to other industries and manufactures. They have followed whenever such experiments have been undertaken by the Government, as in the case of aluminium and chrome-tanning in Madras.

The time is singularly opportune. The War has put an end to the enormous imports of German and Austrian goods and Japan is already making great efforts to capture the trade which by right ought to be ours.

Sir S. P. Sinha on the Enlarged Councils.

Though Sir S. P. Sinha declared that it was his "firm belief that the privileges already acquired, if used with industry and moderation and tact, will in no distant future receive considerable enlargement," he did not leave his hearers in any doubt regarding the real character of the enlarged imperial and provincial legislative councils. He remarked:

Well, it does not require much political acumen to discover that we in India are yet a long way off from free institutions and that the reforms so far effected have not yielded any real power to the people either in the Imperial or in the Provincial Councils.

Revolution in China.

China seems now to be in a very disturbed condition. Yuan-shi-kai, the first president of the Chinese Republic, is said to have consented a few days ago, as the result of voting by representatives of the people, to turn the republic into a monarchy and become the Emperor, the coronation to take place at some suitable future. Whether this was brought about by the manipulation and wire-pulling of Yuan-shi-kai and the monarchists, and, if so, to what extent, cannot be definitely known.

The name is not everything. England is a monarchy and France is a republic. But the French and the English are probably on a par as regards popular liberty. In China Yuan-shi-kai, though styled President of a republic, has wielded almost despotic power. However, in China there seems to be very strong antimonarchical and republican feeling. Hence, it appears, she is on the eve of another revolution.

There is a serious revolutionary movement in China against Yuan-Shih-Kai.—"Reuter."

The military Governor of Yunnan telegraphed to Peking on December 23rd demanding cancellation of the monarchy and execution of its promoters. In a proclamation on the 26th, the Governor declared the Independence of Yunnan.—"Reuter."

A revolutionary leader from Japan says that the other military Governors are expected to join in the revolt which was definitely arranged, a fortnight ago.—"Reuter."

It transpires that the revolutionary movement in China is not confined to Yunnan but has spread to Kwangsi where there is the bitterest anti-monarchist feeling. Prominent revolutionary leaders are hastening to the scene. Yuan-shi-kai has created a crowd of Dukes and other nobles among the Provincial Governors and the Generals, alienating sympathies of powerful personages who have not been so honoured.

(4) SERVOCRACY.

IN the history of India the regime of the Slave Dynasty was not a happy one. In going back to the reign of the servants in my own life's history I can find nothing glorious or cheerful touching the period. There were frequent changes of king, but never a variation in the code of restraints and punishments with which we were afflicted. We, however, had no opportunity at the time for philosophising on the subject; our backs bore as best they could the blows which befell them; and we accepted as one of the laws of the universe that it is for the Big to hurt and for the Small to be hurt. It has taken me a long time to learn the opposite truth that it is the Big who suffer and the Small who cause suffering.

The quarry does not view virtue and vice from the standpoint of the hunter. That is why the alert bird, whose cry warns its fellows before the shot has sped, gets abused as vicious. We howled when we were beaten, which our chastisers did not consider good manners; it was in fact counted sedition against the servocracy. I cannot forget how, in order to effectively suppress such sedition, our heads used to be crammed into the huge water-jars then in use; distasteful, doubtless, was this outcry to those who caused it; moreover, it was likely to have unpleasant consequences.

I now sometimes wonder why such cruel treatment was meted out to us by the servants. I cannot admit that there was on the whole anything in our behaviour or demeanour to have put us beyond the

pale of human kindness. The real reason must have been that the whole of our burden was thrown on the servants, and the whole burden is a thing difficult to bear even for those who are nearest and dearest. If children are only allowed to be children, to run and play about and satisfy their curiosity, it becomes quite simple. Insoluble problems are only created if you try to confine them inside, keep them still or hamper their play. Then does the burden of the child, so lightly borne by its own childishness, fall heavily on the guardian—like that of the horse in the fable which was carried instead of being allowed to trot on its own legs; and though money procured bearers even for such a burden it could not prevent them taking it out of the unlucky beast at every step.

Of most of these tyrants of our childhood I remember only their cuffings and boxings, and nothing more. Only one personality stands out in my memory.

His name was Iswar. He had been a village school-master before. He was a prim, proper and sedately dignified personage. The Earth seemed too earthy for him, with too little water to keep it sufficiently clean; so that he had to be in a constant state of warfare with its chronic soiled state. He would shoot his water-pot into the tank with a lightning movement so as to get his supply from an uncontaminated depth. It was he who, when bathing in the tank, would be continually thrusting away the surface impurities till he took a sudden plunge expecting, as it were, to catch the water unawares. When walking his right arm stood out at an angle from his body, as if, so it seemed to us, he could

not trust the cleanliness even of his own garments. His whole bearing had the appearance of an effort to keep clear of the imperfections which, through unguarded avenues, find entrance into earth, water and air, and into the ways of men. Unfathomable was the depth of his gravity. With head slightly tilted he would mince his carefully selected words in a deep voice. His literary diction would give food for merriment to our elders behind his back, some of his high-flown phrases finding a permanent place in our family repertoire of witticisms. But I doubt whether the expressions he used would sound as remarkable to-day; showing how the literary and spoken languages, which used to be as sky from earth asunder, are now coming nearer each other.

This erstwhile schoolmaster had discovered a way of keeping us quiet in the evenings. Every evening he would gather us round the cracked castor-oil lamp and read out to us stories from the Ramayana and Mahabharata. Some of the other servants would also come and join the audience. The lamp would be throwing huge shadows right up to the beams of the roof, the little house lizards catching insects on the walls, the bats doing a mad dervish dance round and round the verandahs outside, and we listening in silent open-mouthed wonder. I still remember, on the evening we came to the story of Kusha and Lava, and those two valiant lads were threatening to humble to the dust the renown of their father and uncles, how the tense silence of that dimly lighted room was bursting with eager anticipation. It was getting late, our prescribed period of wakefulness was drawing to a close, and yet the denouement was far off. At this critical juncture my father's old follower Kishori came to the rescue, and finished the episode for us, at express speed, to the quick-step of Dasuraya's jingling verses. The impression of the soft slow chant of Krattivasa's * fourteen-syllabled measure was swept clean away and we were left overwhelmed by a flood of rhymes and alliterations.

On some occasions these readings would give rise to shastric discussions, which would at length be settled by the depth of Iswar's wise pronouncements. Though, as

one of the children's servants, his rank in our domestic society was below that of many, yet, as with old Grandfather Bhisma in the Mahabharata, his supremacy would assert itself from his seat below his juniors.

Our grave and reverend servitor had one weakness to which, for the sake of historical accuracy, I feel bound to allude. He used to take opium. This created a craving for rich food. So that when he brought us our morning goblets of milk the forces of attraction in his mind would be greater than those of repulsion. If we gave the least expression to our natural repugnance for this meal, no sense of responsibility for our health could prompt him to press it on us a second time. Iswar also held somewhat narrow views as to our capacity for solid nourishment. We would sit down to our evening repast and a quantity of *luchis* * heaped on a thick round wooden tray would be placed before us. He would begin by gingerly dropping a few on each platter, from a sufficient height to safeguard himself from contamination †—like unwilling favours, wrested from the gods by dint of importunity, did they descend, so dexterously inhospitable was he. Next would come the inquiry whether he should give us any more. I knew the reply which would be most gratifying, and could not bring myself to deprive him by asking for another help. Then again Iswar was entrusted with a daily allowance of money for procuring our afternoon light refreshment. He would ask us every morning what we should like to have. We knew that to mention the cheapest would be accounted the best, so sometimes we ordered a light refecton of puffed rice, and at others an indigestible one of boiled gram or roasted groundnuts. It was evident that Iswar was not as painstakingly punctilious in regard to our diet as with the shastric proprieties.

(5) THE NORMAL SCHOOL.

While at the Oriental Seminary I had discovered a way out of the degradation of being a mere pupil. I had started a class of my own in a corner of our verandah. The wooden bars of the railing were my pupils, and I would act the schoolmaster, cane in hand, seated on a chair in front of

* A kind of crisp unsweetened pancake taken like bread along with the other courses.

† Food while being eaten, and utensils or anything else touched by the hand engaged in conveying food to the mouth, are considered ceremonially unclean.

* There are innumerable renderings of the Ramayana in the Indian languages.

them. I had decided which were the good boys and which the bad—nay, further, I could distinguish clearly the quiet from the naughty, the clever from the stupid. The bad rails had suffered so much from my constant caning that they must have longed to give up the ghost had they been alive. And the more scarred they got with my strokes the worse they angered me, till I knew not how to punish them enough. None remain to bear witness to-day how tremendously I tyrannised over that poor dumb class of mine. My wooden pupils have since been replaced by cast iron railings, nor have any of the new generation taken up their education in the same way—they could never have made the same impression.

I have since realised how much easier it is to acquire the manner than the matter. Without an effort had I assimilated all the impatience, the short temper, the partiality and the injustice displayed by my teachers to the exclusion of the rest of their teaching. My only consolation is that I had not the power of venting these barbarities on any sentient creature. Nevertheless the difference between my wooden pupils and those of the Seminary did not prevent my psychology from being identical with that of its schoolmasters.

I could not have been long at the Oriental Seminary, for I was still of tender age when I joined the Normal School. The only one of its features which I remember is that before the classes began all the boys had to sit in a row in the gallery and go through some kind of singing or chanting of verses—evidently an attempt at introducing an element of cheerfulness into the daily routine. Unfortunately the words were English and the tune quite as foreign, so that we had not the faintest notion what sort of incantation we were practising; neither did the meaningless monotony of the performance tend to make us cheerful. This failed to disturb the serene self-satisfaction of the school authorities at having provided such a treat; they deemed it superfluous to inquire into the practical effect of their bounty; they would probably have counted it a crime for the boys not to be dutifully happy. Anyhow they rested content with taking the song as they found it, words and all, from the self-same English book which had furnished the theory. The language into which this English resolved itself in our mouths cannot but be

edifying to philologists. I can recall only one line:

Kallokee pullokee singill mellaling mellaling mellaling.

After much thought I have been able to guess at the original of a part of it. Of what words *kallokee* is the transformation still baffles me. The rest I think was:

... full of glee, singing merrily, merrily, merrily!

As my memories of the Normal School emerge from haziness and become clearer they are not the least sweet in any particular. Had I been able to associate with the other boys, the woes of learning might not have seemed so intolerable. But that turned out to be impossible—so nasty were most of the boys in their manners and habits. So, in the intervals of the classes, I would go up to the second storey and while away the time sitting near a window overlooking the street. I would count: one year—two years—three years—; wondering how many such would have to be got through like this.

Of the teachers I remember only one, whose language was so foul that, out of sheer contempt for him, I steadily refused to answer any one of his questions. Thus I sat silent throughout the year at the bottom of his class, and while the rest of the class was busy I would be left alone to attempt the solution of many an intricate problem. One of these, I remember, on which I used to cogitate profoundly, was how to defeat an enemy without having arms. My preoccupation with this question, amidst the hum of the boys reciting their lessons, comes back to me even now. If I could properly train up a number of dogs, tigers and other ferocious beasts, and put a few lines of these on the field of battle, that, I thought, would serve very well as an inspiring prelude. With our personal prowess let loose thereafter, victory should by no means be out of reach. And, as the picture of this wonderfully simple strategy waxed vivid in my imagination, the victory of my side became assured beyond doubt. While work had not yet come into my life I always found it easy to devise short cuts to achievement; since I have been working I find that what is hard is hard indeed, and what is difficult remains difficult. This, of course, is less comforting; but nowhere near so bad as the discomfort of trying to take shortcuts.

When at length a year of that class

had passed, we were examined in Bengali by Pandit Mañhusudan Vachaspati. I got the largest number of marks of all the boys. The teacher complained to the school authorities that there had been favouritism in my case. So I was examined a second time, with the superintendent of the school seated beside the examiner. This time, also, I got a top place.

(6) VERIFICATION.

I could not have been more than eight years old at the time. Jyoti, a son of a niece of my father's, was considerably older than I. He had just gained an entrance into English Literature, and would recite Hamlet's soliloquy with great gusto. Why he should have taken it into his head to get a child, as I was, to write poetry I cannot tell. One afternoon he sent for me to his room, and asked me to try and make up a verse; with which he explained to me the construction of the *payar* metre of fourteen syllables.

I had up to then only seen poems in printed books—no mistakes penned through, no sign to the eye of doubt or trouble or any human weakness. I could not have dared even to imagine that any effort of mine could produce such poetry. One day a thief had been caught in our house. Overpowered by curiosity, yet in fear and trembling, I ventured to the spot to take a peep at him. I found he was just an ordinary man! And when he was somewhat roughly handled by our doorkeeper I felt a great pity. I had a similar experience with poetry. When, after stringing together a few words at my own sweet will, I found them turned into a *payar* verse I felt I had no illusions left about the glories of poetising. So when poor Poetry is mishandled, even now I feel as unhappy as I did about the thief. Many a time have I been moved to pity and yet unable to restrain impatient hands itching for the assault. Thieves have scarcely suffered so much, and from so many.

The first feeling of awe once overcome there was no holding me back. I managed to get hold of a blue-paper manuscript book by the favour of one of the officers of our estate. With my own hands I ruled it with pencil lines, at not very regular intervals, and thereon I began to write verses in a large childish scrawl.

Like a young deer which butts here, there and everywhere with its newly sprouting horns, I made myself a nuisance with my

budding poetry. More so my elder* brother, whose pride in my performance impelled him to hunt about the house for an audience. I recollect how, as the pair of us, one day, were coming out of the estate offices on the ground floor, after a conquering expedition against the officers, we came across the editor of "The National Paper," Nabagopal Mitter, who had just stepped into the house. My brother tackled him without further ado: "Look here, Nabagopal Babu! won't you listen to a poem which Rabi has written?" The reading forthwith followed. My works had not as yet become voluminous. The poet could carry all his effusions about in his pockets. I was writer, printer and publisher, all in one; my brother, as advertiser, being my only colleague. I had composed some verses on The Lotus which I recited to Nabagopal Babu then and there, at the foot of the stairs, in a voice pitched as high as my enthusiasm. "Well done!" said he with a smile. "But what is a *dwirepha*?" How I had got hold of this word I do not remember. The ordinary name would have fitted the metre quite as well. But this was the one word in the whole poem on which I had pinned my hopes. It had doubtless duly impressed our officers. But curiously enough Nabagopal Babu did not succumb to it—on the contrary he smiled! He could not be an understanding man, I felt sure. I never read poetry to him again. I have since added many years to my age but have not been able to improve upon my test of what does or does not constitute understanding in my hearer. However Nabagopal Babu might smile, the word *dwirepha*, like a bee drunk with honey, stuck to its place, unmoved.

(7) VARIOUS LEARNING.

One of the teachers of the Normal School also gave us private lessons at home. His body was lean, his features dry, his voice sharp. He looked like a cane incarnate. His hours were from six to half-past-nine in the morning. With him our reading ranged from popular literary and science readers in Bengali to the epic of Meghnad-vadha. My third brother was very keen on imparting to us a variety of knowledge. So at home we had to go through much

* The writer is the youngest of seven brothers. The sixth brother is here meant.

† Obsolete word meaning bee.

more than what was required by the school course. We had to get up before dawn and, clad in loin-cloths, begin with a bout or two with a blind wrestler. Without a pause we donned our tunics on our dusty bodies, and started on our courses of literature, mathematics, geography and history. On our return from school our drawing and gymnastic masters would be ready for us. In the evening Aghore Babu came for our English lessons. It was only after nine that we were free.

On Sunday morning we had singing lessons with Vishnu. Then, almost every Sunday, came Sitanath Datta to give us demonstrations in physical science. The last were of great interest to me. I remember distinctly the feeling of wonder which filled me when he put some water, with sawdust in it, on the fire in a glass vessel, and showed us how the lightened hot water came up, and the cold water went down and how finally the water began to boil. I also felt a great elation the day I learnt that water is a separable part of milk, and that milk thickens when boiled because the water frees itself as vapour from the connexion. Sunday did not feel Sunday-like unless Sitanath Babu turned up.

There was also an hour when we would be told all about human bones by a pupil of the Campbell Medical School, for which purpose a skeleton, with the bones fastened together by wires was hung up in our schoolroom. And finally, time was also found for Pandit Heramba Tatwaratna to come and get us to learn by rote rules of Sanscrit grammar. I am not sure which of them, the names of the bones or the *sutras* of the Grammarian, were more jaw-breaking. I think the latter took the palm.

We began to learn English after we had made considerable progress in learning through the medium of Bengali. Aghore Babu, our English tutor, was attending the Medical College, so he came to teach us in the evening. Books tell us that the discovery of fire was one of the biggest discoveries of man. I do not wish to dispute this. But I cannot help feeling how fortunate the little birds are that their parents cannot light lamps of an evening. They have their language lessons early in the morning and you must have noticed how gleefully they learn them. Of course we

must not forget that they do not have to learn the English language! •

The health of this medical-student tutor of ours was so good that even the fervent and united wishes of his three pupils were not enough to cause his absence even for a day. Only once was he laid up with a broken head when on the occasion of a fight between the Indian and Eurasian students of the Medical College a chair was thrown at him. It was a regrettable occurrence; nevertheless we had not been able to take it as a personal sorrow, and his recovery somehow seemed to us needlessly swift.

It is evening. The rain is pouring in lance-like showers. Our lane is under knee-deep water. The tank has overflowed into the garden, and the bushy tops of the Bael trees are seen standing out over the waters. Our whole being, on this delightful rainy evening, is radiating rapture like the Kadamba flower its fragrant spikes. The time for the arrival of our tutor is over by just a few minutes. Yet there is no certainty. . . . We are sitting on the verandah overlooking the lane watching and watching with a piteous gaze. All of a sudden, with a great big thump, our hearts seem to fall down in a swoon. The familiar black umbrella has turned the corner undefeated even by such weather! Could it not be somebody else? It certainly could not! In the wide wide world there might be found another, his equal in pertinacity, but never in this little lane of ours.

Looking back on his period as a whole, I cannot say that Aghore Babu was a hard man. He did not rule us with a rod. Even his rebukes did not amount to scoldings. But whatever may have been his personal merits, his time was evening, and his subject *English*! I am certain that even an angel would have seemed a veritable messenger of Yamaf to any Bengali boy if he came to him at the end of his miserable day at school, and lighted a dimly dim lamp to teach him English. How well do I remember the day our tutor tried to impress on us the attractiveness of the English language. With this object he recited to us with great unction some lines—prose or poetry we could not tell—out of an English book. It had a most unlooked for

* The Lane, a blind one, leads at right angles to the front verandah, from the public main road to the grounds round the house.

† God of Death

effect on us. We laughed so immoderately that he had to dismiss us for that evening. He must have realised that he held no easy brief that to put us to pronounce in his favour would be a contest ranging over years.

Ashore Babu would sometimes try to bring the zephyr of outside knowledge to play on the arid routine of our schoolroom. One day he brought a paper parcel out of his pocket and said: "I'll show you today a wonderful piece of work of the Creator." With this he untied the paper wrapping and, producing a portion of the vocal organs of a human being, proceeded to expound the marvels of its mechanism. I can still call to mind the shock this gave me at the time. I had always thought the whole man spoke—had never even imagined that the act of speech could be viewed in this detached way. However wonderful the mechanism of a part may be, it is certainly less so than the whole man. Not that I put it to myself in so many words, but that was the cause of my dismay. It was perhaps because the tutor had lost sight of this truth that the pupil could not respond to the enthusiasm with which he was discoursing on the subject. Another day he took us to the dissecting room of the Medical College. The body of an old woman was stretched on the table. This did not disturb me so much. But an amputated leg which was lying on the floor upset me altogether. To view man in this fragmentary way seemed to me so horrid, so absurd that I could not get rid of the impression of that dark, unmeaning leg for many a day.

After getting through Peary Sarkar's first and second English readers we entered

upon McCulloch's Course of Reading. Our bodies were weary at the end of the day, our minds yearning for the inner apartments, the book was black and thick with difficult words, and the subject matter could hardly have been more inviting, for in those days Mother Saraswati's* maternal tenderness was not in evidence. Children's books were not full of pictures then as they are now. Moreover, at the gateway of every reading lesson stood sentinel an array of words, with separated syllables, and forbidding accent marks like fixed bayonets, barring the way to the infant mind. I had repeatedly attacked their serried ranks in vain. Our tutor would try to shame us by recounting the exploits of some other brilliant pupil of his. We felt duly ashamed, and also not well disposed towards that other pupil, but this did not help to dispell the darkness which clung to that black volume.

Providence, out of pity for mankind, has instilled a specific charm into all tedious things. No sooner did our English lessons begin than our heads began to nod. Sprinkling water into our eyes, or taking a run round the verandahs, were palliatives which had no lasting effect. If by any chance my eldest brother happened to be passing that way, and caught a glimpse of our sleep-tormented condition, we would get let off for the rest of the evening. It did not take our drowsiness another moment to get completely cured.

THE HINDU CONCEPT OF GOVERNMENT

BY DR. SUDHINDRA BOSE, M.A., Ph.D.,
LECTURER ON POLITICAL SCIENCE IN THE STATE UNIVERSITY OF IOWA.

WILLING to discover in the early records of India genealogies of kings, accounts of wars, and chronicles of conquest and plunder, European historians have sometimes criticised the ancient Hindus as lacking in historical sense. Indeed, they have gone so far as to declare

that the people of India are without ancient history.* That these modern critics are essentially materialistic in their views is

Sir Monier Williams is convinced of the "absence of all history in India" because, forsooth, there is no "narrative of common occurrences."—See his *Modern India and the Indians*, p. 205.

evident; for their conception seems to be based on the notion that history, to be worthy of the name, must be made up chiefly of the titles and dates of rulers, accounts of their dynasties, and records of their changing fortunes of war. Thus, they quite overlook the fact that the ancient history of India, unlike that of any other nation of similar antiquity, is essentially spiritual. This history has never concerned itself specially with so-called "historical events," but gives, instead, information about the religion, the laws, and the customs of the Indo-Aryans. It reflects the development of mind, the progress of culture, and the advancement of knowledge. In a word, it is a story of what has been most important in the actual life of the Hindu people; and its sources are the treasure-trove of Indian literature.

The history of the Indo Aryans begins with their settlement on the banks of the Indus in the province of the Panjab. Though the date of their colonization is impossible of exact determination, it has been variously estimated at between 2000 and 1400 B.C. Moreover, modern researches seem to indicate that these early settlers were once a branch of the great Aryan family,* and that their ancestors once had a common religion,† a common tongue,‡ and a common home in the table-lands of Central Asia.§ When the Aryans came to India they brought with them a civilization of their own, which is clearly reflected in the *Vedas*, the *Ramayana*, the *Mahabharata*, and other ancient writings. From these sources we learn that the Panjab Aryans were chiefly agriculturalists and that they called themselves *Arya*,—a word which comes from a Sanskrit root meaning plough. They knew something of the arts of weaving and carpentry, and they used metals, such as gold, silver, and iron. That they were acquainted with the use of

weapons is evidenced by the fact that swords, helmets, armours, and arrows are mentioned frequently in their ancient literature. "Architecture too had made some advance, and there are allusions to 'mansions with a thousand pillars'".* Ships and chariots were also familiar objects referred to by the composers of early hymns.

With the progress of time the simplicity of Aryan life gave place to a more complex and more elaborate system of civilization. But this civilization was not material: on the contrary, it was essentially intellectual and deeply spiritual. To enter upon a discussion of the various phases of this culture is beyond the scope of the present inquiry—suffice it to say that "there is scarcely any problem in the science of ontology, psychology, metaphysics, logic, or grammar, which the Indian sages have not sounded as deeply, and discussed as elaborately, as the Greeks."‡ Here we are more intimately concerned with those aspects of Indian civilization which bear upon the methods of administration. And since it has been claimed that "the fundamental principle of all Hindu polity is the division of castes,"§ we shall at once begin with an investigation of the caste system as preliminary to a study of the Hindu concept of government.

The early Aryans of the Panjab were total strangers to caste.§ They were a homogeneous people. They had the same aims and purposes in life. They did not require that division of labor which later became the central factor in the caste system. But as time passed, the Aryans increased in number, spread over a larger area, and came into collision with the dark-skinned aborigines known as Dasyus. A host of new problems now confronted the conquering Aryans. Society had grown larger and more complex: it had outgrown its simpler laws; its numerous functions could only be carried on by a proper distribution of labour. Moreover, the conquered aborigines had become a menace to the Hindu civilization. Hindu society must be kept pure from non-Aryan influences, and at the same time the

non-Aryan peoples must be given sufficient protection.* How could this two-fold purpose be best accomplished?

When the Europeans, in comparatively modern time, colonized America and Australasia, they faced the same problem which confronted the early Aryan settlers in Hindustan hundreds of years before. The policy pursued by the European colonizers led to the gradual extinction of the native population. The Indo-Aryans, on the contrary, appear to have been more humane and just in their treatment of the original inhabitants of India. They did not believe in extermination; they endeavoured to preserve, civilize, Hinduize, and absorb the conquered peoples. To be sure their methods of assimilation sowed the seeds of caste; but whatever may be said of the caste system, it had at least one saving grace: it provided a place for the conquered people in the social scheme of the conquering race.

Caste emphasized the interdependence of social groups. It showed that the Vaisyas (cultivators), though by nature excellent farmers, could not successfully devote themselves to agriculture if their land was not protected against the inroads of the enemy by the Kshatriyas (military men). In the same way it was made clear that religion, the chief factor in a man's life, could not be taught by any and every person. Only those who are "inwardly still," who had gone through severe asceticism, practised self-renunciation, and lived holy lives, were fit to minister unto the souls of others. These spiritual teachers, in order that they might fully consecrate themselves to God's work, unhampered by worldly affairs, were to be supported by the community. They were Brahmins. Thus the three classes, Kshatriyas, Vaisyas, and Brahmins,—represented three great interests; that is, the military, the agricultural, and the religious. There was still need of a fourth class to attend to domestic service; and those who performed this necessary work were known as Sudras. They were mostly the aborigines who had not the power to assimilate the higher elements of the Aryan culture. They were not slaves; they simply occupied the lowest rung of the social ladder. †

* Nivedita's *The Web of Indian Life*, p. 134.

† "The condition of a Sudra, in the Hindu system, was infinitely preferable to that of the helot, the

This four-fold division of the Hindu society was based on *gunas* and *karmas* (qualities and actions). * Each caste (or class, to be more accurate) was formed for the sole purpose of discharging the function for which it had special talent, and each was dependent upon and fired with zeal to serve the other. Thus the caste system in India was simply a logical method of dividing labor with the object of securing a maximum of social efficiency and responsibility with a minimum of social friction.

Caste rules in the early days, unlike what they are at present, were liberal and elastic, admitting of free social intercourse. For instance, intermarriage and interdining were permitted and practised. There was even frequent passage from one caste to another. The Sudras often rose to the ranks of the Brahmins, and the Brahmins were as often degenerated into the Sudras.

The form of government known to the early Aryan Hindus was, of course, monarchical; and the ancient writers often used bold figures to describe the authority of the king. Manu himself describes the chief magistrate as one of the incarnations of the gods. ‡ But this statement, in view of the many restrictions which he laid upon the power of the king, cannot be regarded as anything more than a mere poetic figure introduced to suggest high authority and antiquity. We are no more justified in looking upon the Hindu king as an incarnation of divinity than upon the English king, who calls himself the "Lord's anointed". What the lawgiver sought in calling the king an eight-fold incarnation of the gods was "to idealize into the form of an allegory, the old standard of the rights and duties of kingship". §

The king was by no means a lawless slave, or the serf of the Greek, the Roman, and the feudal systems. He was independent, his services were optional; they were not agricultural, but domestic and personal, and claimed adequate compensation". Wilson, note in Mill's *The History of British India*, Vol. I, p. 136.

* The whole philosophy of caste as it was has been summed up by the *Gita*, in the sentence *guna karma bibhagasah* (distinguished according to character and occupation) and by the *Mahabharat* in *karmabhibarnam gatam* (divided into various castes according to occupation).

‡ *Laws of Manu*, V. 96.

§ *The Modern Review*, January, 1910, p. 63,

despot. In the *Mahabharat* we are told that

"One becometh a king in order that he may uphold righteousness, and not that he may conduct himself capriciously. The king is the protector of the world, O Mandhata! If he act righteously he attaineth to the honors of a veritable God upon earth. But if he act unrighteously, he sinketh into hell. All creatures rest upon righteousness; and righteousness, in turn, resteth upon the king. That king alone is a true king who upholds righteousness. If he fail to chastise unrighteousness, the Devas (gods) desert his mansions, and he incurreth obloquy among men."*

Manu is no less emphatic on this point, saying that "he (the king) shall zealously and carefully protect his subjects." "The protection of subjects is the cream of kingly duties." "That king, indeed, is ever worthy of honor who ensures the safety (of his subjects)." Again, "a king who does not afford protection, (yet) takes his share in kind, his taxes, toll, and duties, daily presents and fines, will (after death) soon sink into hell."

The king was enjoined in the discharge of his public duties to be guided by a capable ministry. "Let him appoint seven or eight ministers whose ancestors have been royal servants, who are versed in the sciences, heroes, skilled in the use of weapons and descended from (noble) families, and who have been tried."† A learned Brahman was at the head of the ministry, and the King was required not to act without the advice of the Prime Minister. It is significant that the description of the court of King Dasarath, as given in the *Ramayana*, is in strict conformity with the composition of a court laid down by Manu.

"The courtiers of the son of Ikshvaku were richly endowed with good qualities, intelligent, and faithfully devoted to the interests of their royal master. Eight virtuous ministers directed the affairs of the government. The two priests made choice of by him were the illustrious Vasishtha and Vamadeva. To them were added other inferior councillors to the number of six. With these holy sages were associated the ancient priests of the king, discreet, submissive, profoundly skilled in law, and masters of their desires. With the assistance and counsel of such advisers Raja Dasarath governed his kingdom."‡

The *Mahabharat* gives the following well-known description of the ministry:

"Four pure and clever Brahmins well-read in the Vedas, having their teachings fresh in mind; eight strong and armed Kshattariyas; twenty-one Vai-

shyas; three mild and pious Sudras, regular in their daily prayers; and one truly qualified Suta, well-read in the Puranas—these should be engaged as Ministers. The ministers should be of the age of fifty, clever, void of jealousy and avarice, well-read in the Shrutis and Smritis (there were three Shudras among them), humble, impartial, capable of settling disputes, and not addicted to hunting, gambling, and the kindred vices. Of these Ministers, the King himself should deliberate with a subcommittee of eight Ministers and settle rules. Then these rules should be proclaimed in the kingdom, and shown to all citizens. By such means you should always look after the well-being of your subjects."

*As a rule the eldest son succeeded to the throne of the father, and on the failure of the issue the king could adopt a son. The successor was expected to be worthy of the great trust imposed on him, and his succession must be approved by the people. The ancient Hindu literature abounds in instances where the claims of the eldest son were set aside because he lacked kingly qualities and because there was popular opposition to his rules. Yayati disregarded the claims of his eldest sons and chose Puru, the youngest, as his successor, on the ground that Puru was by far the best-fitted man for royal office. The fate of Asamanja was equally tragic. He was driven of the kingdom by his father Sagara because he was an oppressor of the people. Again, when king Dasarath wanted to install his son Rama upon the throne of Ajodhya, he asked for the approval of his subjects. They with their leaders first counselled together, then advised the king to "speedily install thy son, endowed with noble qualities, resembling the God of gods, ever intent upon the welfare of the whole state."

The Hindu books constantly refer to the king as *Dharmavata*r (justice in the flesh). His chief duty was to dispense justice "according to principles drawn from local usages and from the Institutes of the sacred law."* If the king did not wish to try the suits himself, he appointed a learned Brahman to take his place. *Sukra-niti* says:

"If a king cannot decide, he should appoint a man learned in the Vedas, of good family, self-controlled, impartial, pleasing, firm, afraid of the next world, calm, and acting to dharma. If a learned Brahmin could not be obtained, then a Kshatriya should be appointed, or a Vaisya who knows the dharma science, but the Sudra should be avoided with care."†

Thus it will be seen that it was not the Brahman class alone, but the Ksha-

* *Mahabharat*, Santi Parva, XC.

† *Sukra-niti*, IV, Sec. 5, 43.

triya and Vaisya also who were eligible to serve as judges.

Manu gives detailed rules to guide the procedure of the court. Whatever may be the sins of omissions or commissions of which our latter-day jurists may accuse Manu, certainly they cannot charge him with hair-splitting in legal procedure. Professor Buhler is right when he says that Manu "pays more attention to the moral side of the duties incumbent on the judge and other persons concerned, than the technicalities."* Again and again the judges are urged to render just decisions.

"But where justice, wounded by injustice, approaches, and the judges do not extract the dart, there (they also) are wounded (by the dart of injustice)."

"Where justice is destroyed by injustice, or truth by falsehood, while the judges look on, there they shall also be destroyed."†

Manu also gives elaborate laws on evidence. He points out who are qualified to be witnesses and who are not. He provides punishment for those who refuse to give evidence as well as those who bear false witness.‡

It should also be borne in mind that the Hindu King was not regarded as above the law. Neither was he a law-giver. "Law," says Sankar, "is the King of kings, far more powerful than they." The king had little opportunity to play the tyrant as far as the law was concerned: for the law was made by the Brahmanic leaders of the community and was interpreted by the Brahmins. To be sure the king was charged with the execution of the law; but he administered it with the assistance of legal counsellors. Moreover, the Brahmins exercised great control over the arbitrary powers of the king. They frequently undertook to depose kings who took the law into their own hands.§ Manu indicates that the misgovernment of a tyrant king not only constitutes a default of the ruler's title, but even a forfeit of his life. "That king who through

folly rashly oppresses his kingdom, (will), together with his relatives, ere long be deprived of his life and of his kingdom."** Thus it is clear that though the ancient form of government in India was monarchical, the rulers were limited, in the exercise of their power, the king occupying the position of one who reigned rather than ruled.

The principal source of the king's income was taxation and the royal domain. The taxes, moreover, were moderate, the ratio of taxation varying according to the value of the property taxed. On an average the taxes seem to run from one-tenth to one-sixth of the produce. As most of the taxes were paid in kind and were proportionate to the produce, they worked little hardship on the persons taxed. In lean years when there was no crop there was no tax.

No one who reflects for a moment on the laws of taxation, and upon the other underlying principles of administration already referred to, will fail to be impressed with the fact that the Hindus had a very well developed system of government between fifteen hundred and two thousand years ago.† Nor were the laws which are found in the ancient books were "paper laws"; they were enforced both in letter and in spirit. The early foreign travellers such as Megasthenes, Fa Hian, Hsuen Tsang, and others, who visited India from the fourth century B. C. to seventeenth century A. D. have eloquently described India as a country where the people were law-abiding, peaceful, and happy. The records of these ancient historians show that India was prosperous under the Hindu kings; that justice was impartially administered; that the people were God-fearing; and that the taxes were equitably levied. These accounts, it should be observed, do not tally with the pictures of poverty, injustice, and oppression so often unjustly associated with the rule of the Hindu rajas by certain modern European writers on government.

It is, of course, not my intention to maintain the thesis that government in ancient India was a model of what constitutes good government. The wonder is that the system of administration could

really be brought to such an advanced state in those primitive times. The ancient government of India may appear very crude to us; but we must not forget the changed character of the times in which we are now living. The phenomenon which goes by the name of the modern state is after all of very recent growth. Professor Bluntschli dates its birth from the year seventeen hundred and forty.*

Perhaps the most significant fact concerning the ancient government of India is the discovery that in the village community there existed the true germs of the representative principle. Now the village community of India was an autonomous institution. "The Indian village or township," says Monier-Williams, "meaning thereby not merely a collection of houses forming a village or town, but a division of territory, perhaps three or four miles or more in extent, with its careful distribution of fixed occupations for the common good, with its intertwining and interdependence of individual, family and common interests, with its provisions for political independence and autonomy, is the original type, the first germ, of all divisions of rural and civic society in mediæval and modern Europe. It has existed almost unaltered since the description of its organization in Manu's code."†

According to the account given by Manu, each village was an administrative unit. An officer, appointed by the king, was placed over each village; and under him the Village Panchayat (Council of Five) attended to the administration of the village. The officers of one village reported to the officers of ten villages, forming a district. The area gradually became larger and wider. The officers of ten villages reported to the officers of twenty; and the officers of twenty to officers of a hundred; and they in turn to the officers of a thousand.‡ The mutual subordination of the officers of the general government served as a check upon their powers.§ They were, however, mere tax-collectors.||

Each village was then a self-governing community; and its members were practically free and independent. They voiced their wishes and opinions directly or through their representatives, forming the Panchayat. The only important tie which existed between the central government and the village community was to be found in the tax paid by the village to the national government.

In his Minutes of 1830, Sir Charles Metcalfe (once a member of the Governor-General's Council, and afterwards Acting Governor-General of India) thus speaks in favor of the village communities: •

"The Village Communities are little republics, having nearly everything that they want within themselves, and almost independent of any foreign relations. They seem to last where nothing else lasts. Dynasty after dynasty tumbles down; revolution succeeds to revolution; Hindu, Pathan, Moghal, Maharatta, Sikh, English, are masters in turn; but the village communities remain the same. In times of trouble they arm and fortify themselves; a hostile army passes through the country; the village community collect their cattle within their walls, and let the enemy pass unprovoked. If plunder and devastation be directed against themselves and the force employed be irresistible, they flee to friendly villages at a distance, but when the storm has passed over they return and resume their occupations. If a country remain for a series of years the scene of continued pillage and massacre, so that the village cannot be inhabited, the scattered villagers nevertheless return whenever the power of peaceable possession revives. A generation may pass away, but the succeeding generation will return. The sons will take the places of their fathers, the same site for the village, the same position for the houses, the same lands, will be re-occupied by the descendants of those who were driven out when the village was depopulated; and it is not a trifling matter that will drive them out, for they will often maintain their post through times of disturbance and convulsion, and acquire strength sufficient to resist pillage and oppression with success."

These "little republics" which have existed down through all ages are now rapidly becoming a thing of the past. The Indian people who have had such immemorial training in self-government are now being practically denied their inherent rights in this ancient institution. The enforced disappearance of village communities is mainly due to two causes: first, the centralization of authority in the

thousand of these villages, that means no more than they were responsible for the collection of taxes, and generally for the good behaviour of these villages. And when, in later times, we hear of circle of eighty-four villages, the so called Chourasees, and of the three hundred and sixty villages, this too seems to refer to fiscal arrangements only.—Max Muller's *India: What Can It Teach Us?* Lecture II, p. 64.

|| "When we read in the *Laws of Manu* of officers appointed to rule over ten, twenty, a hundred, or a

English courts, with the consequent withdrawal of powers from the village community; second, the desire of the English rulers for increased revenue, which is being satisfied by making direct settlements with individual tenants instead of a collective settlement with each village community.*

Dutt's Economic History of India, p. 120.

Of all the great losses which India has suffered from English domination, "the virtual extinction of the old forms of self-government, and the disappearance of those ancient village communities of which India was the first home among all countries of the earth" is undoubtedly the most deplorable.

Iowa City.
U. S. A.

JUVENILE OFFENDERS

WE propose to give here a short sketch of the arrangements which exist in western countries for juvenile offenders.

It is needless to say that with the increase of interest in Social Sciences all civilized countries have adopted special measures and organised special institutions for the treatment of youthful offenders, whether actual or potential. In most of the countries these measures were taken during the first half of the nineteenth century and in one country, viz., the Netherlands, refuges called "Godshuizen" were founded as early as the 14th century, for the care and shelter of 'neglected youth and indigent old age.' The general features characterising all these institutions are the same, viz., the segregation of youthful offenders from hardened criminals, more humane treatment of juveniles than is offered to the ordinary convict, industrial and moral education, and the predominance of private influence and enterprise over state interference.

It would be sufficient for our purposes to notice at some length the arrangements which exist in England and in the United States of America, it being remembered that in the latter country the subject has been more thoroughly dealt with than anywhere else, and that it has actually set the example to England. The institutions existing in Germany are also deserving of notice as having largely influenced English opinion on the matter. Some other countries will only come in for a passing notice.

The United States owed her first reformatory to the efforts of the great

American philanthropist Edward Livingston. Established in 1825, the institution still continues in its new home in Randall's Island near New York. There are now reformatories in almost all the states of the union, but those at New York and Massachusetts have attracted worldwide attention, both on account of the high standard they have set before themselves as well as for the elaboration of means adopted to reclaim juvenile adults. It is these which deserve special notice.

The state reformatory at Elmira, New York, came into existence in 1889 and was established with the avowed object of compassing the reformation of the criminal by psychological treatment as it were. The principle on which it was worked, was that crime should be attacked in its beginning by other than punitive and prison methods. It was held that the youthful offender was more sinned against than sinning and his crime was due largely to inherited defects and to insalubrious surroundings. Society, therefore, had no business to punish him; he had a claim to be differently treated. Society puts him in a prison and after a hard and mechanical treatment lets him off, no better, and possibly worse, than before. Where was the utility of such treatment? On the contrary, it was the duty of society to regenerate him, to change his nature, improve his physique, and give him a new mental equipment, so that when again at large he might be better able to take care of himself, to earn his living by reputable means and not go back into crime again. These are the principles on which the

great institutions of Elmira, and of Concord in Massachusetts are run. They are like boarding schools in their treatment of the inmates. The education, thorough and carried far, includes languages, music, science and industrial art; diet is plentiful and luxurious, amusements and varied recreation are permitted. There is a well stocked library and a newspaper is conducted by the inmates.

The care taken to reform youths of criminal tendencies, however, goes much further. The minimum period of detention is one year, after which an inmate may be let off on parole, but on an average a period of 22 months is necessary to enable the authorities to complete the treatment. The sentence there is indefinite and not a fixed term as in India. Consequently the treatment can have its course. At his discharge the inmate finds work with good wages ready for him. Reports issued by the manager of Elmira claim that 81% of those on parole have done well. The authorities lay a great stress on the principle that physical degeneracy lies at the bottom of the criminal character and great attention is paid to the development of nervous energy and to the strengthening of the normal functions of the body. So much for adult youths.

There is a similar institution for women at Sherborne, Mass., for women with sentences of more than a year. The majority of women in this institution are convicted of drunkenness, an offence seriously noticed in this state, the ordinary sentence being 2 years. Women convicted of other offences are also sent here by courts with a view to their reform. Thus of the 352 inmates, there were 200 convicted of drunkenness, 63 of offences against chastity and 30 of larceny.

There is yet another remarkable institution at Freeville, New York, known as the "George Junior Republic." It is Utopian in its ideals, but the details are strictly carried out. It has its own laws, legislature, courts and administration, and everything is in the hands of the "citizens." The place has an atmosphere of its own, and children whose antecedents have been hopeless, were known to have developed a strong and independent character after residence here.

Let us now turn to the English system. In olden days the main idea in England was to use the same penal methods for all

criminals, young and old. Boys and girls laughed at imprisonment and there were striplings of 13 and 14 who had been committed ten, twelve, sixteen or seventeen times. The evil assumed such huge proportions that in London alone 200 "flash houses" frequented by 6,000 boys, trained and proficient in thieving and depredation, could be found.

It was due to the protests of Charles Dickens, as every reader of "Oliver Twist" will know, that England realised the situation and the first Reformatory School Act was passed in 1854. Earlier attempts to check the evil had no doubt been made but they proved quite insufficient to meet the evils, so much so that in the year 1854 no less than 14,000 juveniles passed through the prisons, 46% of whom had been committed more than once.

The Reformatory School Act (1854) substituted the school for the gaol and all judicial benches were empowered to send delinquents to schools when they had been guilty of acts punishable by short imprisonment, the limit of which was at first fourteen and became afterwards ten days. There was, however, a serious flaw in the Act inasmuch as it provided that a short period of imprisonment in gaol must precede reception into the reformatory. This was opposed by more enlightened opinion as inflicting an indelible prison taint on the youths and was done away with in the act of 1899.

Existing reformatories or "Senior Home Office Schools," as they are called, numbered 44 in 1907 and receive all juvenile offenders up to the age of sixteen who have been convicted of an offence punishable with penal servitude or imprisonment. The number of inmates in 1906 was 5586 and must be deemed highly satisfactory when compared with the figures of 1894.

The measures so far adopted, however, left out of account the large number of adolescents between the ages of 17 and 21 who supply about half the number of habitual criminals. The treatment could only be applicable to youths under sixteen as this was the age of criminal majority in England.

This led to the foundation of the Borstal Scheme which borrowed its principles from the great American institutions of Elmira and Concord. A penal establishment under state control, which was a half-way house between the prison and

the reformatory school, was started at Borstal in 1902. A selection was made of juvenile adults sentenced to not less than six months.

"They were divided on arrival into three separate classes, penal, ordinary, special, with promotion by good conduct and industry from the lowest to the highest, in which they enjoyed distinctive privileges. The general system, educational and disciplinary, was intelligent and governed by common sense. Instruction, both manual and educational, was well suited to the recipients; the first embraced field work, market gardening, and a knowledge of useful handicrafts: the second was elementary but sound, aided by well chosen libraries and brightened by the privilege of evening association to play harmless but interesting games. Physical development was guaranteed by gymnastics and regular exercises."

The result was striking. Youths who were 'rough untrained cubs' when they came, soon improved in demeanor and left the prison on the high road to regeneration. Private agencies, however, contribute not a little to the permanent reformation of these youths, by their efforts to find work, etc., for them, when they come out of the prison. The Borstal Association, founded under the patronage of distinguished persons in English public life, has done specially good work in this connection. Experience showed that although originally offenders committed to only six months' imprisonment were eligible for Borstal treatment, thoroughly good results could only be achieved with sentences of a year's duration. The limit has thus been gradually raised and now all adults between 16 and 21, whether convicted to penal servitude or to imprisonment, are admitted.

The Borstal system however did not bring within its scope the class of young criminals who were sentenced to terms of ten days and under for trifling offences. These young offenders, once having had the fear of prison taken away, were found to come back again and again. The Prevention of Crime Act of 1908 remedied this defect in the law and now the Court has power to pass sentence of detention in a Borstal institution for a term of not less than one year nor more than three on those between the ages of sixteen and twenty-one, who by reason of criminal habits or tendencies or association with persons of bad character require such instruction and discipline as appear most conducive to their reformation. The establishment of other Borstal institutions is authorised by the Act, while a very useful provision is the power to

release on licence if there is a reasonable probability that the offender will abstain from crime and lead a useful and industrious life. The licence is issued on condition that he is placed under the supervision or authority of some society or persons willing to take charge of him.

This does not complete the list of measures or of institutions which exist in England for the welfare of offending youth. There is also a class of institutions for the reformation of potential criminals meant to strike at the very root of juvenile criminality. These are the industrial schools. They were founded on the principle that those who had a tendency to lapse into evil ways could be kept on the right path by proper preventive treatment. Consequently in 1856 the Industrial Schools Act was passed but was applied at first to Scotland only. Next year it was extended to England. There were 45 schools in the beginning but in 1907 there were 102 in England and Wales and 31 in Scotland.

These industrial schools are, again, of two sorts, the truant schools and the day industrial schools. The provisions of the Education Act of 1871 and 1876 led to a large increase in the number of children committed for breaches of the law and to the establishment of these two kinds of schools. The truant school is self-explanatory, and the day industrial school is a school where children do not reside but receive their meals, their elementary education and a certain amount of industrial training. The total admission of truant schools in 1907 were 1368 boys and the number actually in the schools on the last day of the year was 1125 with 2568 on licence. The total number who attended the day schools in 1907 was 1951 boys and 1232 girls.

There are certain institutions in France and Germany which should come in for a short notice.

A remarkable institution is the French colony at Mettray. It was founded by M. Demetz, a judge, who aghast at the evils inflicted upon children whom he was compelled by law to imprison, founded a small colony in 1840 called the "Société Paternelle." The motto of the Society was "the moralization of youth by the cultivation of the soil." Gardening, vine dressing, the raising of stock and the breeding of silkworms are the principal employment of the

inmates. The directors keep their charges so fully employed that they are quite tired when they go to bed and have no time to chat or romp about in the dormitory. Many colonies have been founded on this model. In France, the very young, viz., those under 12 years of age, are placed out in the country with families unless they can be again entrusted to their parents or committed to *Maisons Paternelles* containing 20 or 30 with a large staff.

In Germany there are many kinds of correctional institutions. Many private persons have also devoted themselves to the work and a most remarkable institution is the one founded by Dr. Wickern, called the Raube Haus near Hamburg. From a single cottage it has grown into a hamlet of twenty houses, each house having between 12 to 16 inmates. A marked feature of the institution is the number of 'brothers,' young men of good character who qualify for rescue work as superintendents of homes, prison officers and schoolmasters. They keep in touch with the inmates day and night, eat with them, sleep in their dormitories, direct their labour, accompany them to chapel, join in their recreations and sports. The instruction given in trades, in farming operations, gardening and fruit-raising.

This completes our survey of the arrangements which exist in the principal Western countries for the reformation of juvenile offenders. It now remains for us to consider how far they are instructive to us.

One thing stares us in the face at the very outset. It is the paucity of institutions of any kind whatsoever which can undertake the reformation of our erring youths. All the provincial governments have no doubt one reformatory school each in their respective jurisdictions. Some of the provinces have a juvenile jail for adults between the ages of 17-21, but we are not certain that all have one. But when we compare our needs, and our population is some index of our needs, with what we have got, we have to hang our heads in shame.

Compare the cases of England and Bengal. England has a population of about 42 millions, Bengal has 45, and hence the comparison would be a very apt one. In England, we have seen, there were 44 reformatories and 102 industrial schools, besides the reformatory at Borstal which is also a big institution, in the year 1907.

The figures for 1914 are not available but there can be no doubt that they would be higher than those of 1907.

On the other hand what do we find in Bengal? We find that for the whole presidency and the province of Bihar and Orissa there is one reformatory at Hazaribagh and there is a juvenile jail at Alipore which does not accommodate more than 300 at the outside. This shows how grossly negligent the Government have been in the care of the growing manhood of the nation. The injustice will be all the more apparent when we compare the number of boys (juveniles) treated and discharged by the various English institutions with those which received similar treatment here in Bengal. During the three years of 1904, 1905 and 1906, 3573 boys and 480 girls were placed out by the various English reformatories, of whom about 80% found regular employment.

During the same period again, the Industrial Schools had placed out about 8909 boys and 2505 girls, of whom about 87% found regular employment.

We have yet to show what the Borstal Jail did in this direction. It placed out and discharged 12,482 juveniles during the period of three years referred to above and about 50% of them are reported to have done well.

If we strike a total we find that 24,964 juveniles had been treated and discharged from the various institutions in England during the three years of 1905, 1906, and 1907.

Let us now look at Bengal. The Jail Administration Report for 1914 shows that during the year 750 juveniles were received in the Juvenile Jail at Alipore and 665 were discharged. It also shows that during the year 112 youthful offenders under the age of 15 were received under the Reformatory Schools Act, 1897. We have no figures to show the number of juveniles under 15 who were discharged during the year. Consequently we can add up the figures showing the number received during the year to form some idea of the activity in this line. We find that 862 juveniles in all were received by the two institutions in Bengal during the year 1914.

Now compare these figures with the figures for England already quoted divided by three. And what a striking difference!

It may be argued that criminality is not

so rampant in Bengal as in England. Apart from the soundness or otherwise of this proposition, I say there is much room for improvement even if it be accepted to be true. I know from personal knowledge how shabbily youngsters who are brought to court are treated in India. I give a specific instance. Two boys aged 12 and 14 were hauled up by the police on a charge of theft. The boys had stolen some iron lathes from the Ry. Godown and sold them to a smith. Now it was evident from the evidence that the boys were practically waifs, and in all probability they had been thieving this from before. But the magistrate sentenced them to whipping. They were of course whipped and let off to pursue their career of thieving unobstructed as before. This was done in a provincial capital under the very nose of the government.

This is not a solitary instance either. Anybody who is conversant with the working of the Indian Courts will bear testimony to the fact that juvenile offenders in India are more sinned against than sinning. It cannot therefore be said that in India there is no need for more institutions on the lines of the English reformatories and Industrial Schools.

In comparing the cases of England and Bengal I have not mentioned the recent arrangements made in Calcutta for the trial and detention of juvenile offenders. These institutions are at present rarely a year old, though fraught with great possibilities.

It would be doing injustice to ourselves if we did not refer to non-official efforts in India in this connection. It is no doubt a

sad comment on the public spirit of educated India that while most of the best managed institutions of Europe and America had their origin in and are being run by non-official enterprise, in India there should be none at all of their kind. I know only of one in Calcutta, viz., The Refuge in Bow Bazar Street, which is only a refuge for the waif and stray but is capable of being developed under proper guidance into one of the institutions of the type to be found in Germany or France.

I shall now close with another suggestion. Some non-official member of the Imperial Legislative Council should interest himself in the treatment of juvenile offenders in India and should introduce a bill on the lines of the Prevention of Crimes Act (1908) of England. The Courts could then do away with short sentences on juvenile and adult offenders, and could send them to a house of reformation for a period sufficient to mend them. The American method of *indefinite sentences* is obviously unsuited for India where the governing body is not drawn entirely from the people.

Another thing in which the non-official member may interest himself is the arrangements which at present exist in the various juvenile jails in India for imparting industrial and other education to the boys and girls who are confined there. The proposed Jails Commission has been indefinitely postponed and it now entirely depends on us whether we shall remain where we are in the matter of jail administration.

B. CHATTERJI.

THE NOTION OF KINGSHIP IN THE SHUKRANITI

(Compared with the notion prevailing in contemporary Europe.)

BY R. G. PRADHAN, B.A., LL.B., M.R.A.S.

THE subject of political thought and institutions in Ancient India still awaits the investigation of scholars. It is a subject of absorbing interest, and, of course, it is impossible to overestimate its importance. For lack of thorough in-

vestigation into the subject, there is a good deal of unjustifiable dogmatising about it. Theories are confidently propounded for which there is no sufficient warrant. For instance, the view is generally prevalent, particularly among occi-

dentials, that the ancient Hindus knew only one theory of Kingship, viz., that the King is the representative of God on earth, and rules by Divine Right. The view expressed in the maxim *नारिष्यः दृष्टिवीर्यतः* ("No King but is the representative of God Vishnu"), is the only one that is supposed to have prevailed in Ancient India. It is also generally believed that there was no liberty in Ancient India, that the people never enjoyed the right of self-government, that the numerous governments that ruled over the different parts of the country were all absolute and arbitrary. The people were never consulted in carrying on the administration; there was no government even by law; the will of the monarch was supreme. I am not at present concerned with the question how far, if at all, these views are correct. I want simply to urge that the study of this subject is marked by utter lack of the true historical spirit. Large generalisations are made without a thorough and critical examination of even all the available materials, and preconceived notions enthroned as reasoned conclusions. It may suit statecraft to reiterate views which are not quite in accord with facts, but scholarship ought to have no other aim than that of finding out the truth, the whole truth and nothing but the truth. The available materials on the subject are indeed not too numerous, but even such as they are, they have not yet been critically and thoroughly examined with the result that the history of political thought and institutions in Ancient India is still to be written.

I must, however, own with pleasure that within recent years the subject has received a greater measure of attention from scholars. And there seems every reason to think that the commonplace notions on the subject will undergo a good deal of revision in the light of the new knowledge that is being acquired through the assiduity of our eminent scholars. The credit of giving a fresh impetus to this study belongs to Mr. R. Shamashastry B.A., of Mysore, whose publication of *Chanakya's Artha-Shastra* or "Science of Politics" in 1905-06 was a literary event of the greatest importance. The *Arthashastra* throws a flood of light not only on the political condition of Ancient India in the reign of Chandragupta, but also on the political thought and institutions that

were current at the time. The interest aroused by the *Arthashastra* has been kept up, and to a certain extent diffused among laymen by Mr. Narendranath Law's "Studies in Ancient Hindu Polity," published last year. His book is based on the *Arthashastra* and gives a good popular account of the government and administration in the reign of the great founder of the Magadha Empire. Probably inspired by the example of Mr. Shamashastry, Prof. Benoykumar Sarkar of the Bengal National Council of Education has published a translation of the *Sukraniti*, and his introductory volume in which he proposes to treat of such important questions as (1) the data of ancient Indian economics, (2) the data of Ancient Indian Polity or Constitution, (3) the data of Ancient Indian Public Finance, (4) the data of Ancient Indian Jurisprudence and (5) the data of Ancient Indian International Law, is awaited with the greatest interest.

Prof. Benoy Kumar Sarkar is very enthusiastic in his praise of the *Sukraniti*. He says—

"Strictly speaking, the position of *Sukraniti*..... is unique and unparalleled. It is, in the first place, a manual of guidance to Kings and statesmen, as well as the Bible of the Demos—at once the work of a Machiavelli and a Rousseau. In the second place, it is a handbook of economics, politics, ethics and what not."

I confess, I do not feel the same glowing enthusiasm for the treatise, and, rather think that it is not at all necessary to indulge in such extravagant praise in order to show that, on the whole, it is a remarkable production on ancient Indian Polity. It contains in all five chapters. The first treats of the duties of Kings. The second deals with the functions of the Crown Prince and other state officials. The third gives general rules of morality to be observed by princes and people alike. The fourth chapter, which is a very large one, consists of seven sections and deals with the characteristics of friends, neutrals and enemies, with treasure, arts and sciences, social customs and institutions, the administration of justice, with fortresses and the army. The last chapter is a miscellaneous one, and lays down additional rules of morality calculated to promote the welfare of the state and the people. It is thus a comprehensive treatise and discusses various questions concerning government, administration, the organisation of national

military resources, war and general morality.

The design of this paper is a modest one. It does not seek to attempt an exhaustive review of the *Sukraniti*, but simply aims at considering the notion of Kingship as found in it. After fully setting it forth, I propose to compare and contrast it with the notion of Kingship as it obtained in Europe, in the early centuries of the Christian era.

In order to properly appreciate this comparative study of the notion of Kingship as it obtained in Ancient India in the period represented by the *Sukraniti* and in Europe in the corresponding period, it is necessary to determine the age of the *Sukraniti*. The fact that the *Sukraniti* is highly praised by the *Kamandakiya*, another but less important treatise on polity, and that many verses from it are quoted in the latter, clearly proves that the age of the *Sukraniti* must be anterior to that of the *Kamandakiya*. Now with regard to the age of the *Kamandakiya* Dr. Frederic remarks as follows in a report submitted by him to the Batavian Society of Arts and Sciences on the Sanskrit literature of the Island of Bali :

"It appears that the most popular work on the Polity in that island is called *Kamandakiya Nitisara*. The researches of Sir Stamford Raffles and Crawford show that the predominance of Buddhism in the island of Java obliged the Hindu inhabitants of that place to retire in the fourth century of the Christian era with their household gods and their sacred scriptures to the island of Bali. It has also been shown by the same authorities that since the period of their exile they had not any religious intercourse with India. It would, therefore, follow that the Sanskrit work now available in Bali, including the *Kamandakiya Niti* are of a date anterior to the 4th century A. D."

It would not, therefore, be wide of the mark if we conclude that the *Sukraniti* must have been written sometime before the 4th century A. D., and that it embodies political thought and institutions and the system of administration that obtained in Ancient India in the early centuries of the Christian era. So when we consider the notion of kingship in the *Sukraniti* it must be borne in mind that we are considering a political notion that prevailed in Ancient India about two thousand years ago.

The important verses bearing on this point are most of them contained in Chapters I & II of the *Sukraniti*. I must quote them here in full, in order that my critics may be able to judge for themselves

how far the inferences I draw from them are correct.

"The prince who is virtuous is a part of the Gods. He who is otherwise, is a part of the demons, an enemy of religion and oppressor of subjects. (139-40)

"The king who is restrained, valorous and skilled in the use of arms and weapons, who is the queller of foes and independent of *Niti*, who is a man of parts and has acquired the arts and sciences, who is not an associate of the lower classes, who has long views, who respects old men and attends to *Niti*, and who is respected by meritorious men is known to be a part of the gods. (667-70)

"The King who is otherwise, is a part of the demons and gets hell. (171)

"Sovereignty in a kingdom is deprived of its beauty if there is the King only, but there are no ministers, well disciplined kinsmen and restrained offerings. (189-90)

"The gods ruin and cast down the King who is not a protector, the Brahman who is not a performer of penances, and the rich man who is not charitable. (239-40)

"Those Kings are like oxen (*i.e.* fools) by whom their army is not increased, by whom princes are not made to pay tribute, and by whom subjects are not well protected. (249-50)

"The King who is much attached to actors, musicians, prostitutes, athletes, oxen and lower castes deserves ignominy and is exposed to enemies. (253-54)

"The king who is inimical to the intelligent, who is pleased with cheats and does not understand his own faults, creates his own destruction. (255-56)

"The subjects desert a king who is uncharitable, who insults men, who practices deceit and uses harsh words, and who is severe in punishment. (277-78)

"People do not take to a king who is very cowardly, procrastinating, very passionate and excessively attached to the enjoyable things through ignorance. (279-80)

"Vena was ruined through vice and Prithu was prosperous through virtue. So the ruler should cultivate his interests by placing virtue in the front. (137-38)

"King Dandakya went to the dogs by taking to one of these six enemies, viz., sensuousness; Janmejaya through anger, Rajarsi Aila through cupidity, Asura Batapi through folly, Rakshasa Paulastya through vanity, and King Dambhodhbhava through passion. But the powerful Jamadagnya and the fortunate Ambarisha ruled the world for a long time by giving up these six enemies. (287-92)

"The King should not oppress the poor people by seeking his own interest. For they, dying through repression, ultimately ruin the King. (319-20)

"The King is honoured, because of these qualities. It is not birth that makes a King. He is not respected so much because of his ancestry, as for his prowess, strength and valour. (363-64)

"The ruler has been made by Brahma a servant of the people, getting his revenue as remuneration. His sovereignty, however, is only for protection. (375)

"The Monarch who follows his own will is the cause of miseries, soon gets estranged from his kingdom and alienated from his subjects. (Chapter II, Lines 7 & 8)

"The King who does not listen to the counsels of ministers about things good and bad to him, is a thief in the form of a ruler, an exploiter of the people's wealth. (Chapter II, Lines 515-516)

'One should not do anything that is good to the King but is harmful to the people. (Do. 547)

"If the King be an enemy of virtue, morality and strength, people should desert him as the ruiner of the state. (549-50)

"In his place for the maintenance of the state the priest with the consent of the ministers should instal one who belongs to his family and is qualified. (551-52)

"The written document with the King's seal is the real king. The king is not a king. (Do. 587)

"When the king is addicted to immoral ways people should terrify him by taking the help of virtuous and powerful enemies. (Chapter IV. Sec. 1, 225-26)

"So long as the man is virtuous, only so long is the king. Otherwise both the king and the people are ruined." (Chapter IV, Sec. 1, 227-28)

I have quoted those verses which bear on the nature of kingship; in other words, those which state what was the position of the author of *Sukraniti*, first, with regard to the source of the king's authority, and, secondly, with regard to the all-important question, viz., what should be the attitude of the people towards a king who is bad, wicked, and oppressive. There are other verses which describe the duties and functions of the king and the manner in which he should rule, and administer justice and generally behave towards his subjects, to some of which I shall have to refer later on. For the present, I want to consider what light the *Sukraniti* throws on the questions mentioned above. Those questions, I need hardly say, are among the most important and basic ones in political philosophy and history, and it is precisely on these and similar questions as affecting Ancient India that erroneous notions prevail.

What then are conclusions warranted by the above verses with regard to these questions?

In the first place, it may be noted that the *Sukraniti* does not lay down the proposition that every King, whether good or bad, is a representative or a part of the gods. It makes a clear distinction between a good king and a bad king, and distinctly maintains that it is only the former who is a part of the gods. The latter it describes as a part of demons, not of gods. Again, it clearly says that kingship does not arise from, nor is it a prerogative of birth. It is virtue alone that makes kingship. A king is a king only as long as he is virtuous. As soon as he deviates from the path of virtue and follows the path of vice he ceases to be a king. The conception is not unlike that of the Chinese

held by them since the time of their great national teacher and philosopher, Confucious. The Chinese conception is that a ruler receives his mandate from Heaven, but that mandate must be held to have been exhausted, if and as soon as he shows signs of mis-government, so that it is no disobedience of God's mandate or will to resist or depose a bad ruler; he has exhausted Heaven's mandate, and it is but right that he should be replaced by another to whom that mandate has been transferred. Thus the theory of the divine right of kings is combined with the equally divine right of the people to resist or depose them in case they take to evil ways, and bring suffering and misery to the country. The theory of the *Sukraniti* does not ascribe divinity to every king; it is not every king that is a part of God, or to speak in the language of Confucious, receives a mandate from Heaven. It is only the good king that receives such a mandate, the bad king being a part of the demons from whom alone he may be said to have received his mandate. In one respect, I may remark incidentally, the Chinese theory appears to me to be superior to that of the *Sukraniti*. The latter cannot give a satisfactory explanation of the position of a king who is good for some time, but for some reason or another, changes his ways, and in the end, turns out a bad and oppressive ruler. Whose part is such a ruler? Of the gods or the demons? He cannot be a part of the gods at one time and of the demons at another. On the other hand, the Chinese theory would maintain of such a ruler, that he, indeed, received his mandate from Heaven, but that mandate was exhausted, when he degenerated and became a bad ruler. This is, however, by the way. What I wish to urge is that the theory of the divine right of kings, as commonly understood, finds only a partial and qualified support from the *Sukraniti*, which applies it to good kings only.

The *Sukraniti* does not explicitly consider the question as to the source of the king's authority. But since it ascribes divinity to a good ruler, it may fairly be inferred that, according to it, such a ruler, at any rate, derives his authority from God. But there is at least one verse which contains the germ of the theory that the ultimate source of political power is the authority of the people. Verse 188

(line 375) of Chapter I, distinctly describes him as a servant of the people, his services as such being remunerated by the revenue he obtains. In other places also, it strongly insists that the king should do nothing that might displease the people. In lines 754 and 755, of Chapter I, it says that in any dispute between his officers and subjects, he should side with the latter, and further it is said that he should dismiss the officer who is accused by one hundred men. It would indeed be too much to maintain that these precepts are inconsistent with the theory of the Divine Right of Kings. Nevertheless, I think it is permissible to hold that the idea of the king being the servant of the people whom he ought to do everything in his power to please, and whose side he should take as against his officers, contains the germ out of which the theory of the sovereignty of the people would have fully evolved, if the conditions of Ancient India, which, on account of the existence of numerous independent kingdoms which did not hesitate to war against one another, when it suited their interests or purposes, required all power to be vested in some central authority, had been more favourable to steady and orderly development of political thought.

The next question is, what has *Sukraniti* got to say with regard to the attitude of the people towards a bad ruler who misgoverns the kingdom and sacrifices the good of the people and the State to his own selfish interests? This question it approaches and considers in four different ways, one being negative, and the rest positive. In the first place, it nowhere lays down the duty of unconditional obedience and non-resistance. If the author of the *Sukraniti* had believed in the doctrine of non-resistance, he would certainly have mentioned it in this treatise. But he is not content with merely maintaining a negative position with regard to this question. He strongly denounces a bad king as an ox (i.e. as a fool), as a thief, as an exploiter of the people's wealth and urges (1) that the people should terrify him by taking the help of virtuous and powerful enemies and (2) if this is not found sufficient, even to desert or depose him as the ruiner of the State, and place any other qualified member of the royal family on the throne in his place.

The *Sukraniti* also adopts what may be called the historical method in dealing

with this question. It points out that as a matter of fact, the subjects will rise against a ruler who oppresses them, whether their doing so is or is not morally defensible. The doctrine of non-resistance may or may not be an ethically sound one. But the advocates of this doctrine apparently ignore one fact, viz., that the power of mere abstract theory is never so great as to outweigh all practical considerations. The author of *Sukraniti* has carefully avoided this error to which mere doctrinaire philosophers are liable. He recognises the force of facts and maintains that a bad ruler is always exposed to dangers both from within and without, that the people, when they groan under misery and oppression, cast all abstract theories to the wind, and work for the destruction of the wicked ruler. Lines 319-20 of Chapter I, clearly state that if the king oppresses the people, they, dying through repression, ultimately ruin him. Again, in lines 7 and 8 of Chapter II, it is stated, that the monarch who follows his own will, soon gets estranged from his kingdom, and alienated from his subjects. And the author illustrates these inevitable results by citing historical instances of monarchs, such as Vena and Dandakya who brought ruin upon themselves by their vices and wickedness. He goes even further, and sees divine sanction for this fate of oppressive and vicious rulers. For, in one verse, it is stated that the gods ruin and cast down the king who is not a protector. The destruction of a wicked monarch who neglects his duties and is guilty of misgovernment is not only a popular act, it is a divine act also. Thus the author of the *Sukraniti* maintains both directly and indirectly, that it is no wrong to resist a tyrannous and vicious ruler.

I have thus far considered the position of the *Sukraniti* with regard to (1) the nature of Kingship and (2) the attitude of the people towards a bad ruler. It will be seen from what I have said above that the view generally held that the Ancient Hindus never knew any other theory of kingship than that the king rules by Divine Right, that he is entitled to receive the unconditional obedience of his subjects, and that he should in no case, be resisted, whatever may be his character as a ruler, finds no support from the *Sukraniti*.

I now proceed to consider the notion of kingship as it prevailed in the West in the

early centuries of the Christian era so that we may be in a position to institute a comparison between it, and that in the *Sukraniti*. The subject is exhaustively treated in "A history of Mediæval Political Theory in the West," by R. W. Carlyle and A. T. Carlyle, and the information embodied in this essay is for the most part derived from that book.

The political theory of the Middle Ages with regard to kingship has a double source. In the first place, it is founded upon the theory represented by the Roman Lawyers from the second to the sixth century, and secondly, upon the theory represented by the Christian Fathers from the second to the seventh century.

The Romans were not such keen political theorists as the Greeks, whose contributions to political thought are perhaps unparalleled in the history of political speculation in the ancient world. The notions of the Romans were, however, profoundly influenced by Greek culture and institutions. And the Roman Lawyers, from the second to the sixth century, maintained that there was only one ultimate source of political power, and that was the authority of the people. According to them, even the Emperor owed his authority to the people. Ulpian says that the Emperor's will is law, *but only because the people choose to have it so*. (The italics are mine.) And Ulpian's view sums up the universal theory of the Roman Lawyers. The view is extremely remarkable, because it invests the Emperor with unlimited personal authority, while at the same time maintaining that that authority is based upon the will of the people. It may be compared to Hobbes's theory of the social contract, which maintains that though the sovereign power derives all its authority from a covenant entered into by the people, it has, at the same time, an absolute right to the submission of the subjects, singly as well as collectively.

• A different note is sounded by the Christian Apostles and Fathers and it is interesting to trace the growth of their notion of kingship from the rise of Christianity down to the Middle Ages.

The thirteenth chapter of St. Paul's Epistle to the Romans contains the following important passage bearing on this subject:—

"Let every soul be in subjection to the higher powers: for there is no power but of God; and the

powers that be are ordained of G^d. Therefore he that resisteth the power withstandeth the ordinance of God; and they that withstand shall receive to themselves judgment. For rulers are not a terror to the good work but to the evil. And wouldst thou have no fear of the power? Do that which is good and thou shalt have praise from the same; for he is minister of God to thee for good. But if thou do that which is evil, be afraid; for he beareth not the sword in vain: for he is a minister of God, an avenger for wrath to him that doeth evil. Wherefore, you must needs be in subjection, not only because of the wrath but also for conscience' sake."

Here we have the notion clearly and strongly expressed that the king derives his authority from God, that to resist him is to resist God, and that therefore it is a sin to do so. The king is regarded as a minister of God and his duty is to encourage the good and to repress the evil. There is no idea that the king himself might be an evil one, nor as to what should be done in case he is a bad ruler and fails to discharge his duties.

The same view is urged by St. Peter in his first letter. He says:—

"Be subject to every ordinance of man for the Lord's sake: whether it be to the king as supreme; or unto governors as sent by him for vengeance on evil doers and for praise to them that do well."

This new theory of kingship, from which the theory of the Divine Right of Kings was developed in subsequent ages in all its fulness, owes its origin to Christianity, which at least in its early periods seems to have produced a reactionary effect upon political thought. All new religions and sects are apt to produce a class of fanatics inclined to defy the existing social, political and religious order, and the early Christians formed no exception to the rule. A section of them abused the conception of individual liberty emphasised by Christianity, and betrayed anarchical tendencies. They were suspected of disloyal designs, and some of them went so far as to evince a contempt for all government. St. Paul, St. Peter, and other leaders of the Church had to guard against these undesirable tendencies. But in so doing they went to the other extreme, and expressed views which were subsequently developed into the theory of the Divine Right of Kings.

The Christian Fathers inquire into the origin of government and maintain that the institution of government is not primitive, but was made necessary by the vices of human nature. They hold that God made rational beings in His own image, not to be lords over each other but

to be lords of the irrational creatures, and that, the government of man by man is not part of the natural order of the world. In the state of nature, they say, all men did not require coercive government, because they were all good, and freely and willingly obeyed the wise. But in course of time degeneracy set in, and sin entered the world. And the birth of sin rendered coercive government necessary. Thus, according to the Fathers, government is a Divine institution, and its object is 'to neutralise and remove the evil effects of sin in human society.

If government is a divine institution, the question arises: what is the position of bad rulers? One of the Fathers, Irenæus discusses this question, and his answer is that often God gives men evil rulers to punish their wickedness. The ruler, according to him, is not only the minister of God's remedy for sin, but the instrument of his punishment. Thus in the view of Irenæus, a bad ruler no less than a good one, derives his authority from God and is entitled to obedience.

Another Father, St. Ambrosiaster, describes the king as the "Vicar of God," and says that "the king has the image of God as the Bishop has that of Christ." He also agrees with Irenæus in thinking that the sacred character of the office of kingship cannot be lost owing to any misconduct of the ruler. St. Augustine expresses the same view with a certain added emphasis. He says that even rulers of the worst type such as Nero receive their power through the providence of God, when He judges that a nation may require such rulers. St. Isidore is of the same opinion. He concludes that a wicked ruler is appointed by God just as much as a good ruler. The character of the ruler according to him is adapted to the character of the people: if they are good, God will give them a good ruler; if they are evil, He will give them an evil ruler. Evidently, he ignores the theory that government owes its origin to the entry of sin, as well as the fact that it is not good subjects that require a good ruler so much as bad subjects. St. Gregory the Great goes even further. Referring to the conduct of David towards Saul, he points out how David is said to have refused to lay his hand on him and even to have repented of cutting off the hem of his garment. He takes Saul to stand for a wicked King and David for

a good subject, and concludes that David's attitude shows that "good subjects will not even criticise rashly or violently the conduct even of bad rulers: for, to resist or offend against a ruler is to offend against God, who has set him over men."

Commenting upon the position of St. Gregory the Great the authors of the book 'A history of Mediaeval Political Theory in the West' to which I am indebted for this information, remark:

"There can be no doubt that we have here the doctrine of the sanctity and Divine authority of the ruler in a very strong form: even the seventeenth century apologists of the Divine Right hardly go further in preaching the necessity of obedience and the wickedness of resistance. It is from the doctrine of St. Gregory the Great that the religious theory of the absolute and irresponsible authority of the ruler continually drew its strongest arguments, both in the Middle Ages and later."

Again they remark:

"In St. Gregory the Great, we find in definite and systematic form a theory of the source of authority in Government which is very sharply contrasted with that which we have seen to be characteristic of the legal writers. They trace the source of all authority in the State to its fountainhead in the people. St. Gregory traces the authority of rulers directly to God. The history of Mediaeval political theory is very largely the history of the struggle between these two views, in which, however, for many centuries the combatants change places. For, at least from the eleventh to the fourteenth century, it is the Imperialist Party which defends the theory of the Divine authority of the ruler, it is the ecclesiastical which maintains that his authority is derived from the people."

I have thus traced the rise and growth of the notions which ultimately crystallised into the theory of the Divine Right of Kings. Dr. Figgis in his excellent book on "The Divine Right of Kings" has well summed up the theory as fully developed. He says:—

The theory of the Divine Right of Kings in its completest form involves the following propositions:—

- (1) Monarchy is a divinely ordained institution.
- (2) Hereditary right is indefeasible. The succession to monarchy is regulated by the law of primogeniture. The right acquired by birth cannot be forfeited through any act of usurpation, of however long continuance, by any incapacity in the heir or by any act of deposition. So long as the heir lives, he is king by hereditary right, even though the usurping dynasty has reigned for a thousand years.
- (3) Kings are accountable to God alone. Monarchy is pure, the sovereignty being entirely vested in the king whose power is incapable of legal limitation. All law is a mere concession of his will and all constitutional forms and assemblies exist entirely at his pleasure. He cannot limit or divide or alienate the sovereignty, so as in any way to prejudice the right of his successor to its complete exercise. A mixed or limited monarchy is a contradiction in terms.
- (4) Non-resistance and passive obedience are

enjoined by God. Under any circumstances resistance to a king is a sin and ensures damnation."

The theory of the Divine Right of Kings lingered in England till the Revolution of 1688. The first two Stuarts were the strongest advocates of the theory, and James I., wrote books and made speeches in support of it. "Nowhere," says Mr. Gooch in his little book on *Political thought in England from Bacon to Halifax*, "is the Divine Right of Kings . . . more concisely formulated or defended with more unfaltering conviction than in the pages of the British Solomon." In his treatise on the "True Law of Free Monarchies or the mutual duty betwixt a free king and his subjects," James I., says:

"A good king will frame all his actions according to the law; yet he is not bound thereto but of his good will and for good example to his subjects. He is master over every person, having power over life and death. For though a just prince will not take the life of any of his subjects without a clear law yet the same laws whereby he taketh them are made by himself or his predecessors."

James I., held that "a wicked King is sent by God as a plague on people's sins, and it is unlawful to shake off the burden which God has laid upon them." "The wickedness of the king," he says, "can never make them that are ordained to be judged by him to become his judges." "Patience, earnest prayer and amendment of their lives are the only lawful means to move God to relieve them of that heavy curse." In his speech to Parliament in 1689, he declared:

"Kings are justly called gods; for they exercise a manner of resemblance of Divine power upon earth. For if you will consider the attributes of God, you shall see how they agree in the person of a king. God hath power to create or destroy, make or unmake at his pleasure, to give life or send death, to judge all and to be accountable to none. And the like power have kings. They make and unmake their subjects; they have power of raising up and casting down; of life and death; judges over all their subjects and in all cases, yet accountable to none but God. They have power to exalt low things and abase high things and to make of their subjects like men at chess."

But the doctrine became more and more unpopular; a long struggle ensued between the people and the Crown in which Charles I., lost his head and with the Revolution of 1688, the theory of an original contract was substituted for that of the divinity of kings. "The doctrine of non-resistance," says the historian Gardiner, "was false in itself and hung like a blight for many years over the energies of England. If it had

ever obtained general recognition, it would have cut at the root of all that has made the nation what it is."

We have now enough materials before us to enable us to draw a comparison between the notion of kingship in the *Sukraniti*, and that which prevailed in Europe till the ninth century A.D. and lingered in England so long as the Revolution of 1688. Those materials fully warrant the conclusion that the notion of kingship as found in the *Sukraniti* was much more advanced than that of Europe in the corresponding period. True, the development of our political thought was arrested, and we do not seem to have made further progress until, of course, the establishment of British rule inaugurated altogether a new era in our national history, thought and life. But the political thought of Ancient India as reflected in the *Sukraniti* was undoubtedly superior to that of contemporary European thinkers and writers. The doctrine of the Divine Right of Kings as first formulated by St. Paul, St. Peter, and other Christian apostles and subsequently developed by St. Gregory the Great and other Christian Fathers finds no counterpart in the *Sukraniti*. The *Sukraniti* does not predicate divinity of every king, it does not say that bad kings derive their authority from God as much as good kings, and are sent by Him as a punishment for men's sins; nor does it advocate the doctrine of unqualified and unconditional non-resistance. According to the European theory, every king, good or evil, is a representative of God; according to the theory of the *Sukraniti*, it is only the good king who is a representative of God, the evil one being a representative of Satan. According to the European theory an evil king is an instrument of God's wrath for men's vices and sins, no such view is maintained by the *Sukraniti*. While the European theory lays down the duty of non-resistance even in the case of oppressive rulers, the *Sukraniti* preaches that such rulers should be resisted and even, if need be, deposed, if less stringent methods of bringing them to book are found to be of no avail. In short, the theory of the *Sukraniti* is a greater approximation to the modern theory of constitutional monarchy except in one particular, viz., that it ascribes divinity to a good and virtuous King.

It would not be amiss if I conclude this essay with a brief reference to a few other salient features of the political thought as found in the *Sukraniti*. The *Sukraniti* is a treatise both on politics and ethics. Like the ancient Greeks, the ancient Hindus did not separate politics from ethics. The two were blended together. Nor can it be said that the modern divorce between them has not had certain evil consequences, in particular, the consequence of lowering the standard of international morality. Dr. Jowett, in his Introduction to Aristotle's Politics, says:

"During the last century, enlightened philosophers have been fond of repeating that the State is only a machinery for the protection of life and property. But the ancients taught a nobler lesson, that ethics and politics are inseparable; that we must not do evil in order to gain power; and that the justice of the State and the justice of the individual are the same. The older lesson has survived; the newer is seen to have only a partial and relative truth."

In the same way, Mr. Earnest Barker in his little book on "Political thought in England from Herbert Spencer to the Present Day" says:

"Political philosophy in itself, and apart from other studies is essentially an ethical study, which regards the State as a moral society and inquires into the ways by which it seeks to attain its ultimate moral aim. Assuming a moral ideal for all human institutions, and therefore for the State as one of the greatest of these institutions, political philosophy interprets the State in terms of ethics, and seeks to determine its relation to the moral constitution and development of man."

The author of the *Sukraniti* would have cordially agreed with these authors in the view that the society and the State have both a moral end. Aristotle's phrase that "man desires first to live and afterwards to live well," is well-known. Both he and Plato held that the end and aim of Government is the active promotion of virtue,—of a better and a better life, until it attained as much perfection as is possible in this world. The author of the *Sukraniti* holds the same view, and hence, we find him constantly insisting upon the practice of virtue both by the king and the subjects, and also urging that the king should promulgate not only laws, strictly so called, but moral exhortations also.

The necessity of the State and the government for human evolution is recognised by the author of the *Sukraniti*. In lines 131-32 of Chapter I, it is stated that "without the ruler the subjects do not keep to their own spheres." Again in line 187

of the same Chapter, the *Sukraniti* says, "the subjects, however vicious, must not be without a king."

The *Sukraniti* declares that the Government should not be only moral but also powerful. It does not advocate the doctrine that the State is Force; such a doctrine it would have condemned as immoral, as opposed to the moral aim and purpose of the State. But it does advocate the doctrine that the State is Power and holds that real national prosperity is impossible without both Morality (*Niti*) and Power (*Sakti*). The thirty-fourth line of Chapter I, says that "where there are both *Niti* and *Might*, there flourishes all-round prosperity." This doctrine that success depends both on *Niti* and *Shakti* deserves to be noted. A nation cannot attain to greatness and prosperity, if it acts morally but fails to become powerful. On the other hand, mere power will not bring greatness and prosperity, unless a nation's aims and methods are strictly moral. Power comes to ruin if and when it is divorced from morality.

As the *Sukraniti* regards power as essential to prosperity, it has no sympathy with weak, timid, and pleasure-seeking monarchs who neglect the military resources of their kingdoms. In lines 245-248 of Chapter I, the eight principal functions of the king are mentioned, and two of them are: (1) conversion of princes into tributary chiefs and (2) quelling of enemies. In line 641 of Chapter I, again, it is said that the king should be mindful about strength, prowess and daily preparation for war (*Utthana*). And in lines 15-16 of Section VII, it is declared, that the army is the chief means of overpowering the enemy, and that therefore the king should carefully maintain a formidable army. And in fact, two sections of Chapter IV of the *Sukraniti* are entirely devoted to military topics such as "Fortresses" and the "Army."

There is a general belief that there were no checks on the authority of the king in Ancient India. But this is a mistake. There was indeed no Parliament in the modern sense of the word, and no responsible Government. Nevertheless, the ancient Hindus had evolved a political and social system which in practice left very little scope for the exercise of autocratic powers by the king. In the first place, the greatest care was taken of the education of the

king, who was taught not only logic, economics, the three Vedas, but also in particular, ethics and political science. The *Sukraniti* and other ancient treatises on polity lay the greatest stress on the practice of virtue by the monarch, the object being to develop in him a strong and virtuous character. Secondly the old system as well as tradition required that the king should have a *guru* or preceptor, a man generally of superior intelligence, profound insight and great saintliness. In lines 293-94 of Chapter I, of the *Sukraniti*, it is laid down that, "Augmenting virtue and wealth, which are pursued by the good, and controlling his senses, the king should worship his preceptor." And the *Guru* or preceptor had a recognised and influential position in the Councils of the State. He had a seat in the Council Chamber and was consulted on every important question. And being a *Guru* he expressed his opinions freely and fearlessly, and exercised great personal influence upon the king. And that influence always tended to keep the king on the path of righteousness.

The third check upon the conduct of the King was provided by the institution of ministers. In lines 189-90 of Chapter I, it is stated that "sovereignty in a Kingdom is deprived of its beauty if there is the King only, but there are no ministers." Again, in lines 3 and 4 of Chapter II, it is laid down that "even the king who is proficient in all the sciences and a past master in statecraft should never by himself study political interests without reference to ministers." And in lines 5 and 6 of the same Chapter, it is further said that "the wise ruler should ever abide by the well-thought-out decisions of his ministers—and never by his own opinions."

A still more important and effective check was the institution of a Consultative Assembly—a sort of a Senate composed of the royal kinsmen, friends, ministers, the *guru* and other leading gentlemen specially nominated. Lines 707-8 of Chapter I, of the *Sukraniti* lay down that "the king should discuss royal duties with friends, brothers, sons, relatives, commanders and members in the Council House." The word "members" seems to point to the conclusion that there was in Ancient India a system whereby the king nominated leading citizens as members of his Council—a practice which we find followed in some

Native States even to-day. The *Sukraniti* then lays down rules as to the order in which the members of the Council should be seated in the Council Chamber, and enjoins that "the king should receive in written form the opinions of each separately with all his arguments, compare them with his own opinion, and *then do what is accepted by the many*." (The italics are mine). This shows that according to the *Sukraniti*, the king ought to abide not by his own personal opinion but by the decision of the majority of the Council. And when we remember that in ancient times, custom and Shastric injunctions had all the binding force of law and a written constitution, there can be very little doubt that the adoption of the decision of the majority of the Council was the rule rather than the exception. A strong and intelligent king would no doubt be able to win over the Council to his own views; but if the king was weak-minded and inefficient and still declined to follow the deliberate decision of the majority of this Council, and if his obstinacy in following his own personal predilections resulted in sufferings to the people, they could, as I have pointed out above, bring him to book by threatening to go over to his enemies and if need be, to depose him.

The notion that the Hindu kings in Ancient India lived in semi-divine seclusion, like the *Mikados* of Japan before the Restoration, does not find any support from the *Sukraniti*. The picture which it draws is that of a king mixing freely with his subjects, touring throughout his kingdom with a view to ascertain from personal inquiry their wants and grievances, administering justice in person in the presence of the parties, and participating in popular festivals and enjoyments. The greatest stress is laid upon the proper administration of justice, and Section V of Chapter IV of the *Sukraniti* is devoted to the question, viz.: How and in accordance with what procedure, justice should be administered? It is laid down in lines 9-13 of the section that the king should administer justice according to the dictates of *Dharma-shastras* in the company of the Chief Justice *Amatya*, Brahmins and Priest, but he should never do so singly or in secret. The administration of justice was to be in open Court in the presence of the parties, and the King was always to consult the Chief Justice, the *Amatya*, the Brahmin,

and the Priest before giving his judgment. The duty of personal inspection of villages and towns is laid down in lines 751-52 of Chapter I, which say that

"The king must personally inspect every year the *gramas*, *puras* or cities, and *desas* or districts and provinces and must know which subjects have been pleased and which oppressed by the staff of officers and deliberate upon the matters brought forward by the people."

In conclusion, it may, I think, be justly maintained that the *Sukraniti* embodies, on the whole, a high conception of kingship, comparing favourably with that prevailing in Europe in the corresponding period. If it does not advocate popular government, it must be borne in mind that we are dealing with political thought of more than two thousand years ago, and that, even now, there are thinkers who have no absolute faith in popular government as the best mode of conducting the affairs of the State. We must not

judge of political thought in Ancient India by the standards of to-day; to do so would mean that Time is no factor in the progress of human thought and institutions. Why our political thought and life was arrested and we failed to attain to the development of political life such as we find in many countries of the West, is, indeed, an interesting question to which we shall have to give our consideration; but obviously this is not the proper place for doing so. Suffice it to say that the political thought as embodied in the *Sukraniti* is such that we have every reason to be proud of it. If the vicissitudes of our national fortune tended to arrest the progress of our political thought and life, the present times are peculiarly favourable to such progress. And I conclude with a fervent hope that the subject of political science and political philosophy will receive increasing attention from our scholars and writers.

THE PLACE OF INDIANS IN THE WORLD'S ATHLETICS

JUST two months ago a wonderful long-distance running record was established at Poona, by S. Y. Dattar, who has run more than the standard Marathan course, almost in an incredibly short space of time. Though he has failed to break the world's running record, he has established at least a record run in the East. We may hope that he will some day lower the world's record established in the last Olympic games, in the near future.

The athletes who are still ahead of Mr. Dattar are three only. In the London Olympiad in 1908 J. J. Hayes, the U. S. A. champion, established the Marathan record by running 26 miles 385 yards in 2 hrs. 55 mts. 18¼ secs. In the last Stockholm Olympic games of 1912 this record of Hayes was broken by K. K. MacArthur and William Gitsham, running 25 miles in 2 hrs. 36 mts. 54¼ secs. and 2 hrs. 37 mts. 52 secs. respectively. Dattar has only these last two redoubtable adversaries to meet, Hayes having retired since. But it will be admitted on all hands that Dattar is the

only man to run 27 miles, and considering the greater length of the course, it is a record by itself. It is a matter of deep regret that we Indians do not find a place in the world's athletics, though no other nation in the whole world is more qualified for that honour. It has been proved again and again that the Indians, as athletes, are far ahead of any other nation. For the Indians are born athletes and not made. This statement has long ago been corroborated by English and American experts. The Indians, they say, do not lack anything in the making of athletes. But it has been now the privilege of the Europeans to recognise or not recognise our athletic supremacy, since they are working heart and soul to prove that "A nation is known by its athletes."

In spite of their maintaining that the Europeans are nations of sportsmen, it has been noticed over and over again that they simply refuse to accept the superiority or even the equality of nations black or brown. As a glaring instance of it, we have

the shameful treatment by the French Boxing Association of Jack Johnson. In 1908 Johnson became the Champion Boxer of the world by defeating Tommy Burns at Sydney and the great Jim Jeffries (who was known as the Emperor of the Boxing

GEORGES CARPENTIER
Squaring up to meet
a scientific boxer

ring) at Reno U. S. A. (1909). A few years later Georges Carpentier, the boy champion, became the Heavy-weight Champion Boxer of France at

FRANK GOTCH CHAMPION OF THE WORLD.

the age of 17. He also won the welter weight championship of Europe that very year. Having a great promising boxer on its side the French Boxing Association refused to accept Johnson as champion of the world and declared

GAMA OF LAHORE

Carpentier as the white heavy-weight Boxing Champion of the world, in spite of there being three most stubborn and great boxers, Jack Johnson, Sam Langford and Joe Jeanette to wit. Carpentier became the recognised champion consequently, which is

perhaps the most shameful presumption, and it places before us a most glaring example of Europe's sporting justice.

It has also become difficult for us to participate in the Olympic games. It was to be held in Berlin this year, and to retrieve her lost honor in the last Olympiad, Britain had started an Olympic Games Fund, to which several famous Indians like Ratan Tata had contributed. The British Olympic Games Committee proposed to take representatives from the British dominions, on the side of England, and South Africa, New Zealand, Canada and Australia were thought fit to participate for Britain. We received information from the offices of *Health and Strength and Sporting Life* that it was still undecided whether the Indians would be given a chance. They returned my letter on this subject saying that it could not be published.

Now we shall review the doings of the Indian athletes in various branches of physical culture.

Gymnastics—It is said, that in the Olympic games held in Athens (1892 or 93) Mr. Krishnalal Bysack had won the Individual Gymnastic Championship of the world. It might be a rumour, but we shall feel greatly obliged if any one will please corroborate the fact.

Boxing—There are many Indians who have established their reputation as good boxers. Mr. Gyanada Prasanna Mukherjee, the famous big-game hunter, of Gobardanga, and Mr. P. Mitra of Calcutta are mentioned as only two of the many. In the Inter-University sports Mr. Promode Lal Ray, (Cambridge Trinity), son of the Calcutta barrister Mr. P. L. Ray, has twice won the Inter University welter-weight Boxing Championship. We should have heard more of his exploits had not the University sports been stopped this year. He received his college full blue—a rare honor to an Indian—and now he is in the front working with the British Red Cross Society. The "Boxing," London, had first introduced Promode Lal as a Gurkha, but afterwards they admitted their mistake. In the opinion of some famous English trainers, Promode Lal promises to be a veritable boxing giant like Carpentier; they say,

"Mr. Ray has the rare fighting qualities like Carpentier, in his time he promises to be a world-famous boxer."

This proves quite clearly that boxing,

Top.—AHMUD BUX WAITING FOR ARMAND CHILPERLOD.

Below.—“DABEE CHOWDRAY, at Benares, a vegetarian, 46 years of age, who is said to have lifted a 960lb weight. Such feats of strength are not, by any means, rare among the tribes of India, as Rama Murti, Buttan Singh, and the Indian wrestlers have proved on their visits to this country. Gobar, for instance, who is in England now, swings clubs that no ordinary Englishman could lift, and carries a stone collar of prodigious weight round his neck.”

though it is the national sport of the Europeans, is not absolutely their own. Some years ago, there was the great All-India Boxing Championship Tournament, held at Calcutta. In spite of there being some prizes awarded by Indians notables like Maharaja Prodyotkumar, Raja Tajhat,

George Hackenschmidt on the right, in his new gymnasium at Shoreham, shaking hand with his trainer, Dr. B. F. Roller.

Sir Rajendra Mukerji and Mr. J. F. Madan, no Indian was allowed to take part in it. The All-India Championship is held every year, but to our great regret, not one Indian has ever been allowed to measure his strength and skill with his white fellow-subjects. Some critic might put forward a question, “What qualification have you to join it? Why should you?” Like the immortal coster we would say, “What qualification haven’t we, why shan’t we join?” and finally “why are we not allowed to join?”

Long distance cycling—In 1911 three Parsee gentlemen rode from Peshwar to Bombay, about 1200 miles, on ordinary bicycles. Though none else had accomplished such a great endurance feat, it has not been accepted as the record long-distance cycle race of India, the Calcutta-Bombay motor-bike race having taken its place.

Weight Lifting—It is considered to

L. H. BANI

be a great health-giving branch of physical culture in Europe and America. Many of our countrymen have begun practising weight lifting, considering it to be western, but they do not perhaps know that it has been practised in India since time immemorial. Of course, the systems and implements of the East and West are different. In the West they use iron Barbells and here in India we use stone "Nals." The champion weight lifter of the world is Arthur Saxon; he can lift 370lbs. in one hand, in the bent press style, while Carl Swoboda and Josef Steinback of Austria can lift 500lbs., two hands clean, style. A. Saxon is the accepted champion. About three years ago the weight lifting championship of India was held at Karachi, in which an English private won the championship (heavy weight) by lifting only 270lbs, and he was accepted as such by the English community. Shortly after the Allahabad Exhibition in 1911, Prof. Himmat Bux and Dr. Ishmatulla lifted weights to decide who deserved the Indian weight lifting championship and the proud title of India's strongest man. This "match" took place at Aurangabad, Deccan. Professor Himmat Bux lifted 985 lbs. 9 times and was declared

as the true champion of India and accepted as such by Indians. One Devi Chowdhry of Benares can lift 960 lbs. 6 times. Considering his 46 years of age, it is an unheard of event and appears to be an un-imaginable matter, but fact is fact. It is evident, therefore, that Devi Chowdhry and Himmat Bux are the real men to be the world's champions. There are associations in England to recognise and record these sports. These associations have power to decide a champion. So the lifelong efforts of athletes are amply rewarded and no one can pose and parade himself as a champion. There in England the National Sporting Club controls boxing, weight lifting is controlled by the British Amateur and Professional Weight-lifting Associations. Wrestlers have to obey the authority of the Wrestlers' Union. Similarly there are associations to control other sports, such as swimming, running, etc. We have no such controlling body in India, excepting the Calcutta Football Association. In spite of the fact that the I. F. A. has no real controlling power outside Calcutta, we know very well to what extent the game of football has improved in this country. The condition of our athletics cannot improve until they are controlled by a committee of experts and until the athletic records are appreciated and recognised and athletes given proper incentives.

Wrestling It is this science in which the Indian physical culturist excels. Wrestling has been practised in India since the earliest times. The study and practice of centuries have resulted in its greatest development. It has been proved more than once that Indian wrestlers are the best in the world. We have taken the front rank in the wrestling world, and we sincerely hope that our honor in this particular branch of "physical culture" will be maintained to the remotest future. Many English experts say that

Nowhere in the world the art of wrestling received so much attention as in India.... wrestlers not to be equalled in any other country. Of no other country can it be said, that wrestling is the national sport, and the Indian professional wrestler has nothing to learn from the exponents of the art in Europe or America. Wrestling has been practised in India since the earliest times...."

Some people have a better opinion of the Japanese Jujitsu experts than the Indian Wrestlers. It is a great mistake, for

"None of the tricks of Jujitsu that might be applied

Maurice Deriaz, as the Sleeping Bacchus, from the painting by Gustave Courtois

in wrestling, are unknown to the Indian wrestler. There is this difference, that the latter has been taught to avoid them as being unfair. The wrestler could apply them in any emergency.

It is not known to many that Jujitsu was practised in Northern India, where it was known as "Binot," but it is much to be regretted that this art is dying out very quickly. There are at present only one

but our present worship of all-that-is-western is killing all our national sports, which any other nation in the world would be proud to possess and excel in by all means. It would not be quite stunning to hear that Jujitsu of Japan and Ghina of Iceland are only branches of Indian wrestling. These arts are now nearly dead, and will be remembered only as things of the remote past with the death of the few experts who are still alive.

It is now our foremost duty to revive these sports, otherwise in another twenty years it would be a difficult proposition. We sincerely hope that there will be a great improvement in the culture of the physique if associations like the I. F. A. are established. Separate associations are to be es-

Cherpillod Delaloye.

or two Binot experts in Rohilkhand. It should be one of our foremost duties to revive this sport, for many such arts are gradually dying out for want of support and sympathy as no one ever cares to keep them alive. If we neglect the practise and culture of Binot, etc., thinking that by encouraging it we should be promoting and favouring hooliganism, then the result is obvious. These arts had greatly flourished under the patronage of Indian rajahs and aristocrats,

established to control different branches of sport. If such controlling bodies are established there will be a perfect order among their constituents, and championship titles perfectly safe.

A few years ago in the last Paris Exhibition the Hon'ble Pandit Moti Lal Nehru of Allahabad took the famous wrestler Ghulam there. No Indian wrestler had set foot in Europe before Ghulam. In the Paris Exhibition, Ghulam wrestled with the famous Turkish wrestler Ahmad Madrali, and this Indian lowered the colors of the celebrated Turk almost with-

Ch. Mahmoud Ramjan Ahmed Bux Gulam Mohidin Prof. Ramamurti. Karla. Mujeed Teela. Rahim.

Maurice Deria: Ahmed Bux. JIMMY ESSON.

out an effort. Ghulam had no equal in his time, and it can be safely said that even now no wrestler in the whole world has reached the standard of Ghulam. Ghulam is the ideal of wrestlers and great in the opinion of Europeans. India is happy and glorious to have given birth to such a brave son.

In 1909-10 Mr. R. B. Benjamin took Gama, Gamu, Imam Bux and Ahmed Bux to England. After a short while Mr. Benjamin managed to pit Gama against the famous American athlete and wrestler Dr. Roller (Dr. B. F. Roller, B.Sc., M.D.), and Imam Bux, Gama's younger brother, was also matched against John Lemm, the famous Swiss. Both the parties signed their agreements in the office of the "Sporting Life." Lemm and Roller are reputed to be as formidable and strong as Hackenschmidt and Gotch. John Lemm had won the Hengler's Tournament and with it the title

of the "Champion of the World" in 1908. Everyone in England had hoped that the Indians would get a hollow beating. But the table was turned. Roller was defeated by Gama in twenty minutes and Lemm did not take even 12 mts. time to be laid low by Imam Bux. In Europe and America wrestling matches are not decided by the result of a single bout. There 'the best of three falls' system prevails. Astonished Europe named Gama as 'the Lion of the Panjab' and Imam Bux 'the Panther.' Mr. Benjamin had issued challenges on behalf of his wrestlers to every notable wrestler of Europe and America. The world-famous Hackenschmidt was present in England at this time, but the wrestling public could not make him consent to wrestle with the Indian wonder, Gama. Having won the match with Roller, Gama received his (Roller's) deposit of £1000 and 70 per cent. of the gate money, the balance of 30 per cent. going to Roller. Imam Bux also received £500 and 70 per cent. of the gate money. Some promoters were ready to deposit £7000 if Hackenschmidt would only fight, but the 'Russian Lion' never condescended to. After Roller's defeat, the famous Austrian Zbysco, the world's ex-champion, came over to England and signed articles to wrestle with Gama and went for training for the great event with Apollo (Wm. Bankier) and Lemm. After Lemm's defeat, the Gama-Zbysco match came on. Gama had undertaken to pin Zbysco twice in one hour but this he could not succeed in doing. Those who have seen the Gama-Zbysco wrestling in bioscopes, will easily understand why Gama failed in his agreement. It is not much to say that Zbysco is nearly the double of Gama to look at. Their measurements can here be compared:—

	GAMA.	ZBYSKO.
Neck	18 "	22½ "
Chest	48 " (normal)	58 " (normal)
Biceps	18 "	22 "
Fore-arm	14 "	15 "
Thigh	27 "	32 "
	125 "	• 149½ "

In spite of Zbysco's greater weight Gama was the "top dog" all through the time making Zbysco lie on the mat for full 2 hrs. 45 mts. The match was to be fought out on the second day, but meanwhile Zbysco had slipped away from England. The Englishmen accepting Gama as the winner gave him the "John Bull

Wrestling Belt" and Zbysco's deposit of £1000. Hackenschmidt also left England to save his honor. This match is known in England as the Gama-Zbysco fiasco. After this event Mr. Benjamin, with great difficulty, succeeded in 'pitting' Imam Bux, Gama's younger brother, against Pat Connolly. Imam Bux defeated him quite easily.

Many years ago the then world's champion Tom Cannon came to Calcutta while touring all over the world. The late Hon'ble Maharajah Nripendra Narayan Bhup Bahadur of Cooch Behar arranged a match between Tom Cannon and Rahim, Ghulam's father. The famous English wrestler, being defeated, left Calcutta the next day. Tom Cannon is known in England as the Undefeated Champion of the world, though he was defeated by Rahim in India.

In 1912 Mr. Benjamin returned to India to take a fresh batch of wrestlers and took Prof. Ramamurti with him to England. Of these wrestlers Ahmed Bux, Rahim, Karla, Teela, Ghulam Mohidin are more prominent. Since Gama's visit to England, the English wrestlers were terrorised at the name of the Indians, consequently no one in England came forward to fight Mr. Benjamin's Indians. After waiting a long time Mr. Benjamin matched Ahmed Bux with Maurice Deriaz, the famous Swiss. Ahmed won two falls successively, first in 66 secs., and the second in 9 minutes. Earnest Delaloye, the famous manager of Deriaz brought another Swiss of great fame to England to fight Ahmed Bux. Armand Cherpillod, as the Swiss was called, was defeated by Ahmed Bux in 4 minutes. He did not meet Ahmed the second time, for he said he was hurt in the first bout; he left the stage abusing Ahmed Bux to his heart's content. "Cochon, Cochon, Cochon" (pig, you are breaking my ribs), the agonised cry of Cherpillod, was for a long time the cry of stage humorists.

In 1913 a tournament in Noveau Cirque, Paris, was run by Maurice Deriaz, in which he won the middle weight wrestling championship of the world; in spite of his being defeated by Ahmed Bux, who gave him a start of 6lbs, in weight, Maurice was recognised as the middle weight champion. We can, therefore, see how confusing and unintelligible are these championships of Europe.

Being utterly hopeless to get any match in England Ghulam Mohidin and others went to France, and learning the Græco-Roman style in a short space of time Ghulam Mohidin defeated Maurice Gambier, the Græco-Roman Champion of France and scores of others. The Indians then proceeded to America, but there unfortunately, the Indian heavy-weight Karla, was twice defeated by Zhyseo. Ahmed Bux and Ghulam Mohidin tried their best to fix a match with Frank Gotch, the Champion of the world, but the cunning Gotch did not pay any heed to their challenges or to the newspapers, consequently the Indians had to come back to India.

About two years ago, Mr. Jotindra Charan Guha, alias 'Gobar,' went to England to measure his strength with the European wrestlers. In our boyhood we were classmates in the Metropolitan Institution, Calcutta. I am very proud and glad that my late class-fellow is one of the greatest athletes in the world. The English people were struck dumb at his extraordinary strength and the peculiar system of exercise of his own. "Health and Strength" was lavish in its praise of Gobar; according to this paper, no ordinary Englishman can even lift one of his clubs.

"Gobar, for instance who is in England now, swings clubs that no ordinary Englishman could lift, and carried a stone collar of prodigious weight (160lbs) round his neck."

Some details of Gobar are known already to the readers of this magazine and the "Prabasi," so I need not repeat them here. Gobar first met Jimmy Campbell at the Glasgow Coliseum and then Jimmy Esson, the Champion Heavy-weight wrestler of Britain, at the same place. He won both the contests. In his match with Jimmy Esson, Gobar had a bit of trouble with him in the second test. Being defeated in the first 6 bout, Jimmy Esson struck Gobar several times with his fist and in spite of repeated warnings, he continued this. The judges, at this, stopped the match, and awarded the second fall to Gobar. Gobar obtained a purse of £1500. and 70% of the gate money together with the side-stake. Gobar was present in Paris, when the Noveau Cirque Tourney was in full swing, but he did not join it. Having defeated a few westlers of note in Paris, Gobar went over to America to meet Gotch but this hope of Gobar was never realised. Gotch retired from the wrestling world

last year, handing over his title to 'Americus,' who thus became the champion. Pat Connolly, the Irish, whom Imam Bux had defeated, wrestled with Americus who retired injured from the mat, relinquishing his title to Pat. In spite of the fact that Pat Connolly was defeated by many European wrestlers and Imam Bux he is still the champion wrestler of the world and the Indian Imam Bux has never been counted even among the first class wrestlers. Only a few and hitherto unknown Indian wrestlers have set the European and American wrestlers dancing. We do not know what would have been the fun if they had simply seen either Kikar Singh or Kallu. But the result is the same; merit or no merit, Indians are never to be counted in any serious business like the world's championship matches. Even Negroes are allowed to participate in and win championship titles, but Indians, though they are a great deal more qualified, could not find a place in the same rank with first-rate Europeans.

We have many strong men amongst us, too, of whom Ramamurti, Himmat Bux, K. D. Seal, Bhabani Shaw and G. P. Garga. of Mahishadal are of the greatest note. Of these Ramamurti, K. D. Seal, and Bhabani can support a big elephant on the chest. Ramamurti is the originator of the elephant act; no one in the whole world had even dreamt of this feat before. There are few people in this country who have not seen the great Ramamurti, so it would be needless to enter into a description of his feats. By throwing away a huge weight of 8,000lbs, Ramamurti has become the ideal of weightlifters and is accepted as the foremost of them. Before him Mr. Shyama Kanta Bannerji also became famous for similar strength feats and tiger taming. Shaw is known to Bengalees as Bheem Bhabani. He is not more than 25 or 26 years of age now. He began physical culture at the age of 12. He is a professed master of Wrestling. He was with Prof. Ramamurti's troupe for several years. The Chest measurement of Ramamurti is 48" normal and 57 expanded. He can keep his chest inflated for 10 odd minutes. Bhabani runs the tape round his chest at 42" normal and 48" expanded. Ramamurti can support a stone weighing 8,000lbs (about 100 mds.), he can stop a 22 h. p. motor, can break a $\frac{1}{8}$ inch thick iron chain by the sheer strength of his biceps muscles and

he is the first "Human Roadway" for two fully loaded bullock carts. Bhabani can also do these wonderful feats.

K. D. Seal has also shown his great strength like Bhabani. Mr. Garga of Mahishadal had challenged Goteh for a wrestling match, which was to take place anywhere on earth; he was also ready to deposit 1,20,000 as side stake, but Goteh had never replied to his challenge.

I have here only endeavoured to show

to my readers, that the Indian athletes do deserve championship honor, and like most others, excuse me for the words, are not "fakes" and side-steppers.

SACHINDRANATH MAZUMDAR,

Member of the Health and Strength League, and the British Amateur Weight-lifters' Association, London; Hony. Instructor & Secretary, Physical Culture Branch, Allahabad Sporting Club, Allahabad.

A CURIOUS NORTH INDIAN SUPERSTITION AND ITS PERSIAN AND AFRICAN ANALOGUES

THE ancient Romans had a very lively dread of omens and portents such as earthquakes, monstrous births, temples struck by lightning, statues overthrown, wolves entering the city, and so forth. If such an event occurred, the equanimity of their minds was disturbed to such an extent that they reported it to the pontifices from the places where they were supposed to have happened. If the latter thought that these portents, which boded evil to the whole Roman nation, required some expiation or the performance of some sacrificial rites in order to nullify their apprehended evil effect, they were recorded in the pontifical books. It is not only the uneducated ancient Romans who were subject to this superstitious dread of omens and portents, but some of the educated men were also victims of this nervousness. Professor W. W. Fowler has told us* that educated men like Sulla, Cicero, Varro, Cato and Brutus had this strong vein of superstition in their natures. It has been reported of Sulla by Plutarch that he always carried with him a small image of Apollo which he kissed from time to time and to which he prayed silently in times of danger. Those three eminent Romans of philosophical learning—Cicero, Varro and Cato—were thrown into a fit of terror by a prophecy which would have been pooh-poohed by moderns possessed of a similar degree of culture. In this connec-

tion we should recall to our minds how Brutus was frightened by the appearance to him, on the eve of the Battle of Philippi, of a gigantic and terrible apparition which stood silently by his side and which has been transformed by the Bard of Avon into the ghost of Caesar and used to unify his play.

A similar vein of superstitious dread of portents and monstrous births sways the human nature in rural India even at the present day. Among these monstrous births may be mentioned that of a child possessed of a tooth. To the mind of the simple unlettered rustic in Northern India, there cannot be a portent foreboding direr evil, shadowing forth greater calamities, to the family than the ushering into it of a baby possessing a tooth. Should its entry into this world be followed by the death of a few of the paterfamilias's livestock from some—to him mysterious cause, should some member of his family die even from natural causes shortly after the birth of such a child, the unsophisticated paterfamilias of the North Indian countryside immediately sets about to reason in this way:—"Well, this child has been born with a tooth. Is not this uncanny and supernatural? Surely, it must be so, because babies, in the usual course of nature, teeth several months after their birth! Then again, everything up till now had been going on swimmingly with me and mine. But shortly after this beggarly brat had made his entry into my family,

* *Social Life at Rome in the Age of Cicero*. By W. Warde Fowler, M. A. London: Macmillan & Co., Ltd. 1908. Pp. 344-346.

my cattle began to die off though there was no murrain in my neighbourhood; my so-and-so died though he was hale and hearty. Surely, the baby must be possessed of some sinister influence which is inflicting all these calamities upon me. I am as sure as I am of my own existence that this child with the tooth must be some demon—some *rakshashu*—in human shape."

The next thought that engages his attention is: "How are the coming evils, the impending calamities to be averted? How should the fountain-head of all this evil be prevented from exercising its baleful influence any further?" Thereupon he consults some Brahman priest or astrologer who, with an eye to feathering his own nest well in this business, advises his client to perform some *hom* or sacrificial ceremony for propitiating the wrathful gods who have sent this fiend to torment him. The costly *pūja* or expiatory ceremony is performed; the Brahman priest gets all his perquisites in the shape of his fees, the fruits, the sweets and the rice; the unsophisticated villager goes away with the impression that, with the performance of the *pūja*, the dire calamity impending over him has been averted and he is safe for the rest of his life. But, poor mortal, he is labouring under a mockery and a delusion. Lo and behold! his cattle begin to die off again; very likely he himself—the pater familias—the very performer of the *hom* ceremony—falls ill and lies nigh unto death's door.

Then he again sets about to think and says to himself: "Good gracious! That Brahman—that family-priest of mine—is a downright rogue. He has cheated me out of my money right and left. The money I spent in performing the *hom* ceremony has gone for nothing, for it has not ward off the malignant influence hovering over my head and my house. See! my cattle are again dying off; and what is the unkindest cut of all is that I myself am lying ill and nigh unto death's door. What is to be done now? What should I now do to ward off for good the evil impending over me?" Then he again revolves matters in his mind and, lo and behold! a dark thought flashes across his brain. He murmurs to himself: "What, if I should kill this monstrous child—this fiend in human shape—and bury it in some out-of-the-way place! Who is there to blab out

my secret deed? Dead men tell no tales." Spurred on by this sinister idea, he makes up his mind to kill the baby and bury it secretly. Last and ghastly scene of all that ends this uncanny tragedy is that wherein we find him taking the new-born child with the tooth to some unfrequented outskirts of his village and burying it alive in the belief that he is thereby ridding himself and his family of a dangerous source of evil and calamity.

I have already set forth in my paper on "*The Evolution of Superstition about Unlucky Days and Objects*" * that this is precisely the sort of reasoning which is resorted to not only by people in a low plane of culture but also by civilized men in accounting for the growth of their superstitious beliefs. The psychological doctrine of the Association of Ideas lies at the root of all these beliefs.

That the aforementioned curious North Indian belief was evolved as the result of the process of reasoning set forth above is nowhere more convincingly demonstrated than in the following account of a case wherein an attempt was made to perpetrate the ritual murder of a child supposed to be a monster in human shape, and which happened in the early part of 1914 in the district of Azamgarh in the United Provinces of Northern India:—

"Azamgarh district not long ago became famous through the cold-blooded murder of Mr. Barber as he slept on a charpoy outside his bungalow one night, and the clever piece of detective work by which the Superintendent of Police, Mr. Reynolds, discovered the murderers and brought them to justice. An almost more horrible story now comes from the same district, more tragic in many respects and certainly more strange, a story which might almost make one despair of rustic Indian human nature, did not the thought come to the mind that, in Russia, many people still believe that ritual murder is practised by Jews, and that not so long ago English peasants used to drown unfortunate old women whom they suspected of witchcraft.

"The story is as follows: Not long ago information was brought to the Pawai thana, on the extreme western border of the district, that the partially eaten remains of an infant had been found lying in a jungle. The Thanadar, though an old man, is full of energy, so mounting his tat he galloped off to the place. He viewed the remains, and, in hopes of finding a clue to the mystery, he decided to visit any burial-places there might be round about, to see if there were signs there that hyænas had dug up the body and dragged it away to make their ghastly meal off it. Such an incident would be horrifying enough to people not acquainted with the wild countryside of

* *Vide the Journal of the Anthropological Society of Bombay*, Vol IX, pp. 225-242.

India; but, as a matter of fact, the child whose body had suffered this degradation plays no part in the story, nor is the explanation on record of how the remains came to be in the jungle. It is merely mentioned because it prompted the Thanadar to pay an unexpected visit to the nearest burial-ground, and that brought him to the discovery of the real tragedy. He was informed that, about a mile and a half away, was a dry pond used by the villagers as a graveyard, and thither he straightway rode. He found there our men standing by the side of a newly filled in grave, and dismounting he went up to chat with them. He had just put one or two searching questions when a sound which he described as "ma-a-a" came from the ground directly under his feet. He jumped, according to his own account, about 14 feet into the air; and then, though shaking as if with the palsy, he had the presence of mind to capture three of the four grave-diggers. Another cry like the bleat of a lamb was heard, so the Thanadar hastily ordered the grave to be opened. It was shallow and the work did not take long, and soon there came to view a month old baby-girl--alive! The Thanadar did his best for it and had it fed on milk. Whether he overfed it or whether it had suffered some fatal injury from the burial alive cannot be said. At any rate the baby soon died. It only remained to discover what had prompted this abominably cruel act. The story which his enquiries elicited is a curious instance of the depths to which superstition will drive ignorant people. The case will doubtless come before the law courts in time, but I give the story as it was told to the police. *The little girl, it seems, had one tooth when she was born, and this fact added to the disgust with which Indian parents greet the birth of a daughter prepared their minds for untoward events.* Unfortunately for the baby, circumstances increased their suspicion of so abnormal an infant. Three days after her birth, six sucking pigs of the village were found dead. They had probably been overlaid by their mother; but in the village it was attributed to the presence of the baby with a tooth. The next day a calf died. There are many causes which may bring about the death of a calf, but the villagers were by now in no mood to seek for rationalistic explanations. The day after, a house in the village was burnt down. That was the last straw. So they called in a Brahman to exorcise the spirit of bad luck. *The soothsayer confirmed the theory that the baby with a tooth was possessed of a rakshasha but volunteered to expel it on the usual terms of liberal hospitality for himself and his party.* So the parents gave him of their best, regardless of expense; and, after reciting some mantras, the holy man and his friends departed. But the curse was not removed. That very night the luckless baby's father fell ill. He had probably finished the remains of the Brahman's feast, and the unaccustomed richness of the food had upset him. But of course, he jumped to the conclusion that the rakshasha in his daughter was too strong for the Brahman's mantras. The expense of the entertainment had been wasted. At all costs, he determined to get rid of the baby. To kill her would be murder; but it occurred to him that if he had her buried alive he would be guiltless of blood. With the same sort of idea the ancient Hellenes exposed their superfluous children on the mountains, leaving them "to the gods." And so the tragedy was enacted, and only the coincidence of another baby's body being eaten by wild beasts enabled the police to prevent the "bloodless" killing being carried right through and

passing into oblivion as one of the unrecorded tragedies of India."†

We should now see whether there is current, in any other part of Northern India, the same superstitious belief about the child born with a tooth, or some other belief akin to it. We find that, though the identically exact form of belief is not current in any other part thereof, there prevails in the districts of Rangpur and Malda in Northern Bengal the superstitious belief that, if a child teething before the performance of his "First Rice Ceremony," he will be short-lived, and that the only way of averting the evil is to marry him to a bitch. The prevalence of this belief has been vouched for by the *Dik Prakash* (a Bengali newspaper published in Rangpur) from which the *Indian Mirror* (of Calcutta) for Saturday, the 25th May 1912, has culled the following extract bearing upon the same:—

"A child in some village of the Rangpur District, writes the *Dik Prakash*, recently married a bitch. There is a superstition among the low class people of the district that dentition before the "First Rice" ceremony, which usually takes place at the age of seven months, is an omen of the child's short life; and the canine union is believed to be a great antidote for the evil."

Now, the above item of intelligence suggests the two following questions:—

- (a) What is a "First Rice Ceremony"?
- (b) Why is the child married to a bitch for warding off the threatened curse of short life?

The "First Rice Ceremony" is otherwise known as the *Annaprashana*. It is generally called by the womenfolk as the "*Bhujno*", that is "*Bhojana*" or the feast. It is the ceremony performed for giving rice for food to an infant for the first time and generally celebrated when the child is seven months old. The goddess Shashthi, who presides over child-birth and is the protecting deity of children, is, first of all, worshipped; and then the child is fed with rice, the whole ceremony winding up with a feast to which relatives and friends are treated. The readers of Rev. Lalbihari De's *Bengal Peasant Life* will recall to their mind the way as to how Badan celebrated the *Annaprashana* ceremony of his son Govinda Chandra Samanta, the details thereof and of the feast that followed thereafter.

† Vide the article entitled "*Buried Alive—Auzner Azamgarh Tragedy*" in the *Pioneer* for Wednesday, the 18th March 1914.

Then I come to the next point. In Bengal when the first-born child dies in infancy, or two or more children die successively during their babyhood, the mother pretends to sell her next-born child to the *dhatrī* or midwife in exchange for 9, 7, 5, 3, 2, or 1 cowries in the belief that she is thereby transferring it from her own family to that of the latter and that, by this device, the malignant spirit will be cheated out of his intended victim. Many other expedients are resorted to, as, for instance, the child is called by an opprobrious name; or, if it is a male, it is dressed up as a girl and *vice versa*; or its nose or ears are bored and rings put in therein. By doing all these, it is believed that the Devil will pass over the child in contempt and think it beneath his dignity to make a victim of it. To my mind, the Rangpur custom of marrying the child to a bitch has the same root-idea underlying it as that whereon the practice of selling the child to the midwife is based, namely, that of deluding Old Nick and cheating him out of his intended prey.

The variants of the belief from Azamgarh in U. P. and from Rangpur in Northern Bengal, which have been discussed *supra*, are current among the Hindus only. We have, now, to see whether either of them or any modified form thereof is prevalent among a non-Hindu people. In the course of a rapid survey of the folklore literature of the world, I have found that a variant of this superstitious belief exists among the Persians who are all Moslems of the Shiah sect. Major P. M. Sykes—an acknowledged authority on the customs of Persia—has told us that "Persian mothers nurse their children for two years and the first tooth is watched for even more anxiously than with us, for should a tooth in the upper jaw appear first, the parents will suffer terrible bad luck and even die unless, to avert the evil, the child is thrown from the roof. To avoid this remedy being worse than the disease, four

men catch the falling infant in a blanket."* The custom of killing children born with their teeth also prevails among the Negroes of Africa.†

If we compare the three variants, we find that those from Azamgarh and Persia agree with each other in this respect, namely, that the evil apprehended from the child's teething is supposed to overtake its parents; whereas the modified form current in Rangpur presupposes that the evil will only affect the child itself and shorten its life. The device employed by the believers in the two former variants, for averting the apprehended calamity is the killing of the child either actually or symbolically; whereas the expedient adopted by those who believe in the Rangpur form of the superstition consists of the harmless and magical practice of marrying the child to a bitch. The Persians adopt the make-believe of killing the child by throwing it from the roof; but its life is saved by four men catching the falling infant in a blanket. Whereas the superstitious rustic of Azamgarh sought to kill the child outright by burying it alive. It is only the intervention of the police that saved its life—and alas! that only temporarily, for it died shortly afterwards of some injury it had sustained. Would to God that the unsophisticated villagers of the countryside in the U.P. may wake up and see the absurdity of their superstitious belief and, in order to fulfil the requirements of custom, adopt some make-believe whereby they would be enabled, while pretending to kill the child, to actually save its life!

AHALYA

(Ahalya, sinning against the purity of married love, incurred her husband's curse, turning into a stone to be restored to her humanity by the touch of Ramchandra).

Struck with the curse in midwave of your tumultuous passion your life stilled
 into a stone, clean, cool and impassive.
 You took your sacred bath of dust, plunging deep into the primitive peace
 of the earth.
 You lay down in the dumb immense where faded days drop,
 like dead flowers with seeds, to sprout again into new dawns.
 You felt the thrill of the sun's kiss with the roots of grass and trees
 that are like infant's fingers clasping at mother's breast.
 In the night, when the tired children of dust came back to the dust, their rhythmic
 breath touched you with the large and placid motherliness of the earth.
 Wild weeds twined round you their bonds of flowering intimacy;
 You were lapped by the sea of life whose ripples are the leaves' flutter, bees' flight,
 grasshoppers' dance and tremor of moth's wings.
 For ages you kept your ear to the ground, counting the footsteps of the unseen
 comer, at whose touch silence flames into music.
 Woman, the sin has stripped you naked, the curse has washed you pure, you have
 risen into a perfect life.
 The dew of that unfathomed night trembles on your eyelids,
 the mosses of ever-green years cling to your hair.
 You have the wonder of new birth and the wonder of old time in your awakening.
 You are young as the newborn flowers and old as the hills.

RAVINDRANATH TAGORE.

THE SHADOW ON THE PATH

BY ANNIE O. TIBBITS,

AUTHOR OF "THE PRIDE OF THE POOR," "LOVE WITHOUT PITY,"

"PAID IN FULL," &c.

[All Rights Reserved.]

I.
 FOR the fifth time the shadow lay across
 the path, grim and menacing across
 the white snow, a gaunt shadow
 stretching out a ragged arm pointing
 towards the house.

"I don't like it, and that's the truth,"
 Enid Lancaster said, shivering a little.
 "It's silly to be so superstitious, but it is
 just like a finger of Fate pointing to us—
 it's like the shadow of a woman threaten-
 ing me."

She waited a moment or two before she went in, staring with half-fascinated eyes at the queer shadow which fell across the path between the house and the gate. It was no doubt a combination of the doctor's light next door and the street lamp outside, as she explained to Elizabeth, but it was odd enough. They had been in the house six weeks before it appeared. And now this was the fifth time—the fifth time the gaunt shadow of a woman had lain across the path!

"I'll go and get Elizabeth to keep me company till Philip comes," she said to herself. "I feel just stupid to-night. Oh, that horrid tree; I'll have it cut down to-morrow."

As she crossed the room and the light fell on her face she looked very young, but it was the look of youth some women bear into their very old age, and Enid Lancaster had known trouble and sorrow and loneliness, and to-night the wind reminded her of the thirty years of poverty which had ended only a year ago when a legacy gave her competence. She had now plenty for herself and her old servant who lived with her, but not quite enough to keep and educate the little lad who lay smiling in his sleep upstairs; and somehow the wind reminded her unpleasantly of this fact. By adopting the boy she had straitened her means—had put the burden on her shoulders again which she had longed so to throw off. Why had she done it? She could not tell, except that there had been a look in the childish eyes as he lay in the Home for Homeless Children that overwhelmed her. He was a wretched little waif with frightened eyes, who started at sounds and shrank from a touch. He had evidently been half starved and badly treated, for there were ugly bruises on his little body, and had been at last left unconscious on the doorstep of the Home—deserted, abandoned, and Enid had not the heart to resist the look in his eyes when she saw him thus.

She opened the door giving on to the passage, and started a little as a sudden draught of cold air caught her face. She looked out and found the front door open, and the figure of an old woman outlined against the light.

"Elizabeth!" she cried. "What are you looking at?"

The woman turned, and as she did so

the wind rose up and swept round the house with a peculiar cry.

"Just hark at that, miss. That there cry in the wind ain't no more natural than the shadder yonder."

"Oh, what nonsense, Elizabeth," Enid cried. But she shivered still, and going to the door peered out into the cold night. "You know you liked the house," she added.

"Aye, miss, 'tis all right to the look on it, but you don't know a house till you lives in it. There's no truer sayin' than that, and there's no 'countin' for the happenings since we've been here." Her voice sank suddenly. There had been noises, whisperings, sounds of strange footsteps. No one in the town could tell them anything, no one had suspected the little grey house was haunted, but that it was, Elizabeth was convinced. Not only had that mysterious shadow taken to lying across the path, but there had been other things too, and only the night before last the most mysterious thing of all had happened. On the landing she had stopped to strike a light. She struck three matches, and three times in succession they had been blown out sharply by some strange breath. At the third Elizabeth fled to Enid.

"The house is haunted," she declared. "There's ghostes outside and in; whatever for did ye come here, Miss Enid?"

"Well, this house is cheap, and we must manage in it until I marry. Oh, Elizabeth, I used to think I was the most unlucky wretch in the whole world, and now—now how it has changed! Why, isn't it queer, Elizabeth, six months ago I had not met Dr. Manners, nor seen the boy, and if it hadn't been for the boy being ill I should never have met Dr. Manners. Now—oh, it's like a fairy tale. Dr. Manners loves me, and for my sake he's going to love the boy, too. He says I may give all my income to him; in fact, he wishes me to do it.

"He's an onhuman sort o'man," put in Elizabeth stolidly; "too good for this world, I reckon."

"Yes, he is," cried Enid. "He's a good fellow. And oh, Elizabeth, I'm a lucky woman."

"Well, I might think so," said Elizabeth unmoved, "if it weren't for these queer things as happen. And that sadder—I dunna like it, miss, that I don't."

They stood together staring out. On the snow-covered paths the shroud lay immovable.

"It seems to be threatenin' thee," Elizabeth said again in a loud voice.

"Oh, but how can it be?" Enid cried. "There is nothing to threaten."

Nothing! as in reply, almost in defiance of her remark, something stirred amongst the bushes.

"Look you, it moved," cried Elizabeth sharply.

Enid gave a little cry and stared forward.

"Oh, you goose," she cried, "it is only the wind moving the tree. It's—hark!—oh, it isn't anything at all—it isn't the shadow. It's Dr. Manners—coming at last."

A tall figure strode forward out of the darkness and on to the white covering of the path.

"Enid! my darling. At last," he said.

II.

"Philip, it's too silly for words, but I'm afraid."

"Afraid, sweetheart? Of what?"

"Of a shadow."

"A shadow?" he cried. "Well really. Is it your own?"

He was a tall, grave looking man, with a humorous twist to his lips which somehow belied the sadness in his eyes.

"No, but Philip, it unnerves me and frightens Elizabeth to death. It lies across the garden path—oh you might have seen it—just like a human figure. It's been there for five nights now. It comes and goes. Sometimes we look out and see the pathway bare and empty, and at other times—there it is. It's there now to-night."

"Somebody watching the house, evidently," Dr. Manners said, half to himself.

"But there's nothing to watch for," Enid cried. "I've got nothing worth stealing."

"No, but I was wondering if perhaps Percy Hinton—"

"Oh, not he," cried Enid flushing. "Why should he?"

"Well, it was a big blow to him when he found you were engaged to me," Dr. Manners answered. "He never suspected it, of course. I stepped in rather quickly, eh, darling? I couldn't wait—I wanted to be sure of you—and he didn't even

know I knew you. Perhaps he hasn't given up hope yet. But it's no good. Nothing shall ever separate us now, Enid."

He caught her to him with a sudden fierceness in his grip, and as he stared out over her head, as he held it against his breast, his eyes had suddenly in them an odd look of pain or fear.

"Enid, say it. Promise you will never let anything come between us? You will love me always!"

"Love you? Oh, Philip, Philip! As if anything could ever alter me! I'm the luckiest woman in the world. Why, all the town envies me. You could have had your choice—you, the most popular doctor and friend in the place."

He shook his head a little, and again there came to his eyes that odd look of pain.

"Everybody loves you," Enid whispered, "from the rich people down to the very poor, and oh, I love you for that—for all your work amongst the poor."

"Don't," he said with a sudden sharpness in his voice. "I doctor amongst the poor because I like hard work," he broke off abruptly. "But never mind that, let us go and unearth your shadow. I expect it will turn out to be Hinton. I never saw a man more knocked over than he did when I told him. Perhaps you had better stay indoors, darling. I won't be long."

"No, I'll come with you," Enid said. Somehow, at the mention of Percy Hinton an odd fear assailed her. She had never thought of him, but now it seemed only too likely to be the explanation of the shadow, and, perhaps, also of the mysterious footsteps they had heard wandering sometimes about the house at dead of night.

"No, I'm coming out with you," she said.

"I'd rather you didn't."

"No, I'll come. It may be nothing after all. The trees are thick there. It may be only the cast of the light through them. We'll go together."

Snow was beginning to fall now, pattering softly over the leaves, and every now and then eddying violently as the wind caught them and flung them wildly about. The icy cold of the night had deepened.

"We're going to have a bad month of it," Dr. Manners remarked lightly. "Elizabeth told me the new moon came in bad, and declared that we may expect worse

than the worse as it reaches the full; but let's see into this shadow. It is one of the trees, no doubt."

He paused a moment to look down the little path and at the dark figure still stretched across it, a shadow still sinister in the moonlight.

"It's decidedly queer," he said, "but it can probably be quite easily explained. You see Dr. Price's light yonder, no doubt that accounts for it. Let us go and see."

He stepped forward as he spoke, and took a few quick steps down the path, peering up at the trees and bushes which grew thickly, and divided the other doctor's house from Enid's.

Abruptly he stopped. There was a sudden quick movement in the bushes, a quick, sharp, broken cry, and a figure sprang out of them and flew like a hare down the path and out into the road. It was a woman. She flung open the gate violently and disappeared.

Enid gave a cry.

"Oh, Philip, how silly we have been; it was nothing after all, only a poor half-witted creature I gave some work to the other day."

"A poor, half-witted——" His voice was strangely halting and broken. "A woman—you gave work to?"

"Yes. She was a stranger here. I'm afraid she drinks, but anyhow, I couldn't help helping her, and she did seem so grateful. Elizabeth thinks she's half crazy. Why, Philip, Philip, what is the matter?"

He passed a shaking hand across his face.

"God help us!" he cried. "She is my wife!"

III.

Dazed, almost motionless, Enid sat while the minutes ticked wearily by. It seemed like hours since Philip had half led, half dragged her into the house and away from the now empty, shadowless path.

"Yes, go on," she said at last "Tell me."

He roused himself. He had dropped heavily into a chair burying his face in his hands.

"I must seem a scoundrel to you," he said. "I told you she was dead, and until five minutes ago I honestly believed she was. I meant to tell you all about her—some day—some day when I was quite sure of your love for me. But we've

known each other such a short time. It can't be six months since you came here and took this house and called me in to attend the child."

"And that was like fate too," Enid said slowly. "If Dr. Price next door hadn't been out it would have been he who would have attended Dick. Now—oh, go on, tell me what it means."

"I'll go—after her—in a moment," he said hoarsely. "I must find her, of course, but I can't yet—not for a few minutes. My wife! And I thought—I thought I buried her six years ago! Heaven help me—six years ago!"

He got up suddenly and began pacing about the room.

"She was the daughter of a man who befriended me when I was a boy," he said, "and when he lay on his deathbed I promised him I would take care of her and look after her. There seemed to me only one way of doing that. I married her. Six months later I discovered what even her father did not dream of, perhaps, indeed, it had lain dormant in her before—perhaps disappointment and despair developed it, for I found out, too, that she had been jilted by a man she had loved desperately, and that she was secretly drugging and drinking. How long she had been doing it I don't know—ever since our marriage, I think—anyhow she was hopeless. I tried to cure her and thought I had succeeded. For two years she managed to deceive me; then one night I came home to find her gone. She left a note telling me she had had the chance of going on the stage and was going to take it and was leaving me for ever. The next thing I heard before even I had time to take any steps to find her was that she was dead."

He broke off abruptly. His face was convulsed and drawn and grey.

"You can guess what it meant to me," he said, "and, Heaven forgive me, the relief! The news came that she had been lost in the burning of a theatre. I went up North to try to identify her, and I thought I did."

His bitter words died sharply, and for a moment he stood motionless. Then abruptly he turned.

"You see," he said, "she lied even in that. She had never joined that company at all. Evidently she was not there—the bones I buried were the bones of some other poor creature, unidentified, who lost

her life in the fire. As she had lied and deceived me in all the three years of our married life so she deceived me then. All this time she has made no sign—not a word to tell me that she was alive. She has no doubt done it on purpose, and God only knows why she should seek to do me harm, for I did my best for her. I tried to be just to her."

"Oh, Philip! And you must go to her. Your wife!"

Alone! Always alone now—only the child upstairs to comfort her.

That night snow fell heavily. It was the wildest storm that had been known for years, and next morning the thick white seemed to have covered all the world. It lay in great drifts upon the woods and fields. It seemed to have smothered everything, and outside Enid's cottage the path-way was obliterated and the great heap of shrubs and bushes buried under the white.

The shadow had gone! That night when the snow had ceased, the moon, sailing high and full, showed sharp and clear nothing but a broad expanse of snow right down to the gate and beyond. No shadow now; all clear and open.

The garden gate clicked, and Enid's heart gave a jump and grew suddenly warm. She rose to her feet, with the colour coming sharply into her face. If it should be Philip—come back?

Her colour died sharply, and all the cold swept back into her heart as there entered into the room not Philip, but Percy Hinton.

"You!" she exclaimed.

"I had to come," he answered. "Manners has told me—he asked me to come to you. Enid—Enid, I want to take his place. He knows it. I want to help you."

"No one can help me," she said, with a choking sob in her voice. "No one can take his place, only the child—Dick. I've got him to live for, after all."

"Enid, you can't waste your life because—because of Manners' misfortune. Enid, I'm rich, I can give you all you want—you and the child. I can do more for him than you can, and I will. Won't you trust me, Enid?"

For a moment the temptation was almost irresistible, but the next the thought of all she had lost, of the man she loved, and the shadow that had crept between them to wreck their lives, over-

whelmed her. She dropped suddenly to her knees and leaned her face against a chair.

"Oh, Philip, Philip!" she sobbed.

Percy Hinton stood stiff and rigid. A change—a sudden look came over his face. He bit his lips.

"It was his wish," he said in a queer, muffled voice. "He—he sort of gave you to me. He asked me, Enid, because he knows how I love you."

"I can't! I can't!" sobbed Enid. "I love Philip, and no other man can take his place. Oh, leave me, leave me."

"I can't," Percy said. "Have pity on me, Enid. I've loved you longer than he has. I've known you longer, and I'll do all he would—and more. Enid, he couldn't love you as I love you and he ought to have told you before about his wife—he said so himself."

"Oh, no, no, it doesn't matter anyhow," cried Enid wildly. "It doesn't make any difference. She's alive, and—she is his wife as long as she lives."

"And she may live forty years," Percy cried quickly; "there's every likelihood of it. Oh, Enid, marry me and let me take you away where you will forget it all. Let me make you forget."

"I can't!"

"Manners knows I was coming to you to-night. He wished me luck. It would be the best thing for you, he said, and you will never see him again. He hasn't found his wife; he knows she doesn't mean to be found, and he has gone away himself. He has left word where she can find him if she wants to, but he couldn't stay here any longer and he has gone."

"Gone!" Enid cried with white lips.

"Yes. He said he should catch the seven o'clock train, and it's eight now."

"Eight!" Enid gave a cry. "Eight, and at this time last night—oh, Philip, Philip!"

She moved forward towards the window as she spoke.

"This time last night I was waiting for him," she cried, "and, staring at the shadow—the shadow on the path outside. It's clear now, but last night she—his wife was hiding in the bushes, and her shadow fell right across the path. Why did she hide there like that? Did she know Dr. Manners was engaged to me?"

"I daresay," Percy said grimly. "No doubt she had some idea of hurting you."

Perhaps she might have let you marry him before she showed herself. May be she would have waited night after night if you had'n't found her out. She was a malignant woman."

"How do you know?" asked Enid.

"I guessed it," he said slowly.

Enid at the window had pulled aside the curtain, and now suddenly she gave a cry.

"Look! Look! The shadow again! There across the snow! Look!"

The next moment she had flung open the window and was out on the path, leaving the curtain moving in the draught and the bitter cold of the night drifting into the room.

Enid was standing on the path, her hands on the shoulders of a man who stood before her, her face uplifted to his.

Percy drew back, breathing sharply. He went a sudden deathly white.

"Manners!" he said.

The moon drifted slowly, and the light of the lamp in the street outside threw their united shadow right to his feet. He drew back, and out of the silence of the night he heard Manners' voice speaking.

"I can't go without saying good-bye," he cried. "I couldn't go without seeing you once more for the last time. Hinton will have told you what I told him. I'm going back to my old house in London—the place where she and I lived—where I tried in vain to cure her. She may come back to me there—some day. Or—or—she may let me know—something of her. I've been searching all to-day and without any success. No one has seen her. I've left instructions with the police, and I shall set detectives to work in London, but it won't be surprising if we never find her. No doubt she does not mean to be found. But oh, Enid—Enid!"

His voice broke and Percy heard it, and heard Enid's reply with a pain that in all his selfish life he had never felt before.

He waited a moment or two; then suddenly a little ghost staggered in at the window and groped her way into the room.

"He's gone—for ever," she said, "and my heart is broken."

"You'll forget—you'll forget," Percy cried, coming forward towards her quickly, "in time."

She started upright.

"If you don't want to make me hate

you—go," she cried. "Go and don't let me ever see you again. You will remind me of him—oh, Philip! I shall never be able to look at you again without remembering. Oh, go. I wish I were dead—oh, indeed, indeed, I wish I were dead!"

Her voice died in the room, and for what seemed a long time there was no sound but the flapping of the blind and the dull drag of the curtain in the window. Then suddenly out of the silence rose a child's frightened cry, and Enid started to her feet.

"It's Dick—my little Dick," she said running across the room.

Before she got to the door Percy stopped her.

"Let me speak for God's sake," he cried, "or I never shall. Let me speak while I want to or I shall be mad again to-morrow, and then it will be too late. Manners' wife is dead—dead. Don't you hear what I say? She's dead—and her body's in a drift—right down at the bottom of Colcut's Drift—right under the snow, and she won't be found for weeks, if then, but she's there. Listen, Enid. I've been mad—mad over you, and it's no good after all. I can't have you—I might have known it. But last night I was outside your gate, and I heard Manners cry out, and I saw the woman rush away and out into the road. I followed her. She walked very slowly, and every now and then stopped as if she could scarcely get along. I could see she was very ill, but I waited until she got right outside the town, and then I stopped her.

"I was almost too late. She was dying. She could scarcely gasp out what she told me, but she managed it at last, and died there in the snow, then it was the madness seized me. I thought if she could remain hidden I could win you—marry you before the truth came out. I picked her up—she was a mere bundle of skin and bones and rags—and carried her across the fields to Colcut's Drift. It's fairly deep and now it is half filled with snow. You can imagine how I watched all night seeing it falling, falling, falling, burying her deeper and ever deeper. I thought I was quite safe. I should have been, but I can't bear to see you unhappy and that child—The cry of the child undid me, Enid—Enid—the boy you have adopted is Manners' son."

"What?"

"Manners' boy. He was born after his wife left him, and that is what brought her here. She had starved and ill-treated him, and she had deserted him, but she was fond of him after all, and she found out about you and where you had taken him, and came here to watch. She used to stand night after night under the bushes, and once or twice she even got into the house to see him. She was the ghost that haunted you—Dick's mother. And now there is only one thing for me to do—to fetch Manners back."

She held out both her hands.
"Oh, God bless you," she cried.

An hour or two later, with Enid held close in his arms, Dr. Manners stood looking down upon his sleeping child.

"It was Fate," he said—"Fate that made you adopt the child and bring him here."

"It was God," Enid said slowly. "Oh, Philip, Philip, he belongs to both of us now!"

GURU GOVIND SINGH

ONE reads in the Upanishads of a small boy, Nachiketa, who, finding that his father was giving away worthless presents as *dakshina* to the priests in a big function, felt ashamed of the meanness and urged feelingly—"To whom will you give me as present, father?" The father replied in anger—"To Death."

To Death he was given and from Death this wonderful boy snatched deathless spiritual teachings for humanity.

A slight variation on the same theme I find in the life-story of Guru Govind Singh. When the Kashmiri pandits, pressed by Aurangzib to relinquish their faith, seek protection and advice from Tegh Bahadur, the Guru says—"Until some virtuous person sacrifices himself at the altar of faith, God's people will find no rest."

At this Govind Singh, the little boy of nine, springs up and says—"Father, who more virtuous than thyself? Give thyself unto Death for their sake."

A spark from the same fire ignites the fire, the father courts death at the court of Delhi and leaves a heritage of deathless nobility to his race.

Besides spiritual knowledge Nachiketa had acquired from death the secrets of lighting a special material fire which are lost to the Indian world. Govind Singh had no material knowledge, but learnt from Death only the art of igniting spiritual fire in the hearts of a people. The fire that digests all physical troubles, all tem-

poral losses, all material discomfort, the fire that impels one to great actions, noble deeds and heroic efforts even unto death—that was the fire he culled from death and that is still stored up for the use of his countrymen in the pages of his life. It was this fire which made him years afterwards as a man, tell his own son of fourteen who, while proceeding to the battlefield, felt thirsty and halted for a cup of water—"Darling! tarry not! Angels are awaiting thee with a cup of the water of immortality; go and take it in the company of thy brother!"

The glow of this fire has spread far and wide over the horizon. Without knowing precisely whence it proceeded, how it proceeded, crowds and crowds of people have admired it. I have been one of the crowd: A decade ago I had placed Gufu Govind Singh in the hierarchy of the heroes of India and taught my brethren in Bengal to offer *pushpanjali* to his memory on the eighth day of heroes in the Dussera Season.

Guru Govind Singh's is not a mere name any more but a spell to raise heroes out of inanities. To read his life is to long for habits of hardihood, for feats of sacrifice, abnegation and martyrdom for a cause,—to embrace a great and noble cause as life's companion and to subordinate all petty things to it.

These two boys of Indian soil—Nachiketa and Govind Singh, are harping in the

ears of every Indian householder: "Father give *me*, your most valuable possession, up in a big cause: father give *thysself* up for a great cause."

But alas for the property of disintegration in things Indian century after century reformers have risen and tried to make Indians one and failed! From Buddha downwards every attempt to preach fellow-feeling and to break down the hard walls of caste between man and man has resulted in adding one more caste to the many existing already. Time after time several drops out of the ocean have separated from the ocean and combined to form a new group distinct from other groups similarly formed before, and stood in martial array against each part as well as the whole.

The opposition of the hill-chiefs to Guru Govind Singh's propaganda is a break-out of the same old disease of India. Guru Govind Singh's dream was

Turk Hindka jhagra mitaun,
Sagal srishtik varna banaun.

He wanted, that is to say, to put an end to Hindu-Musalman disputes and to make all men of one caste.

But his countrymen, including his own followers, are far lagging behind in the way of helping his dream to be realised. *Sagal varnas* have not become one. India has not become one, only a new body of men calling themselves Sikhs or the Khalsa have sprung to fight and be fought against by others of different denomination.

The ninth Guru Tegh Bahadur is said to have prophesied the coming of a white race from the south.

That white race has indeed come, and come to stay—till when?—Till the reason of its being here shall be no more, till we have learnt to do those things which we have been hitherto unable to do. When Indian minds have changed, when India has learnt the art of true fellow-feeling, when all the *varnas* of India have agreed to become one, then and then only will the conscious or unconscious mission of the white race be ended and not before.

The white race has to be instrumental in changing the soul of India by processes known to the Great Alchemist alone, before it can leave India.

SARALA DEVI.

GLEANINGS

A Wireless Telephone Message Across the Sea.

Since Babel fell, it may be said, no stranger thing has happened to human speech than that it should be heard 4,600 miles, as were the words of President Theodore N. Vail, of the American Telephone and Telegraph Company, on September 29, over a whole continent and half an ocean, with absolutely no visible medium of transmission. "It does not matter if for the present such a result is possible only under ideal conditions," declares William Marconi—whose own plans for telephoning without wires across the Atlantic were thwarted by the war—and he forthwith predicts "a fairly perfect service" in the near future. Even more optimistic is Dr. Peter Cooper Hewitt, whose inventions helped to make Mr. Vail's feat possible. "The time is close at hand," he says, "when it will be possible to talk half around the world." And when there is added to these hearty indorsements of the achievement of the Bell system the assurance of Prof. Michael I. Pupin, of Columbia University, that he has discovered a successful method of removing static disturbances and obstructions to wireless telephony, the importance of the New York-Hawaii message is

manifest. This recent achievement, we are told, is the out-growth of tests made only this last spring, when the Bell telephone-system arranged its first aerial conversation between Montauk, L. I., and Wilmington, Del., a distance of but 250 miles. The decision to try for a transcontinental wireless was reached when a talk without wires from Montauk to St. Simon's Island, Me., convinced the engineers of the company that long-distance wireless telephony was indeed practicable. They set to work at once, under the direction of Engineers J. J. Carty and Lloyd Espenchied, and the first news of their success that the public received came with the announcement of the one-sided talk of President Vail to Engineer Carty, from the former's office in New York City by wire to Washington and thence by wireless to the latter at Mare Island Navy Yard, in San Francisco Bay. Then, to quote the *New York Times*' story:

"While over all the world was being flashed the news that the human voice had been sent by wireless telephony 2,500 miles through the air—from Washington to California—a lone operator in a frame hut at the foot of a towering mast on the shore of Pearl

DR. H. BARRINGTON COX AND HIS 'WALKING WIRELESS.'

In the first picture Dr. Cox is equipped with his wireless-telegraph machine, but might easily pass unsuspected. The machine can be hidden away as easily in a business suit. In the last picture the apparently aimless stroller is receiving messages from a "walking sending-station" at some distance away. This method is not a new one, we are told, but its possibilities are still undeveloped.

Harbor, Hawaii, knew the human voice had been heard almost twice that distance, for he had listened to words spoken in Washington, 4,600 miles away.

"That man was Lloyd Espenchied, an engineer for the American Telephone and Telegraph Company, who had been sent to the far-off Pacific island by President Theodore N. Vail to await the test, which came as a climax of more than a year's preparation. Espenchied carried with him only a receiving-instrument, and was therefore unable to talk back to the United States naval wireless station at Arlington, Va. It was hours before he could get wireless-telegraph connection with Mare Island, Cal., and tell J. J. Carty, chief engineer of the telephone company, that a miracle had been wrought."

The public announcement by the American Telephone and Telegraph Company of the success of its experiment, continuing from the formal statement of the actual conversation, explains that—

"The distance over which this wireless communication was held is greater than the distance from New York to London, New York to Paris, or from New York to many other important points, such as Rome, Vienna, and Berlin.

"That transatlantic wireless communication is assured as soon as the disturbed conditions in Europe will permit of tests from this country is obvious when it is remembered that it is much more difficult to send wireless-telephone communication across land than across water. This wonderful wireless message from Washington to Hawaii had to pass over the width of the entire United States

before it encountered the more simple wireless conditions of sending over water."

The actual mechanical details are not yet made public, but President Vail gives us an idea of the nature of the work :

"So far as the perfection of the wireless-telephone goes, there has been no new basic invention; merely a perfection of the sending and receiving-instruments. Of course, in the perfection of these delicate machines there have been minor inventions. But the principle is the transmission of sound by waves in the ether. In this the wireless telephone differs from the wireless telegraph. In the latter electric currents pass through the ether to the destination.

"In the wireless telephone nothing more or less has been done than to send messages precisely as they are sent over telephone-wires without the wires. By a powerful current, the most important factor, the vibrations at the sending-station are greatly magnified. The electric-telephone message that left Arlington was strong enough to run an engine; when it was received it was probably so weak that it could be recorded only by the sensitive receiving-instrument, which magnified the sound-waves precipitated through the ether so that they could make a record at Hawaii. To show that the wireless part of the message was analogous to the wire part, the message I sent to Mare Island was carried to Washington by wire, there thrown out by wireless, and picked up again on a wire at Mare Island before it was heard by Mr. Carty."

The scope of the wireless telephone is apparently

limited, and will always be so. Chief Engineer Carty explains that—

"At certain times of the year, particularly in the summer, static conditions will make it uncertain. Static interference is one of the things we know very little about, and is one of the big problems to be solved. We are going after it.

"The number of calls that can be handled simultaneously on the wireless telephone is limited, but for emergency-use on long distances it will be invaluable, and for use in limited areas it should prove a great boon."

The Marconi Wireless Telegraph Company, rivals of the successful company in the attempt to perfect a wireless telephone, share the belief of the engineers of the Bell system that wireless telephony will never displace the present instrument. As their Vice-President, Edward J. Nally, remarks:

"My engineers have gone deeply into the question of replacing wire lines with the wireless, and they have decided that will not be done. In the first place, it is not conceived that the wire system of a city could be replaced by wireless, but the theory has been advanced that the trunk lines could be done away with, and that each city would have a great wireless station connecting with another great wireless station in another city. I do not believe this will be done. In the second place, the wireless telephone will not prove reliable, as the wireless telegraph has not always proved reliable.

"But the wireless telephone will render service where wires could never reach. Ships can talk to one another, places which could never be reached by wires for physical reasons will be put within range of easy communication. The wireless telephone adds to the wire telephone, but does not take its place."—*The Literary Digest*.

The War's Greatest Cartoonist.

Every Great Crisis has produced a great cartoonist—one who has given voice to the soul-thoughts of the people. By almost common consent the genius of the present war in the field here mentioned is the Dutch artist, Louis Raemaekers, of *De Telegraaf* (Amsterdam). "He is irrepressible in the force and fervor with which he charges the enemy." Necessarily "the Dutch newspapers must be extremely cautious in giving expression to their views," yet Holland is so placed as to see nearest at hand the terribleness of modern warfare. "*De Telegraaf*, for which Mr. Raemaekers makes most of his drawings, is probably the finest and most outspoken journal in Holland, yet, it probably would hesitate to express in type what a Raemaekers cartoon will plainly say in a picture." It is evidently not regarded a breach of neutrality in Holland, "for an artist publicly to express his horror and detestation of war, or to point with unerring exactitude and bitter scorn to those responsible for the high crimes against humanity that have been committed on sea and shore in the name of military necessity.

"You feel that his heart, like that of the master caricaturist of France [Daumier], breaks under the sufferings of war's innocent victims. Almost uncanny are impressions he leaves us—impressions of pallid faces, eyes dilated with horror, ashes and white walls, the silence and coldness of death. Throughout all these phantasmagoric pictures there is no ray of hope, no hint of a partly obscured sun. Death itself stalks through the pages of his album, drinking from a cup of blood. Raemaekers is the portrayer of insanity, of famine, of

despair. There is almost the touch of the madman in his work. It is like laughter in hell. The ghosts themselves might have stepped from the grave and swept the crayon in cold lines across his drawing-board.

"Civilization as a wan, emaciated woman—she is almost Daumier's Spirit of Liberty—is bound and gagged. No touch of color lightens up her face. It is ashen. It is gray and dead. German Militarism,

The Mothers.

—By Louis Raemaekers.

a coarse, half-drunken brute, holds an automatic revolver to her head. 'Am I not a fine fellow?' he demands.

"To the outskirts of the Belgian village comes a workingman, a tiny, home-made coffin in his arms. They are digging trenches for the dead. Within the coffin lies the still form of his 'little Tincke,' who has been shot as a *franc-tireur*.

"Another nightmare glimpse into the heart of devastated Belgium. The picture is revealed to us as if it were cut out by a lightning-flash at night. Amid the ghostly ruins is a family group. Two old people, wasted by hunger and fatigue, lie half dead on the ground. A mother with the devil in her eyes—she is raving, insane—chafes the skeleton-like limbs of a little boy. Ah, but it is a jolly sort of war!

"But if you would know the real meaning of war, study his series of three—the mothers, the widows, and the children. Here are faces that will haunt one in his dreams. The mothers, in deep mourning, kneel before the altar in the flickering candle-light. They can bear the burden no longer. They have

The Orphans.

—By Louis Raemaekers.

The Mothers.

By Louis Raemaekers.

laid it at the Master's feet. The widows, pallid against the dark background, advance holding each other's hands. Here are the young wives, still in the May of love. Here are the older wives, whose love has ripened with the mellowing years. Then come the children down a line of wooden crosses. 'Father, where is your grave?' they ask. It is no more than a fleeting vision, this procession, the dim forms merging into the blur of crosses. But from the silence comes the voice of the artist: 'Krenzland, Krenzland, aber Alles!'

The Dutch Government's request for a strict neutrality observed by the press has resulted in a "timid and hesitating tone" from the papers, but Belgium's woes brought forth a phalanx of artists "who had none of the timidity or faltering spirit that imposed silence on their brothers."

"In perfect harmony with the independent newspaper, *De Telegraaf*, for which he works, Raemaekers has continued his crusade for justice unafraid of menaces or attacks. Thus he has succeeded in showing his fellow citizens that one may remain neutral and even a pacifist without imposing on his convictions a cowardly silence as so many of his contemporaries have done. In doing so he has unsurprisingly wielded the whip of his biting satire. I refer particularly to one of his cartoons which is before me constantly. It represents a sleek, pot-bellied man of the bourgeois type, well satisfied with himself, and therefore respectable, dressed in the height of fashion, cane in hand, his eyes directed upward as if he were expecting bounties from heaven. Behind this personage, who is Mynheer Pieterse, is to be seen an

Apache, holding in his hand a knife that drips with blood—the blood of a woman lying murdered and denuded on the street. Under this bloody satire one may read the thoughts of Mynheer Pieterse, as interpreted by the artist: 'That fellow has only robbed and murdered his neighbour. Shall I call him a bandit? No. I'll greet him politely. That's more neutral.'

"In thus playing the poltroons and egoists, Raemaekers has rendered his country a great moral service, for he has helped to clear the national atmosphere, and has brought timid, hesitating, and troubled minds to a better comprehension of what is humane."

The Bellman gives us these personal details:

"Louis Raemaekers was born in Roermond in the Province of Limburg, Holland, on June 4, 1869. He studied art in Amsterdam, Brussels, and Paris, and is not only a cartoonist but a painter of portraits and landscapes. For eight years he has made illustrations for various newspapers and magazines. He is a member of every important art society in Amsterdam and The Hague, and his pictures have appeared in many art exhibitions in Holland and other countries of Europe.

"Since the beginning of the war he has concerned himself with nothing but the subjects it suggests; all else appears to him of no importance in comparison with it. Personally, Mr. Raemaekers is a gentleman of charming manners, who is highly educated. He has traveled in many countries and speaks several languages very fluently. Comparatively unknown except in Holland until this war began, the fame of Raemaekers has rapidly spread throughout all

ON THE ROAD.

AN AMPHIBIOUS AUTO

An Amphibious Auto.

A number of people have been working of late years to solve the problem of constructing a vehicle capable of traveling upon both land and water. More than one has had some degree of success, but none is better, perhaps, than that invented by a Viennese engineer named L. Zeiner. This "water automobile" or "land-motor-boat," resembles an ordinary touring car in appearance, except that the body is rather higher. But besides its wheels, it is provided with a propeller placed at the rear (not visible in the illustrations). The power of the motor can be switched from the running-gear to the propeller-screw, and vice versa. It is built so as to take quite steep grades with ease. Hence one may ride down the sloping bank of a river, plunge into the current, switch the power to the propeller, and cross the stream in a practicable motor-boat. Arriving at the other side, the engine is switched to put the wheels in commission once more, the bank is easily climbed, and the journey continued without more ado!

The vehicle has made good under practical tests, and is expected to be particularly valuable for military use. It is so built as to go well in swampy and muddy country. In shallow water, wheels and propeller may be used simultaneously; this is a particular advantage when a sand-bank is accidentally encountered in a stream, since it removes the danger of "getting stuck."

"The power is supplied by a 16-horse-power, 4-cylinder motor which gives a speed on land of 45 miles per hour. This speed is diminished in water to about 12 miles per hour."

This car is expected to be peculiarly valuable for military purposes, obviating the delays caused by bridge-building, finding suitable fords, making detours round marshy land, etc. But there are many of the pursuits of peace where it will be permanently useful as well.—*The Literary Digest*.

LOUIS RAEMAEKERS.

Holland's cartoonist, whose heart, like that of Daumier, "breaks under the suffering of war's innocent victims."

Europe, and is now growing in America."—*The Literary Digest*.

ROUND THE WORLD WITH MY MASTER

BY A DISCIPLE OF PROF. J. C. BOSE.

II.

WE are now established in London, with the laboratory fitted up at Maida Vale and the plants safely housed in the Victoria Regia House at Regent's Park. But the real difficulty lay in convincing the scientific public of the altogether unforeseen results of the new investigations carried out in India, and which were to modify so profoundly many of the accepted views concerning the phenomenon of life and its various manifestations. The outside world knows very little how my Master was led from the study of the physics of inorganic substances to the vast field of Response of Matter, Inorganic and Living; that is a story which will form a very important chapter in the scientific advance of the present age.

INFLUENCE IN EARLY LIFE.

Equally interesting it is to trace the influences which moulded his early life and which determined later the trend of his scientific activities. Much of this material I have been able to gather from the older members of my Master's family. The greatest influence in his life was his father, the late Bhagaban Chunder Bose, whose activities were many-sided and who had a remarkably strong personality. He was the Sub-divisional Officer at Faridpore. This place was at the time notorious for its gang of reckless dacoits. He, single-handed, arrested the leader and sentenced him to a term of imprisonment. After serving his term the dacoit appeared before him and spoke of the impossibility of returning to his old life, while any honest occupation was denied him on account of his imprisonment. Touched by this appeal he took the unusual course of taking him into his own service, and this ex-leader of dacoits used to carry my Master to the school. On the way he used to tell him of his bold adventures and of numerous fights, of the pursuit, and the death of his

companions, and his own narrow escapes. He showed him the marks of numerous wounds that covered his body,—how the wound in his thigh was due to a spear-thrust, and the other ugly mark on his breast was caused by an arrow.

The Master was sent to the village vernacular school, while his father's subordinates used to send their sons to the more fashionable English school. His father despised snobbishness of all kinds, and no snobbishness was more distasteful to him than that which kept the fortunate few separate from the people. In this school his comrades were the hardy sons of those who toiled. From the fisherman's son he used to hear wonderful tales of strange creatures that lived in lakes, fens, and rivers. There used to be inundations of the river which left many queer creatures stranded in the fields opposite to my Master's house. The child was full of curiosity and when his father came home, tired with the day's work, he had to answer his son's inquiries about the reasons of things. And the father showed great patience, though his son kept him awake with questions till late at night. The grandmother had then to come with a stick to make the child desist and allow *her* son to have some rest!

This was the beginning of that passionate love for Nature which possessed him so completely. Later in life he used to go out of beaten paths to watch the wild wolves hunting black antelopes in the plains of Central India, or follow the track left by monster pythons on the yielding grass of the Himalayan Terai, or watch from tree-tops bisons, rhinoceros and tigers in the wild jungles of Assam.

His early love for his own village culminated in a longing to know the whole of India and there is hardly any place of historical importance, between the snowy peaks of Kedarnath in the North and Rameswaram in the South, that he has not visited. The rock-cut temples of the earliest Buddhistic period, the Inscriptions

of Asoka, the ruins of the ancient Universities, the Himalayan glaciers, the Stupa at Sarnih, the excavations at Taxila, the ruins of Rajgir, to these and many other places he came in the after time till he realised India, made one by linked history, from the dawn of civilisation to the present day.

Through the vernacular literature he had early access to the great epics, Ramayana and Mahabharata, and the hero he worshipped was not the one who had achieved great success, but Karna, the Disowned, who, in the last encounter which was to determine for him victory or defeat, life or death, rejected the divine weapon that would have decided the day in his favour. For he would use no strength that was not his own nor would he follow any path that was not straight. This must be the law for all who are Disinherited, to win by strength and righteousness that which has been forfeited by decrees of fate.

The dominant influences that impressed my Master's life are then, a spirit of adventure into the unknown, an indifference to success or failure, a passionate love of Nature, an insatiable longing to find out the reasons of things, a devotion to the highest ideals that have been embodied in the national epics, and a living belief in the coming epoch of intellectual revival in his country.

RESEARCH AT THE PRESIDENCY COLLEGE.

I shall now refer to the second phase of his life after return from his first visit to England, when he was offered the Chair of Experimental Physics at the Presidency College, in 1885. There was at that time no laboratory; experiments were, generally speaking, exhibited by drawings on black boards. It was while preparing his lectures on the history of different discoveries that he realised that while the different countries in the world,—England, France, Germany, Italy, Holland, America and even Russia,—had contributed to the advance of modern science, his own country had no place in that glorious record of human effort. The idea that India should ever make any contribution in science was then regarded as beyond the dream of a visionary. How could this be possible, when there was no proper Laboratory, no Scientific Instrument Makers for the manufacture of new and special appliances, by which alone the

hitherto undetected phenomena of Nature could be revealed? My Master accepted all these limitations and by training Indian mechanics he was able to manufacture some of the most important appliances for scientific work. And it was only after ten years of persistent labour that in November 1894 he found himself free to devote his thoughts to pure research. After this in the course of three months he was able to invent special apparatus for investigations on Electro-magnetic Radiation and discover the Polarisation of Electric Ray by Double Refracting Crystals. These results were regarded as of such importance that they filled Lord Kelvin "literally with wonder and admiration." His next work on Determination of Indices of Refraction of various Opaque Substances to Invisible Radiation was accepted and published by the Royal Society, who showed their high appreciation by offering a Parliamentary Grant at the disposal of the Society. This was in 1895, and the next year he was sent by the Government on his first scientific deputation to Europe, where his success at the Royal Society in London and the Academy of Science in Paris and the University of Berlin are well known.

In the course of his investigation on the construction of the most sensitive detectors for electric waves, he found that the uncertainty of the early type of receivers was brought on by fatigue, and that the fatigue of his instruments resembled closely the fatigue of animal muscle. He was soon able to remove the 'tiredness' of his receiver; the application of certain drugs again stimulated the sensitiveness of his detectors to an extraordinary degree. Other drugs depressed the sensitiveness or abolished it altogether. It was to communicate these remarkable results that he was sent to the Paris Congress in his second scientific deputation to the West. His communication evoked very keen interest. As a *speculation* it was accepted as very illuminating; his results were, however, not considered quite convincing, since his methods were quite new. Physiologists were accustomed to detect excitability of animal nerves and muscles by a different method where living tissues under excitation gave rise to an electrical current, this electric current being regarded as a token of life. For at the death of the tissue there is a total

cessation of this electric currents. My Master now took up the method accepted by physiologists and by its means showed that metals gave electric response, this response being exalted under stimulants and abolished under the action of poisons. In his memorable address before the Royal Institution on the 10th May 1901 he exhibited side by side the autographic records of response of the Living and Non-living and said:

"How similar are the writings? So similar indeed that you cannot tell one from the other apart. We have watched the responsive pulses wax and wane in the one as in the other. We have seen response sinking under fatigue, becoming exalted under stimulants, and being killed by poisons, in the non-living as in the living. Amongst such phenomena how can we draw a line of demarcation and say here the physical process ends and there the physiological begins? No such barriers exist."

"Do not the two sets of records tell us of some property of matter common and persistent? Do they not show us that the responsive processes seen in life, have been foreshadowed in non-life?—that the physiological is, after all, but an expression of the physical?—that there is no abrupt break but one uniform and continuous march of law? If it be so, we shall but turn with renewed courage to the investigation of mysteries which have long eluded us. For every step of science has been made by the inclusion of what seemed contradictory or capricious in a new and harmonious simplicity. Her advance has been always towards a clearer perception of underlying unity in apparent diversity."

Between the inorganic substances and the animal creation was the plant world. My Master was also able to establish an absolute continuity by his discovery that the ordinary and so-called insensitive plants were fully sensitive, and gave an electrical reply identical with that given by animals. The experimental demonstration of this he gave before the Royal Society on 6th June, 1901. This result completely negatived the contentions of Sir John Burden-Sanderson, the leading physiologist, who insisted that ordinary plants were quite insensitive, being incapable of giving any electric response and, secondly, that even in the few sensitive plants, such as *Dionaea*, the electric response was of an *opposite* sign to that given by animals, thus establishing a *discontinuity* in plant and animal reactions. As my Master's results completely upset Burden-Sanderson's theories, his communication was looked on with prejudice by him and his followers. Physiologists, moreover, objected to a physicist 'straying into the preserve' that had been specially reserved for the physiologist. In

consequence of this opposition his Paper, which was already in print, was not published. But eight months after the reading of the paper, another communication found publication in the Journal of a different Society which was practically the same as my Master's but without any acknowledgment. The plagiarism was subsequently discovered and led to much unpleasantness.

It was the original intention of my Master, after making over these new results to the physiologists, to return to the many new lines of electrical investigations which were waiting for completion. In fact some of these were of great practical importance, such as the discovery of his extremely sensitive crystal detectors for the reception of wireless signals. Moreover by the action of several stimulants he could exalt their sensitiveness to an extraordinary degree. In practice this meant a great extension to the range of signalling through space. Indeed a very influential syndicate was anxious to secure patents from him. Thus on one side, in physics, was assured success and high recognition, while in the region of physiology he was alone and an intruder, challenging the accepted leaders. In making his choice it was not the assurance of Success that had any attraction for him, it was rather the daring needed of a single man to stand against odds that decided him. And it was thus that he entered into a phase of activity which, for many years, was to test his utmost strength.

The physiologists in general were, as stated before, ranged against him. Moreover there was a feeling that one who was an Eastern was more likely to be led away by the fervour of his warm imagination into the realms of speculation than facts warranted. And Master's greatest difficulty, on reaching England, was to remove this feeling of distrust, and find a place which would enable him to address the leaders of biological science. He had many warm admirers amongst physicists but as a result of excessive specialisation they had no voice in matters relating to life.

But, to resume the narrative of the present tour.

OXFORD.

The late Sir John Burden-Sanderson and his followers were the leaders of biological thought at Oxford and it was my Master's

strong desire to meet his opponents at their stronghold in Oxford. Fortunately the Sherardian Professor to the University was for fair play and invited my Master to give a Discourse at the Botanical Laboratory, where the leading physiologists of the place were asked to attend and take an active part in the subsequent discussion.

The date of the lecture was fixed for the 20th of May 1914. Unfortunately for us the day turned out to be wintry cold. Our great anxiety was for the plants which had to be taken out of the Regent's Park hot-house and bear two hours' cold journey in the train before reaching Oxford. As we neared Oxford the temperature fell still lower and we had great fear that the plants would not revive from the benumbing effect of excessive cold. As soon as we reached the Botanical Laboratory we placed the plants in a hot chamber, hoping that they would be roused from torpidity by the lecture time.

The lecture Hall soon became crowded with advanced scholars, dons and professors. There were also specialists, who had been carrying on very important researches in the famous Physiological Laboratory of Oxford.

The Master began by saying how numerous and contradictory had been the theories that were held as regards the fundamental reactions of life. In the world

of plants no evidence could be more decisive than that afforded by the plant itself. How then are we to make the plant itself record the experience of its inner life? The instrument which rendered this possible was the Resonant Recorder, and by optical projection, every part of this wonderful instrument was projected before the astonished audience. The instrument then began to tick time and measured the perception time of the plant to the thousandth part of a second and also the speed of its nervous impulse. Another apparatus, the Oscillating Recorder, was now put to action with the leaf of our telegraph plant which fortunately had by this time revived from its torpor. And when Our Indian plant recorded its automatic throbbings before the whole audience—pulsations which were practically replicas of the heart-beats of the animal, then the enthusiasm of the audience knew no bounds. And when the same drugs which arrested the human heart-beat and the antidote which revived it were shown to produce identical effects on the throbbing leaflets of the telegraph plant, then there rose a shout and above that was heard the voice of even the most sceptical that 'All life was one.'

Thus was victory won, and those who were the other day our opponents became from that time our staunchest friends.

(To be continued)

POLITICAL IDEALS *

HISTORY, according to the author, is of four kinds. Mere date and fact history is a kind of journalism. Then there is the Carlylean method of the biography of heroes or great men. Another kind of history consists of the records of the habits and customs of the people. The operation of the influence of climate and other natural forces is another method of which Buckle was the leading exponent.

But the best method, in the opinion of the author, is to treat history as the biography of the various ideals which have inspired mankind in different ages.

First the author takes up the Athenian ideal of Liberty.

'Not only is liberty the basis of civilised life, but the progress of civilisation depends on a development of personal independence and local autonomy? Liberty of the group (nation) is regarded as the basis for all natural development of the country or the race. We take this for granted. For no civilised race will endure foreign domination, however admirable its governors may be.' ... 'Not seldom a group

* Political Ideals: Their nature and development: An Essay, by C. Delisle Burs. Oxford University Press. 1915. 26d net. Svo. Pp. 311.

which demands liberty for itself denies it to others.' 'We all agree that the adult individual should not be treated as a child, and that he should not be governed against his own will even for his own good. Thus liberty is still opposed to tyranny or caste government. ... A beneficent tyranny is not to be compared even with an unsuccessful government that is in our own hands.'

But there was much of evil mixed up with the good.

'Athens at her best was full of slaves. There was no political freedom for women.' 'The fall of Athens, in 404 B. C., was directly due, not to the liberty she had attained, but to the attempts she made to limit the ideal to herself. There may be no moral in history; yet one more than half agrees with the Thucydidean conception of a Nemesis overtaking all who refuse to others what they believe to be most necessary for themselves.'

The author then deals with the Roman ideals of law and order, which is the principle of permanence, as Liberty is that of change, both being equally necessary for civilised life.

'But order may be paid for too dearly if it is at the expense of liberty. Obviously in giving order to Europe, Rome had taken away all local vitality ... for order cannot imply the limitation of the natural development of what is set in order. If it were so, life would not be orderly, but only death; an order which is inflexible is tyranny,—or in the words of a keen Roman critic, 'we make a desert and call it peace?' ... as liberty tends to degenerate into license, so order tends to be corrupted into unnatural fixity of the *status quo* ... the order which sacrifices originality, and therefore growth, destroys itself.'

The next subject to be discussed is cosmopolitan equality, which involves the belief in a common humanity and equal capacity for development, irrespective of all distinctions of race or social status. To this idea is due the fact that civilised men of every European race are regarded as political equals. It arose out of a perception of the evils of slavery and of racial exclusiveness involved in such words as 'barbarian' [cf. 'the chosen people' of the Jews, the 'Mlecchas' of the Hindus, the 'Kafirs' of the Moslems], and also from the observance of the cosmopolitan power of Rome and the Christian stoic conception of the brotherhood of man.

The idea of an European concert, of a special sense of unity among European nations, is derived from the Holy Roman Empire and therefore a mediæval conception.

'Mr. Kipling declares that 'Oh, East is East and West is West, and never the twain shall meet till earth and sky stand presently at God's great judgment seat.' He is perhaps unaware that such sentiments are a survival of the Middle Ages, when

Western Europe regarded itself as civilised humanity and the outer world as only 'the rest.' " 'There is more than a tendency to regard European war as almost civil war whereas other warfare is regarded as only 'civilising.' "

But the mediæval conception of a single suzerain or a single 'state' in Europe must be discarded in favour of an unity of co-operating parts, and the ideal "must be guarded against possible corruptions which might arise if the contrast of European with other civilisations led us western nations to make an arrogant and insolent claim to domination over all humanity."

The Renaissance saw the birth of distinct 'sovereign' states regarded as equals, in place of the unity of Europe under an overlord. International Law and the theory of Balance of Power now came into being. The State was however conceived to be an organisation of officials of the governing body as opposed to the people or the nation. But this theory of independent local sovereignty made it possible for the later ideal of nationalism to arise. In England, the national sentiment was gradually formed, by warlike opposition to foreigners, under Edward III and Henry V. In Spain, the alien race and government of the Moors was the precursor of the reign of Ferdinand and Isabella.

Then came the French Revolution with its Rights of Man

"It is a custom among apologists to say that the Christian Church introduced or at least made popular the idea of the equality of man. Nothing could be more glaringly untrue. Official Christianity made no attempt to correct the narrowness of caste prejudice. It accepted first the ranks of the Roman Empire and afterwards the castes of the feudal system; and it employed itself rather in finding justification for a political situation which already existed than in correcting the deficiencies of the system. ... The fact remains that it is to the Pagan Renaissance and not to the Mediæval Church that we must look for the sources of that 'Liberty, Fraternity and Equality' which made the soul of the French Revolution."

The whole effort of the Revolutionists was to realise equality of political rights among all the inhabitants of France, and this equality was to be extended by the destruction of privilege and caste in every country. 'Man is born free and he is everywhere in chains'—these first words of the *contrat social* are, as it were, the cry of pain from which the revolutionary enthusiasm arose. The ideal as it appears to Rousseau is the production and development of individuals who may have the freest possible play for all their faculties.

It involves the proposition that no human being is to be sacrificed to the development of any other. Man has certain 'national' rights, such as that of life, liberty, and the necessities of existence, which, as Blackstone said, 'no human legislation has power to abridge or destroy.' Rousseau fully recognised the inequality of worth among men, but as society is founded on the agreement of all alike, all are entitled to an equal share in political rights. The fundamental likeness in all men underlying all distinctions was emphasised by him and direct government by the 'sovereign people' was considered to be the only safe method. But the revolutionists dreamt of an abstract cosmopolitanism and neglected the fundamental distinctions of race or nationality. Their advocacy of political equality has however fructified in the equal political rights of all sane adults among European nations.

On modern Nationalism the author has much to say which is likely to be specially appreciated in Bengal. The ideal of Nationalism is reflected most clearly in the writings of Mazzini, who is the last great prophet of Nationalism, and

"We may perhaps count this ideal as a contribution made by Italy to the political tradition. Italy has indeed suffered more than any other land from foreigners, and perhaps it is the extremity of the evil there which produced the finest form of the ideal."

Nationalism is the conception that every group of sufficient permanence and with enough of a distinct tradition to have a 'national' character should have an opportunity for developing its own form of law and Government. National differences may be supposed to be due to heredity and environment. As Le Bon says, 'Century after century of our departed ancestors have fashioned our ideas and sentiments.' The existence of national characteristics in features, habits of mind or body, language and even dress, is an instance of the past living in the present. If man had no history, then we could begin without any difficulty to arrange the world upon the best plan conceivable; but each of us individually and each group of us collectively is a result of the past. We are burdened or we are benefited by our descent. But no characteristic can be supposed to be permanent in any nation.

"Not even if Buckle was right and the character of human inhabitants is completely moulded by geographical and climatic conditions—not even so is it possible to speak as though any special virtue were the special possession of any one race of men"

Distinct national characteristics are due not only to natural and human surroundings, but also to difference in tradition.

"Those who live in continuous contact develop and sometimes even produce a special conception of what is admirable in character or valuable in life, or of the place which law and government should have. Such conceptions are embodied in institutions supported by custom and expressed in literature and the other arts. A common memory and a common ideal—these, more than a common blood—make a nation."

The grounds on which the conscious nationalist of modern times would promote and develop the divergent traditions of different nations are as follow :

"In the first place, the destruction of individuality may destroy genius, so the attempt to make all groups of men exactly alike in their customs or creeds may destroy some special character of endurance or wit which may be developed even in a small nation. There is some special quality in every group which it would be well for the sake of the whole of humanity to preserve. But this can only be preserved if the group has an opportunity for characteristic development of its own laws and institutions. The evidence of the past shows that when a race is deprived of its own political life its work is less valuable, and that when a race wins political independence its art and science contribute to the general progress of civilisation "

Each group with a civilised tradition has a right to independent development in view of what it may produce for humanity at large. Secondly, states should vary in their methods of law and government, reflecting in their variety the distinctions of human groups. If each nation is to develop its characteristics, humanity at large is benefited by the preservation of as many distinct types.

"For the human race is not at its best when every man or every group is a copy of every other. Civilisation progresses by differentiation as well by assimilation of interests and character, and we cannot afford to neglect a policy which may develop differences in a world in which communication and cheap manufactures may gradually level out all the variety of the race."

Thirdly, the ideal would not imply the absolute segregation of each group, for a group, like an individual, cannot develop in complete isolation. Nationalism would imply close relation between different groups; but not for the elimination of differences. That close relationship (alliance or federation) would be for the more

civilised development of those very differences. The author's remark about imitation deserves our serious consideration. 'Imitation is in one sense the conservative force.' 'One imitates the foe for the purpose of overcoming him.' [cf. the Japanese policy of protection through imitation] Out of the confused unity of the Middle Ages came the separate states of the Renaissance, and men first began to feel what we now call their nationality. The Renaissance, however, divided Europe rather into a collection of states than into nations. And it was not until the Revolution had come and gone that the long slumbering national consciousness came to birth as a new ideal. It is one of the greatest forces in modern politics. Bengal which has been reunited after going through the throes of a partition will be interested to read the following:

"Nationalism also implied that divisions of the same national group should be removed. A nation with a united consciousness and the same tradition should not be divided into a number of separate states. Thus the Italian Kingdom and the German Empire were formed through the conception that peoples of the same speech or like customs should have the same state system..... Nationalism progressed by the appeal to common sentiments among peoples who had been divided by arbitrary Governments." "The evils out of which Nationalism arises are dynastic and obsolete Governmental systems, causing the majority to feel that their interest or their character is not represented by the administration under which they live. Foreigners in possession give the most tangible form to the evil....."

The defects of Nationalism are (1) A narrowing of the political outlook: local development tends to become village-politics.

"Under this name dying languages [as in Ireland] have been revived and proved obstacles to human intercourse. Small groups in the Austrian empire have gained in peace and civilisation by not having their own institutions and in Switzerland we have an example of distinct racial groups being better for being united in one state."

(2) Group-jealousy: nationalism in a small group becomes Imperialism when the group becomes powerful. When the greater number of each nation can regard other nations as co-operating and not as conflicting, then the best nationalism will be realised.

Modern Imperialism implies a vast territory or many races under one Government and with one dominant partner.

"Cosmopolitanism or Humanitarianism, 'The Parliament of man, the Federation of the world' is too ineffective an ideal at present..... Its strength may

be greater in the near future, but at present it is not a political force."

Imperialism is a sort of halfway house between provincialism and cosmopolitanism. It expands the mind and gives greater scope to the individual than nationalism; so it is not altogether a word for ignoble ambitions, and is a step onwards in civilisation. But a bombastic provincialism, full of local prejudice and an unwarrantable assumption of superiority over 'foriegners' often passes for Imperialism. It differs from village-politics only in the universalism of its impertinence.

"The egregious insolence of a Kipling may impress the unthinking." "The small group or nation which is forced to give up, in the name of Imperialism, its custom, its language, its law, and its forms of Government, may well object that such an empire is an unwarrantable insolence."

The author's views on the British Empire, and on India in particular, are quite liberal, and the same in substance as those expressed by Sir Henry Cotton in his *NEW INDIA*.

"...it is no longer possible to consider that vast number of men, for example, inhabiting Australia, Canada, England and Ireland, not to mention Egypt and India, as united in groups one of which must dominate all the others. That would involve insolence, provincialism and the suppression of local vitality. The only possible way, therefore, of regarding the whole vast group as one is by supposing that each component group is united as an equal with the others in a Federation."

Lord Milner, the author of *Ancient and Modern Imperialism*, is aware that the empire must rest on one of two bases, —an extensive military occupation or the principle of nationality. 'And few Englishmen would be willing to contemplate a purely military Empire.' Coming particularly to India, our author observes:

"India is no more one than is Europe; and although there is growing up a general Indian sentiment, self-government based upon an identity of interests between all the inhabitants of a continent is absurdly impracticable. The end proposed, which might take years to realise, would undoubtedly be the self-government of the distinct parts of India; and this would mean the equality of right in deciding even to maintain any union with England. So extreme a conception of Federation is naturally opposed by those who, like Lord Cromer, still speak of 'our Indian possessions'... 'At bottom,' says Seeley, 'it implies the idea of an estate' to be worked for our benefit; and that confession, he confesses, is 'barbaric and immoral.' Compromise will always be the political excuse for incompetence and illogical thinking; but I see no way out of the difficulty which does not imply either the complete dissolution of the connection between England and the constituent 'dependent' nations of the present Empire or an

admission of these nations sooner or later to political equality... Imperialism, if it is to develop, must be reconciled with Nationalism, and there seems no possibility of this except through Federalism."

"As the Revolutionary classic is French, the Nationalist gospel Italian, and the Socialist programme German, so the first expression of individualism is English. Spencer, Mill and Sidgwick are its greatest exponents, and the German philosopher Nietzsche carries the theory to extravagant lengths in his doctrine of the superman. Individualism is an appeal in the interests of the whole community for special consideration for the exceptional. It is a protest against the modern tendency towards mediocrity and assimilation. The whole race grows in the development of its exceptional men. The last words of Mill's *Liberty* are true for all time: 'The worth of a state in the long run is the worth of the individuals composing it; and a state which postpones the interests of their mental expansion and elevation to a little more of administrative skill.....a state which dwarfs its men in order that they may be more docile instruments in its hands even for beneficial purposes—will find that with small men no great thing can really be accomplished.'

Philosophical anarchism, represented by Prince Kropotkin and others, is a sort of Utopian Individualism. It implies a community of free and fully developed human beings where no external regulation is necessary. Individualism, however, tends to neglect the social environments of man.

"The chief basis of the self-development of a human being is social contact with others; and the development of one is dependent on the development of those with whom he is in contact. Therefore a society in which a few are fully developed is a contradiction in terms. The under-development even of a few will permeate and obstruct the development of all the others of the same group. The under-development of that group will affect the development of other groups, and so from a small evil the whole race will be affected."

If, again, "the present tendency of society is towards selfishness and unenlightened egoism, Individualism should be opposed as giving strength to the very evil which needs most to be eradicated.

Indeed, the individualistic writers, like Mill and Sidgwick, do not really understand the egoism of the average man; their own egoism is so enlightened, their action is so intelligently governed, that they may indeed do good to the community by pursuing what they know to be the highest good."

The Socialist ideal is generally considered to be a sort of mechanical Utopia in which every man has been given a number and registered by his thumb mark in exchange for having sold his soul to the state. But it is to be found, not in any particular organisation, but in the developed social sense which now animates all classes of society. Social causes and social results should be better arranged. Nature

cannot be left to herself. The fittest to survive in the eyes of brute force are not the fittest in the eyes of a civilised man. Thus while admitting development, Socialism deliberately advocated a modification by human foresight of the 'natural' course of development. Mr. Wells and others advocate an organised State system with equal opportunities for all. It is nowhere supposed that all are equal, for opportunity is only made equal in order to discover by trial which of us are better than others. Its weakness is its tendency to an abstract cosmopolitanism, its proneness to treat individuals of entirely different groups as more similar than they are. But it is effective quite outside the ranks of professed socialists. Society is an organic whole, whose health requires the fullest individual development compatible with the just interdependence of its component parts, so that both individualism and socialism are necessary. Socialism and individualism, like nationalism and imperialism, are therefore complementary conceptions and not mutually exclusive.

The author concludes with some very pregnant general observations:

"...Vast natural forces are always at work with which the historian of society and the practical politician have to deal...Man is not isolated, and at every step he is influenced by the mass of different realities around him. And if for general purposes we consider man without reference to the rest of the Universe, we need always to remind ourselves that innumerable forces which we have not noticed have worked and are working to transform man himself... when we have managed to direct such forces as we desire, our realised desire becomes a natural force and is to be reckoned among the other forces which transform us according to laws quite independent of our will." "There is a tendency to stability which even the revolutionary man can do very little to oppose. If he speaks all day against the established order, nevertheless he cannot eat or move or clothe himself without adding his support to things as they are. Therefore there is no danger of complete overturning of the present structure of society." On the other hand, there is a tendency to change which even the conservative cannot resist. If he copies his forefathers most exactly, yet house and clothes decay and his food is always a little different, and the very language in which he praises the good old times, by the use of which he hopes to keep things as they are, insensibly changes its meaning even when he uses it. Therefore there is no danger that we shall ever be troubled for long by the same difficulties. The natural tendencies to stability and to change exist quite independently of the efforts of reformers or conservatives."

After giving a brief *resume* of the main points dealt with by the author, it only remains for us to say a few words regarding the book as a whole. It is pleasant to think how much wisdom often lies

concealed within the pages of an unpretentious little volume which it is within everybody's means to acquire. The book is replete with thoughtful observations, and the wide sweep of the author's study is apparent in every page. It is a book to ponder and digest, and not merely to glance over, and should be a *vade mecum* for all students of politics in our country. Both as a preparation for a more extensive study of the subject, as well as a gathering together of the threads of such study, the book will prove highly useful. That a

book of this kind can be written and published at a time when England is in the throes of the greatest war in recorded history shows the devotion to high thinking which prevails in that country. In the preface, the war has been referred to as an 'ephemeral interest.' Hegel writing philosophy within earshot of Napoleon's guns at Jena could hardly have afforded a better example of the placid atmosphere of detachment in which all high thinking must necessarily be performed.

POLITICUS.

HOME RULE AMONG SAVAGES IN THE BRITISH EMPIRE

THERE is an extensive archipelago in the mid-western Pacific Ocean belonging to Great Britain called the Gilbert (Kingsmill) Islands. In spite of adverse conditions of environment and complete barbarism, says the *Encyclopædia Britannica*, the population of these islands is exceedingly dense, in strong contradistinction to that of many other more favoured islands. The land area of the group is only 166 square miles, yet the population is about 30,000. The Gilbert islanders are a dark and coarse type of the Polynesian race, and show signs of much crossing. They are tall and stout, with an average height of five feet eight inches, and are of a vigorous and energetic temperament. They are nearly always naked, but wear a conical hat of pandanus leaf. In war they have an armour of plaited cocoanut fibres. They are fierce fighters, their chief weapon being a sword armed with shark's teeth. Their canoes are well made of cocoanut wood boards sewn neatly together and fastened on frames. The large population led to the introduction of natives from these islands into Hawaii as labourers in 1878-1881, but they were not found satisfactory. These islands were taken under British protection in 1892.

The Ellice Islands, situated nearly midway between Fiji and Gilbert, were also taken under protection in 1892. Their total area is 14 square miles, and the population is about 2400. Some of them

speak the language of the Gilbert islanders, and have a tradition that they came some generations ago from that group. All the others are of Samoan speech.

Mr. E. C. Eliot, Resident Commissioner in these islands, has contributed an article on them to the December number of *United Empire*, the Royal Colonial Institute Journal, in which he calls them a model protectorate. He says that by an Order in Council gazetted November 12, 1915, the native Governments of the Gilbert and Ellice Islands, which were proclaimed as British Protectorates in 1892, have been, at their own desire, annexed to His Majesty's Dominions. They are to be known as the Gilbert and Ellice Islands Colony. This Colony, of which the population is, according to the *Encyclopædia Britannica*, in a state of "complete barbarism," enjoys the natural right of Home Rule. We will quote the exact words of Mr. Eliot: "To-day a state of 'Home Rule' exists which is probably unique among native races under the protection of the British Crown. With their own code of native laws, revised and amended by a King's Regulation, the people are wisely and justly ruled by their own councils of Chiefs and Elders under the advice and guidance of the few European officials who assist the Resident Commissioner as administrative officers in charge of a number of islands." We take a few more details from Mr. Eliot's interesting article.

The following constitute the native

courts :—The Native Magistrate, the Chief of Kaubere, members of Kaubere, the Scribe, the Island Police; other native officials being the prison warder and warden and hospital orderly.

The "Kaubere" (in the Ellice Islands "Kaupoli") is composed of Chiefs and Elders, the number varying according to the size and population of the island, from about thirty-five to six or seven. The meetings of the Kaubere are called the "Bowi," and are held monthly, though special meetings may be convened more often should necessity arise.

These meetings of the "Bowi" are divided into two sittings. The first comprises the criminal jurisdiction at which the Native Magistrate presides and passes sentence; the Kaubere acting as his advisers. The Magistrate must take the opinion of all members of Kaubere who may be present, and he then decides on the punishment by the guidance of his Book of the Laws, which is printed in the vernacular.

After the criminal cases are disposed of, it is usual for the Chief of Kaubere to relieve the Magistrate as spokesman. All complaints are then heard, reports received from Kaubere in charge of villages and from individuals. Land disputes are looked into and adjusted, and all matters affecting the welfare of the community are brought up for discussion. The Gilbert islander is a born orator, and though his tones may be raucous to our ears, his graceful and expressive movements at once command attention.

Every island is equipped with a well appointed hospital, and gaols for males and females; unfortunately, in many instances, a leper station has also to be included.

From end to end of each island excellent roads extend which are kept up by free labour. The inhabitants take much pride in their roads, so much so that it is a criminal offence for a native to pass without removing a branch, or any obstruction which may be lying in the path. This system of free communal work is not abused; though a relic of former years, it is freely given, and has the great advantage of permitting the imposition of far lighter taxation than would otherwise be necessary.

The revenue of the Protectorate is derived from a light Land Tax, payable in

copra, and graded according to the size, population, and prosperity of each island. In times of drought, to which the Central Gilbert Islands are especially subject, this tax is reduced or wholly remitted. Import duties are charged only on wines, malt liquor, and spirits (which does not affect the native population, since the sale or consumption of all intoxicating liquor is forbidden to them by law), tobacco, scents, and kerosene.

In addition to the Island Police, who are directly responsible to the Native Governments, there is a Protectorate Police Force of about fifty men, who are divided between Ocean Island and Tarawa in the Gilberts, which latter island was at one time the seat of Government. The members of the Protectorate Police Force were originally enrolled from Fiji; but these men are now being replaced by Gilbert and Ellice natives, who have proved themselves both willing and competent to deal with brother delinquents. It is regarded as a special honour to belong to the Protectorate Force, and the pick of the islands can therefore be obtained.

Small retaining fees are paid to Native Island Magistrates, Chiefs of Kaubere, Scribes, Island Police, warders, and hospital orderlies; in the cases of the Native Magistrates and Chiefs of Kaubere, these small payments can only be regarded as sufficient to meet "out of pocket" travelling expenses, and in no way detract from the credit of the good work which these officials willingly give for the welfare of their people. The Chief of Kaubere is generally, but not necessarily, the hereditary Chief of the Island. He patrols the island, and sees that the village Kaubere and Police attend to their duties. There is one Kaubere at least to every village, and in a large island, such as Tabiteuea in the Gilbert Group—which is over fifty miles in length—there are about thirty villages. The members of the Kaubere are unpaid.

The Island Native Scribe deserves a special word of praise. Though he is the clerk to the Native Government, and the custodian of the purse, he is generally a man of substance and position. Since the year 1892, when the Flag was hoisted in these Protectorates, there has been but one case recorded of embezzlement by a Scribe, and although many months may pass without the possibility of a visit from

a Protectorate official, it is seldom that the cash is wrong by so much as a penny. Even to-day comparatively few islands can boast the possession of a safe, but the Island funds are as secure in an old box with the flimsiest of locks, as they could be at home in the latest "burglar-proof" safe.

To what should be attributed the present law-abiding, moral, and happy existence of these children of nature? In years gone by, they were great warriors; but cannibalism has never been proved, and it is doubtful if it ever existed in these islands of the Pacific. The earlier traders and settlers did their best to ruin the natives by inflaming their passions with drink and, in those bad days, the only restraining influence was that of the Missions.

With the advent of the Flag, and drastic regulations forbidding the sale of liquor and the use of firearms, peace was soon restored, and to-day it is difficult to realise that not many years have passed since the time of R. L. Stevenson, when drunken orgies were prolonged into weeks, when the crews of trading vessels were attacked and murdered, and when the daily occupation of the old chief of Butaritari was to sit on the beach with his rifle across his knees, picking off any of his labourers toiling at the construction of his sea wall whose movements did not please him. The sea wall stands in spite of the heavy westerly gales to which it is exposed, testifying to the accuracy of the aim of the Chief in picking off defaulters, and three of his grandsons are members of the Butaritari brass band which provides a large volume

of sound under the guiding baton of a father of the Sacred Heart Mission.

The answer may be that these islanders are, at heart, nature's gentlemen: the spirit of lying and deceit is not in them. They have been scotched, but not spoilt, by contact with some of the worst evils of civilisation, during which time the unselfish devotion of the white missionary checked, to a great extent, the damage which must otherwise have been done.

Another important factor is believed to be the continuance of the system of communal work. This has without doubt had the effect not only of combatting that inertia which is generally found among tropical races for whose maintenance the soil provides with the minimum expenditure of labour, but further of fostering a pride in taking a part in the social well-being of the community. From the Magistrate and Chief of Kaubere to the ordinary labourer, every male between the ages of sixteen and sixty takes his share in the upkeep of his island. There is friendly rivalry as to which island can build the largest and finest "maueaba" or meeting-house: and should it become necessary to infuse energy into road-cleaning, &c., it is sufficient for the inspecting official to contrast the state of the work on one island with that of the last visited.

A perusal of Mr. Eliot's article raises the question whether it is barbarism or civilisation which unfits men for Home Rule. Whatever Anglo-Indians may think, Indians should not be so servile as not to have the courage to believe that they are fit for Home Rule.

17-1-1916.

FACTS ABOUT INDENTURED LABOUR

I have so frequently written on the general aspects of the indentured labour system, that I now desire to confine myself to concrete instances within my knowledge which will illustrate my general remarks.

I am personally cognisant of two instances at least, where a woman whose connection with a man was registered by our law and who therefore was a "marri-

ed" woman, was prosecuted for the crime of not residing (sleeping) in the coolie lines on Saturdays and Sundays (after completing her week's tasks), when she lived with her husband, who was "a free man" outside the pale of the educational institution known as the Coolie lines. The majority of the "marriages" (it may interest Indians in India to learn) in our Colony, would not

be considered valid according to the law and custom prevalent in India, (a great many would be found out to be crimes of bigamy by women), as these are not between members of the same caste nor of the same religion nor always with virgins nor with old maids. The only sanctity attaching to them is the payment of five shillings to the European Magistrate, who writes to the Agent-General of Immigration, who is authorised by law to perform the marriage by making some entries in his books.

An Indian girl who was hardly ten years old was betrothed by her parents to the son of a "free" Indian. The "free" Indian was prosecuted by the estate for harbouring his son's future wife, who being the child of parents under indenture, ought, according to our law, have lived on the estate, though her own parents preferred otherwise.

The law governing the relations between indentured labourers and their employers is certainly far from perfect; even as it is, it can to a very great extent protect the labourers; but does it do so in practice? The law supposes that coolies of all castes, classes, sexes and ages (sometimes even boys of tender years are illegally recruited) have each studied not only the Indian Immigration Ordinance, but also the fine points of relevancy and irrelevancy and that European Magistrates are only machines for manufacturing just sentences or judgments on evidence mechanically and accurately translated to them by their interpreters. The law also seems to take it for granted that every district is efficiently and sufficiently equipped with policemen, Inspectors of Immigrants, Clerks of the Peace and Magistrates and that all these functionaries thoroughly know and do their duties on all occasions without fear or favour; and perhaps it is also taken for granted that every real complaint or grievance that an Indian immigrant may have must always be founded on facts within the knowledge of some willing and courageous (they must not be afraid of the Sahib or the Sirdar) witnesses or others, who must under cross examination by learned counsel or impatient questions from the Bench give such intelligent answers, as would, when translated, by the type of interpreters we have here, be so perfect as to satisfy the most fastidious of examiners for consistency. Unfortunately

we are living in a world where such ideal conditions do not obtain; and most of the provisions of the Indian Immigration Ordinance, which appear to secure protection to indentured immigrants against wrongs from their employers fail in their effect.

I know of districts where there were only Fijian policemen at the station (Civil) who were neither authorised nor fit to deal with grievances of Indians, where Magistrates have to be away for days and even weeks on other than Magisterial duties, where the visits of the Inspector of Immigrants are "few and far between," and where the means of travelling, transit or communication are dilatory, irregular, inconvenient, difficult, and even dangerous, if not impracticable. How are Indian indentured labourers to seek redress of their complaints against such obstacles, as appear almost insuperable, considering their condition, means and intelligence?

I know a concrete case where indentured Indians had to spend about £40 or Rs. 600 to secure a shadow of justice against their white overseer; and even then no lawyer would have advocated their cause on that fee purely from a business point of view, as the district is so inaccessible that many days and even weeks must elapse before one returns to one's proper district. I may add that Magistrates would not often like to adjourn the hearing of cases indefinitely to enable people residing in such districts to secure the services of a lawyer, who would require such a convenient date, as would not interfere with his settled practice in another district; add to this the facts that labourers must not leave their plantations (to see a lawyer) without permission, nor absent themselves from work for any length of time, and that most of the means of traffic are controlled and influenced by people who are likely to have little or no sympathy for the troubles of indentured labourers, who in many cases are allowed to travel, if at all, only on sufferance.

The most unsatisfactory feature of the indenture system appears to be that people cannot buy themselves out of its meshes even by offering fancy prices for their redemption. I have known a Rajput pair—the wife was certainly handsome enough to be a dangerous temptation—who alleged that the white employer was persecuting them from improper

motives. These people had to spend some £30 on lawyer's fees, fines, etc., before they could obtain the approval of the Agent-General of Immigration to their proposal for commuting their indenture, and even then, because the employer was not amenable to the moral suasion of the Immigration Office, this poor couple had to wait for nearly 10 months going backwards and forwards between the estate and the Court House, their lawyer's office and the Agent-General's Office, until finally their employer decided to volunteer for the front (War) and allowed these poor wretches to redeem their liberty. It is reported that this employer was killed in action instantaneously on the borders of France; and it is needless to say that he is not at all regretted by the couple I have referred to.

I may also point out that "agricultural labour during the day" for which strictly speaking labourers are recruited in India, is here made to include work in the sugar mills at night, and even work on farms where cattle are slaughtered on estates for the butcher's trade, not to mention dairy farming or the rearing of horses. Men without any distinction of caste or creed can be required to slaughter for beef and pork, and I am told people other than bhangis or mehtars may be required to do sanitary service on the estates.

MANUAL M. DOCTOR.

FIJI ISLANDS,
Australasia.

HOW TO FIGHT MALARIA IN OUR VILLAGES

THAT malaria is a deadly scourge in Bengal is admitted on all hands, and Government is as keen as the people affected as to the pressing necessity of devising some remedial measures of relief.

2. It is claimed that good drainage, good water, good food and clearance of jungles around habitations of men are among the approved factors contributory to a reduction and prevention of the malarial evil. If one could have these all, that would no doubt be ideal. But, all these cannot be had where they do not exist, for the mere asking, all at once, and we must face the situation as it is and can at least do something to minimise the people's sufferings and the deaths by thousands, by medical aid.

3. There is no doubt that quinine is one of the principal medical remedies for malaria. But can simple quinine alone stop malarial mortality?

Last year, Rs. 25000 to Rs. 30000 was spent in this District of Birbhum in quinine distribution: yet, the deaths from malaria amounted to the appalling figure of 40 per mille, which is the highest malarial death rate for the province, as against 27 for the year previous. Tipperah was the best in the list with only 3 per 1000.

This fact reveals a situation which calls for a moment's serious reflection. In spite of quinine distribution, the deaths were so excessive and unprecedented in a district like Birbhum so well drained naturally and otherwise so good.

4. Simple quinine is efficacious as a prophylactic remedy in simple malarial fever attended with enlargement of spleen. But, when complications such as pneumonia, dysentery, heart trouble or brain congestion, &c., are present, as usually happens in virulent or old malarial fever, other medicines are needed and they have got to be prescribed by competent doctors, and the sick poor must get the medicines at their very doors, free if possible, or, at nominal price, or, we must let them die before our eyes by the thousand.

5. As in agricultural reform, so in public health, what is wanting in our country is 'intensive' treatment, rather than 'extensive'. The energy, attention, time and money spent in desultory endeavours and half-hearted measures, scattered over an unmanageably large area, if focussed and concentrated in selected and typical areas would undoubtedly lead to more tangible results. Control and supervision will be better and more personal and we will get a continuous record of the efficacy of a

particular line of treatment. At least, we shall have some definite programme and definite results which cannot but be useful as an experiment. If the result be satisfactory, we can extend our scheme to other parts of the country gradually.

6. When it is a matter of life and death to a vast population and the people of the villages are either apathetic or helpless it is our duty to do something for them. Large sums of money are often spent on experiments of a doubtful value. Much time, thought and money are spent over prevention of cruelty to animals. When human lives are concerned, a sum of Rs. 10000 or 12000 be it over a mere experiment, would perhaps not be money spent on a bad cause.

In Dinajpur, the Government, of E. B. & Assam, spent Rs. 32000 on kerosening tanks, cleaning jungles and killing mosquitoes, etc., a propaganda which seemed to laymen no better than a mere wild goose chase, yet, the worst critic going through the report on Dr. Bentley's anti-malarial operations cannot but be struck with the amount of useful information brought to light. Even the futility or unsuitability to Indian conditions, of measures found suitable in Mauritius, Panama Canal or Ismailia, have got to be demonstrated before we condemn them.

7. The Japanese Government resorted to the following method in the Formosa Islands:—

To quote from an official report on the subject—

"They set about doing this in a very business-like and thorough-going manner. By way of experiment, certain districts were selected and on a certain day all the inhabitants were summoned to appear at an appointed place to have their blood examined microscopically with a view to finding out if they were 'malaria carriers'. Those in whom the malaria parasites were found, were placed under treatment for 30 days during 2 months in order that the parasites may be exterminated. It is stated that altogether 396621 persons were examined of whom 11396 were proved to be carriers and were treated accordingly. It is now possible to estimate the results printed in a report which has been issued. It is stated that in two districts the mortality from malaria has been reduced to nothing, although in the year before the experiment was initiated, it was at the rate of 15 per one thousand in one of these districts, and 5 per thousand in the other. In another district for which figures were given, it has been reduced from 11.60 per one thousand to 3.39 per one thousand. These results are noted after the system has been in operation for 2 years."

8. Nearer home, Mr. Sarada Charan Mitra (ex-judge, High Court) got good

results by confining his work of anti-malarial reclamation to a selected locality round about his native village, Panishchala, in Hoogly. This also supports my plea for a concentrated line of work or 'intensive' policy.

9. My scheme therefore would be as follows:—

(i) During Malaria epidemics moving dispensaries (in carts specially designed) in charge of sub-assistant surgeons, to march from place to place and treat malaria patients on the spot. Details can be considered hereafter.

(ii) Throughout one whole year (experimentally for the present) operations similar to that described for Formosa to be carried on in typical areas, new areas being taken up after one area has been thoroughly treated.

Spleen census as done in the Dinajpur Operations and blood examination being, of course, the leading lines. Medical experts can decide the details.

10. Floating dispensaries were found useful in Faridpur. The credit for this original idea and its practical success belongs to the personal zeal and guidance of Mr. K. C. De, I.C.S., I believe (I speak from memory).

I quote from the Bengal Administration Report, 1902-03.

"At Faridpur an interesting experiment was made by District Board who started a floating dispensary which regularly visited markets and villages on the Kumar river and afforded a large amount of medical relief to the sick poor" (page 118).

1903-04:—

"The floating dispensary established in the Faridpur District in 1902 is continuing to do good work and is an undoubted advance: the example might well be followed in some of the other water-logged districts. Medicine chests have been supplied to the headmen of outlying villages in a few districts but it is doubtful whether much benefit results. On the other hand, the visits of dispensary medical officers to local markets and fairs have been found useful in a number of instances and is undoubtedly desirable in the remoter districts such as the Chittagong Hill tracts" (page 128).

In Baroda, there are even moving Libraries for popular education.

Moving dispensaries in Bengal may look like an European innovation. But what we are concerned with immediately is the possibility of its practical application to our villages and we must judge the scheme on its merits.

For better supervision and control, fullest use should be made of the executive

gazetted officers—the technical side (medical) being in the hands of the Civil Surgeon. Details can be worked out later on.

11. My proposal now is for grant of money in each district as follows:—

A staff of one sub-assistant surgeon and one compounder with necessary medicines and appliances for one selected centre Rs. 150 per month.

For 4 centres (tostart with) Rs. 600

An Assistant Surgeon
as supervisor Rs. 200

TOTAL 800

or, say, Rs. 1000 a month, to be employed for one year.

Epidemics will be specially dealt with by sepearte special staff and that also on the principle of moving hospitals.

12. A word may be added in this connection as to reclaiming and then reserving village tanks, some of which were magnificent reservoirs of drinking water in their day, but are now over-grown with weeds and rank vegetation, the veritable hot-beds of malarial poison.

I plead for a more flexible, less rigid, in a word, "personal" line of work. Rs. 2000 a piece can be given to a number of officers, say, as follows:—

	Rs.	
Sub Divisional Officers.....	2000	each
Circle Officers.....	2000	"
Selected Dy. Magistrates...	2000	"

Total Rs 12000 to 15000

absolute discretion being given to the officers to spend the money supplemented by local contributions in money and kind, i. e., day-labourers of the village contributing by labour, &c., as best and profitably as they can and according to their own ideas, initiative, local influence and tact. A fixed local area is to be allotted to each such officer. More visible and definite results can be achieved in this way in one season than has been actually done in the last several years.

13. This perhaps is not a very large order—Rs 12000 for the Formosa scheme and Rs. 10000 to 15000 for tanks, considering the vast interests at stake in each district. In fact, a substantial sum is being spent in many districts every year on mere quinine distribution with no visible effect. The malaria doctors generally are on quick march over this district—not being

allowed to stay more than a day (so I hear) in one place.

Can we expect any definite results from such indefinite and random lines of work? That is the point for us to solve. Rs. 30,000 spent in one small district on anti-malarial work of the kind hitherto practised may look quite a respectable success on paper. But in reality is it worth repeating from year to year? It is making little or no impression upon malaria, which is rampant as ever and it behoves us, the Government and the people, to try a more definite and more localised line of work, if we are for definite results.

14. I submit my scheme for consideration by all concerned for whatever it may be worth. We Indian officers are of the people and of the Government. Our opportunities for knowing the exact needs of the people and doing good to them are unique and many a good thing is missed if we forbear to speak out the right word at the right moment. Good thoughts, like true needs, are bound to fructify some day in some congenial soil.

15. The anti-malarial campaign will comprise:—

(1) Combined Formosa and Dinajpur scheme, namely, blood examination and spleen census—followed by a regular and systematic course of treatment—not merely making the patients swallow quinine tabloids—as at present—irrespective of the attendant complications of the individual cases.

(2) Reclaiming old tanks and reserving at least one in each village for drinking purposes,

(Jungle clearance and improved drainage around habitations of men can be undertaken as far as possible with the voluntary aid and co-operation of the people concerned. Anything very definite may not be possible at once)

The processes (1) and (2) will go on hand in hand in the selected area.

16 The unit, experimentally, may be a group of 10 or 15 villages or about the size of a chaukidari union. The village in India from ancient times has been an indispensable unit in the social fabric and the starting point of public life. In all matters of vital reform of a wide-spread and far reaching character, it is, therefore, but the natural process in India, to build from the village unit upwards.

Given distinct funds, a definite programme

of work in a definite area and a capable organiser with a free hand at expenditure (however humble the allotment may be)—a definite advance is bound to follow much quicker than by the reverse process of beginning from the top downwards.

It is time that a definite practical move, however humble, in right earnest, were made to demonstrate the potentialities of the true ideal of local self-government—so much written and talked about, which we are pledged to let our people participate in.

17. There is no end of the subjects, which, to carry local self-government to its natural logical sequence, could be taken up by a local union in due course. Its possibilities are immense. As an experimental measure, along with anti-malarial treatment on the Formosa *cum* Dinajpur plan and reclamation of tanks, we can take up the following work in hand :—

(1) Introduction of new crops, better seeds, improved cultivation, manuring and irrigation—in practical compliance with the recommendations of the Agricultural Department (only known results of the Department, not mere experiments).

(2) Establishing seed, manure and implement depots.

(3) Forming Co-operative Credit Societies and organisations such as purchase and supply societies—thereby fostering the practical application of the co-operative principle to Agriculture.

(4) Expansion of primary education.

(5) *Salish Sabha* (Arbitration Board) for amicable settlement of petty disputes.

18. These items will furnish enough material for a continuous constructive programme of useful work for a number of years to come. The ideal as thus outlined will appear to be sufficiently inspiring and stimulating to any zealous Government Official or public-spirited man of the country who is for real substantial progress. But, it is very different from that of the union committees that are being started here and there, which are only miniature rural editions of the town municipalities with the necessary evil of fresh taxation and the harassments due to bye-laws and regulations as to latrines, jungle clearing, ditch filling, &c., without any tangible extra benefit felt by the people in the matter of agricultural and co-operative progress, drinking water, medical aid or education.

19. For the present, i.e., during the

experimental stage, the control and direction of the operations will rest with a Gazetted Executive Officer assisted by the local panchayet. In fact the success of the scheme will virtually depend upon his power of initiative, control and organisation—in a word, his personal magnetism. He will have to be inspired by a love for the cause himself and to instil enthusiasm and confidence in the people among whom he will work. He will have to work in hope and faith and with the fervour of a religious conviction to make the scheme a success and not mechanically as in ordinary office routine business.

A beginning, however modest, can be made in every district with one typical area to start with, and any one of the Deputy or Sub-deputy Collectors on the ordinary district staff can supervise the work in addition to his duties under the supervision of the collector.

A spirit of emulation and healthy rivalry will spring up between district and district as to which can show, at the end of a year, better results as to the number of malaria cases thoroughly treated on the Formosa *Cum* Dinajpur plan, tanks reclaimed and reserved, co-operative societies organised, crops, manures and implements newly introduced, primary schools started, cases amicably settled and so on.

20. At present, Executive and Revenue officers generally, and District officers particularly, suffer from want of a definite scheme of work or a sufficiently inspiring and attractive ideal before them mixed up with true and real popular good which they can work for, live for, strive for; and, there is no fixed index of progress by which to judge of the comparative results of different district administrations and thereby weigh the comparative merits of different officers.

The number of cases disposed of, witnesses examined or the volume of correspondence dealt with, processes served, &c., are of course a testimony of hard and good work, but these touch but the fringe of the real administration which is concerned with the promotion of real beneficent measures affecting the mass of the people, and in this respect, something like a positive turn in the angle of vision would not be unwelcome.

21. The scheme can be named, with His Excellency's kind permission, "The Carmichael Scheme of village reform in

Bengal" and it would be a marked event in Bengal's history if the first seeds of true local self-government as sketched out in Lord Ripon's memorable Resolution of 1882—were to be sown broad cast (may be but one tiny seed in one district) by the hand of the first Governor of the Province.

22. As for malaria in Birbhum, a Sanatorium at one time, but now so bad, in fact, the worst in Bengal to judge by mortality, the Sanitary report for the District is a melancholy reading. 38000 people died of malaria alone in this small District, last year, or 40 per mille as against 26000 of the year previous, or 27 per mille; and over 33000 people have already fallen victims in the 11 months from 1st January last to November. In other words, in these three years, a lakh of people out of 9 have been carried away by malaria alone.

23. Malaria deaths are not like those from cholera or plague, the work of a few hours. There may be sudden and quick deaths due to the special virulence of an attack, particularly among infants. But the usual course of the malady is a process of slow torture and death by degrees. The malarial parasite enters the system, and establishes a comfortable abode there. There is none to molest it. There is no blood examination and no thorough dose of quinine treatment within a certain stated period (I believe, it is 80 grains for an adult in 48 hours time or something like that). If that were done at the early stage, the parasite would be killed and the person would have a fresh lease of life. Perhaps, with careful living and a regular mild prophylactic dose of quinine twice a week or so he would altogether be immune for the rest of his life. But, no, that is not to be. He is but a poor, though sturdy, rustic toiling in the fields in the nook of a hamlet 20 miles away in the interior. None to examine his blood, or, to wait, halt and see to his taking the quinine for 2 days in the prescribed dose. A flying doctor comes but he is on quick march and can not and does not tarry.

24. The parasite starts its work, fever every now and then, want of digestion, languor, &c. The man becomes half useless in one season. The parasite goes on developing unchecked, and what was benign tertian becomes 'malignant' the following season. Enlargement of the spleen, derangement of the liver, anæmia,

&c., now set in, besides fever as usual, oftener and more and more virulent in its attack. The man by this time has become more dead than alive, a miserable distortion of his former robust self. He is now oftener in bed than upon his legs. By this time, he has lost all self-help and self-confidence and has resigned himself to the worst. Not to speak of proper nursing, even if there were proper medicines (mere quinine tabloids will no more do) at his door and the medicines dispensed to him, there and then, free or at cost price where one has the means to pay, his life would be saved. That would also serve as an inspiration to others to try to live and fight malaria, not resigning oneself to fate, as is happening now-a-days.

The simple malarial attacks of this year will develop into malignant cases next year and it is these latter which swell the death roll unless we can nip them in the bud this year. Not that a sudden virulent type of malaria or an epidemic wave has come over the land. The malaria poison is there, as perhaps in every other country. It becomes more or less pronounced before public notice, according as remedial treatment is resorted to or not by the people. This accounts for the fact that malaria is not confined to one particular locality or any particular class of people. The localities which showed most deaths last year or the year before are not the ones showing the same this year.

25. Our new line of work can be as follows:—

Blood examination and spleen census will show which are "early" or "first stage" cases, and which are 'ripe' or "advanced" cases. The two classes of cases will be sorted apart and will be separately registered and treated. For the first, quinine tabloids in proper doses and for the other class, which are the cases usually turning fatal, a regular course of treatment must be arranged and the medicines dispensed at convenient centres.

26. Any how, for want of a systematic course of medical examination and medicine supply, costing Rs 12000 or Rs 15000, we lost 38000 of our men last year and about the same number this year. The majority of them would have survived with proper treatment. In other words, human lives went so cheap as 3 for a rupee, and the same is

arouse some definite activity on better lines this year and in the years to come.

Suri, Birbhum. Deputy Magistrate

THE CYCLE OF SPRING

VAIRAGYA-SADHANA.

Dramatis Personae

CHANDRAMAS The favorite of the party who represents the charm of life.

DADA Elder Brother) The wise man of the party. He checks and controls and is the spirit of prudence.

A FERRYMAN, A WATCHMAN, and others.

WINTER and his party.

Musical Prelude to Scene I.

The Bamboo sings :—

I stand a-tiptoe, watching by the
wayside

to be startled by your first whisper,

by the music of your foot-steps,
a flutter of joy running through my
leaves, betraying my secret.

PHALGUNI:

A play, in which it is conclusively proved to the satisfaction of all and sundry that the New is the repetition of the Old; the first scene of which is named Outburst, the second Search, the third Doubt, and the last Discovery. Each scene is approached through a musical prelude.

The Bird sings :—

The sky pours light into my heart,
 my heart repays the sky in songs.
 I pelt the South wind with my notes.
 O blossoming *palash* (flame of the
 forest),
 the air is a-fire with your passion,
 you have dyed my songs red with
 your madness.
 O *Sirish* you have cast your perfume-
 nets wide in the sky,
 bringing up my heart into my
 throat.

The blossoming Champak sings :—

My shadow dances in your waves,
 everflowing river.
I, the blossoming Champak, stand
 unmoved on the bank
with my vigil of flowers.
My movement dwells in the stillness
 of my depth,
in the delicious birth of new leaves,
in flood of flowers,
in unseen urge of life towards the
 light ;
its stirring thrills the sky, and the
silence of the dawn is moved.

SCENE I.

A band of youths have come out seeking adventure. The Wise Man of the party must have listeners for his quatrains full of sound advice. But the good words are lost on these wild spirits, and laughter and recklessness prevail. Then enters their leader, of undying youthfulness, who shall be nameless in this play. He laughs at them when they make mention to him of The Old Man. They accept his challenge to bring The Old Man captive for their spring festival.

Musical Prelude to Scene II.

Spring's heralds try to rob winter of his outfit of age.

They sing :—

We are out seeking our play-mates,
waking them up from every
corner before it is morning.

We call them in bird-songs, beckon
 them in trembling branches,
 we spread our enchantment for
 them in the sky.
 You shall never escape us, O Winter !
 You shall find our lamp burning even
 in the heart of the darkness you
 seek.

Winter sings :—

Leave me, Oh, let me go.
I am ready to sail across the South
Sea for the frozen shore.
Your laughter is untimely, my
friends.—

you weave with my farewell tunes
your song of the new arrival.

Spring's heralds sing :—

Life's spies are we, lurking in all places.

We have been waiting to rob you of
your last savings of dead leaves,
scattering them in the South
Winds.

We shall bind you in flower-chains
where Spring keeps his captives,
for we know you carry your
jewels hidden in your grey rags.

SCENE II.

The band of youths gaily set forth seeking the Old Man. They question the Ferryman about him, but he only knows of the way and not of the wayfarers. They question the Watchman and he says his watch is at night and passers-by are shadows to him. He warns them against their fools' errand. All the information they get is that the Old Man is seen only from behind and never in front. In the meantime the Ferryman and the Watchman are happy in the company of the quatrainer. They take him to be profoundly wise, his verses being supremely trite.

Musical Prelude to Scene III.

Winter is being unmasked, his hidden youth about to be disclosed.

Spring's heralds sing :—

How grave he looks, how laughably old,
how seriously busy with the pre-
parations of death!

But before he reaches home we will
change his dress and his face shall
change.

We will confound his calculations,
snatch away his bag, bulging
out with dead things,
and there shall be unveiled the
reckless and the young in him.

They tease him and sing :—

O the time comes, it has come,
when he shall know that he is our
own,
when the mad torrent shall be un-
loosed from the miserly grip of
the ice,
and the north wind in its ring-
dance shall turn round.
O the time comes, it has come,
when the magic drum shall be
sounded,
when the sun shall smile at the
change of your grey into green.

*There enter a troupe of young things
and they introduce themselves in a song as
follows :—*

Again and again we had said, "Good
bye,"

never hoping to return.
Again and again we come back at
the gate.

"O who are you?"—
"I am *Vakul*!"

"And who are you?"—
"I am *Parul*."

"And who are these others?"—
"We are mango-blossoms landed on
the shore of light."

We shall smile and leave when our
time comes,
for we know that we throw our-
selves into the arms of the
Never-ending.

"O, who are you?"—
"I am *Shimul*."

"And who are you?"—
"I am *Kamini*."

"And who are these others?"—
"We are the jostling crowd of new
leaves in the *Sal* forest!"

SCENE III.

The day wanes. The young travellers are tired, their faith in the Leader wavering. They fear they cannot trust what is before them, that they can lean only upon what is behind. They are almost in that desperate mood when men sit down to compose quatrains full of wise maxims. There comes Chandrabas, the favourite of the party, with a blind singer to direct him in his pursuit. The singer can see with his all, not having the distraction of eyesight. Chandrabas makes ready to enter the cave to capture The Old Man.

Musical Prelude to Scene IV.

Winter is revealed as Spring. Thus follows his confession to his tormentors:—

"Do you own defeat at last at the
hand of youth?"

"Yes!"

"Have you in the end met the Old
who ever grows new?"

"Yes!"

"Have you come out of the walls
that crumble?"

"Yes!"

"Do you own defeat at last at the
hand of the hidden life?"

"Yes!"

"Have you in the end met the Death-
less in death?"

"Yes!"

"Is the Dust driven away that steals
your City of the Immortal?"

"Yes!"

SCENE IV.

Chandrabas has disappeared in the cave. His party are deep in doubt and despondency. Chandrabas suddenly re-appears from the cave and his friends are happy again. They ask him of his quest. He bids them wait for the Captive who is to follow him soon: When to their astonishment the Leader himself comes out of the cave fresh and young and the Old Man is nowhere.

Spring's followers surround him and sing :—

Long have we waited for you, beloved,
watching the road and counting
days.

And now April is a flower with joy.
You come as a soldier boy winning
life at death's gate.

O the wonder of it !

We listen amazed at the music of your
young voice.

Your light mantle is blown in the wind
like the odour of spring blossoms.

You have a spray of *Malati* flower in
your ear.

A fire burns through the veil of your
smile,—

O the wonder of it !

And who knows where your arrows
are with which you smite death !

The Wise Man comes with his last
quatrain, which runs as follows :—

The sun stands at the gate of the
east, his drum of victory sounding
in the sky.

The night bows to him with her
hands on her heart and says,

"I am blessed, my death is bliss."

The Darkness receives his alms of gold,
filling his wallet, and departs."

They all sing :—

• Come and rejoice !

for April is awake.

Fling yourselves into the flood of
being,

bursting the bondage of the past.

April is awake.

Life's shoreless sea is heaving in the
sun before you.

All the losses are lost and death is
drowned in its waves.

Plunge into the deep without fear
with the gladness of April in
your blood.

THE INDIAN NATIONAL CONGRESS—A NEW CHAPTER

"THE last was the first Congress of the New Era, of the New India,—the India of the young, of the hopeful, of the energetic." This is how Mrs. Annie Besant has described the 30th session of the Indian National Congress which met in Bombay less than five weeks ago, and the description truly represents the opinion of the bulk of the delegates who had the pleasure and the privilege of attending it. Really the last session of the Congress marks a landmark in the onward and progressive history of the Indian National movement.

During its inception and the first two years, the Indian National Congress flourished under gubernatorial patronage and basked under official sunshine. At the end of the second Congress in Calcutta, a large number of the delegates were treated to an afternoon party at Govern-

ment House, then the winter residence of the Viceroy of India. Next year, fortunately for the Congress, Lord Dufferin fell out with Mr. Allan Octavian Hume, the inspirer and founder of the movement, and we were treated to an exhibition of Viceregal temper in a notorious post-prandial utterance, the memory of which is still lingering this day. This opened a new chapter in the history of the Congress, and from 1888 on to the beginning of the present century, no end of ridicule and banter had been levelled against it. In Parliament, long before the last century came to an end, Mr. Goschen went out of his way to throw a very broad hint that the Congress was being fed and financed practically by the Russian rouble (the German bogey had not yet then come into vogue); and in India, between Sir Auckland Colvin and the late Rajah of

Benares, Sir Syed Ahmed, Odey Pratap Singh of Bhinga, Rajah Siva Prasad and their worthy lieutenants, an impression was widely created in the public and official mind that the Congress was a very disloyal and seditious movement. This attitude of distrust was reflected in the deliberations of the Congress itself and by the secession from it of practically the whole of the Mahomedan community: and as a result, the main attention of this body was for several years concentrated in rebutting official statements, protesting against legislative measures and animadverting upon bureaucratic rule and official high-handedness. The Presidents of the Congress for this period hardly ever looked very much ahead or concerned themselves with any constructive programme of work. They bitterly declaimed against the spirit of the administration and criticised none too mildly all anti-popular legislative enactments. There were, however, exceptions to this, as George Yule (Allahabad, 1888), Ananda Mohan Bose (Madras, 1898), Sir Henry Cotton (Bombay, 1904) and Gopal Krishna Gokhale (Benares, 1905) introduced into their speeches such other matters as will be read with attention and respect by all students of Indian politics for a long time to come. The speech of Mr. Surendranath Benerjea in Poona in 1895 and of Sir Sankaran Nair at Amraoti in 1897 were also very notable utterances, the first for its oratorical flourishes and brilliant delivery and the latter for its quiet strength and incisive criticism. This went on till December, 1906, when Mr. Dadabhi Naoroji laid down *Swaraj* as the ideal of the Congress. Over this word *Swaraj* and the various interpretations that were sought to be put upon this ideal, Congressmen in India split themselves up into the moderate and the extremist wings, and then came to blows at Surat in 1907. This again ushered in a fresh period in the history of this movement.

From 1908 to 1914, the Congress passed through a stage of great depression. The two wings of the Nationalist Party remained separated all this time by internal dissensions, while the Government took advantage of the blazing indiscretions of some of our countrymen to create new fetters for the people. At the top of all this came the *bomb*, which brought to a head the spirit of distrust cherished by a certain class of

our people against British rule and opened the official eye to the realities of the situation and the bitterness of our grievances. While the Administration got nervous over what came to be known as the Indian Unrest, thanks to the intrigues and enterprise of the Northcliffe Press in England and to the literary activity and the personal influence of Sir Valentine Chirol and his friends, Lords Morley and Minto were endeavouring to the best of their light to rally the moderates. The feeling of the rulers and the ruled got again very much strained as the unrest came to be magnified and as the Morley-Minto reforms failed in a large measure to placate the better mind of the people. The address delivered by Pandit Bishen Narayan Dar as the President of the 26th Congress in Calcutta reflected in a very able and pointed manner the disappointment and bitterness of the educated community in India at the new official policy of repression and reaction.

At Bankipur and at Karachi (1912 and 1913), the Congress had very uneventful sessions and went off in a very hum-drum way: and when it met for the 29th session at Madras, the European war had broken out and the attitude of our people appeared to have dispelled distrust and want of confidence. Mr. Bhupendranath Basu availed himself of this opportunity to introduce a healthy departure in the tone of his Presidential address at Madras in December, 1914, and raised a cry for self-government in this country and a satisfactory adjustment of the relation of India with the British Empire. For the first time in the history of the Congress, controversial politics and discussions of administrative and legislative measures were practically avoided in the inaugural address of the President and an altogether higher plane was reached. At this Congress also, the proposals of a compromise between the right and the left wings of the Nationalist Party reached a definite stage and were referred to a Committee, and signs were not wanting of a complete *rapprochement* between the two great communities of the Indian people—the Hindus and the Mahometans. The session of 1914, however, was the close of the period of depression, and it was felt by most Congressmen who attended it that a new chapter of its history would open with its 30th session in Bombay in December, 1915.

The expectations of Congressmen in 1914 have been more than realised in the Congress of 1915. Not only have the two main wings of the Nationalist Party been reconciled to each other by a happy compromise, but for the first time in the history of India have the Hindus and Mahometans met in a common political platform to work out their common destiny, thus giving the Congress a truly representative and national character. And to crown all, there was the unique message of its President which, for boldness of conception, courage of expression, and statesman-like wisdom, will remain for a long time as one of the most remarkable utterances of our day.

I shall now take the liberty to discuss at some length the message conveyed by Sir Satyendra Prasanna Sinha to the last Congress in Bombay. Sir Satyendra sums up our political ideal in one word—'self-government'—but, unlike most of our public men, he keeps us neither in the dark nor in doubt as to what he exactly understands by this word. While there has been a good deal of wobbling over 'self-government' as may be applied to India, Sir Satyendra defines his own idea of it by quoting President Lincoln's famous dictum—"Government of the people, for the people and *by the people*." By 'Government', again, Sir Satyendra does not mean the civil administration and the legislative function of the State only, as is *generally* understood by the bulk of our people, but all the controlling agencies "civil as well as military, executive as well as judicial, administrative as well as legislative." In Sir Satyendra Prasanna Sinha's scheme of Self-government military control and 'the nationalisation of the army,' enter as effectively as popular control over legislation and administration. The question of enlistment and commissions in the Army, with their logical corollaries of universal volunteering and the removal of the hard provisions of the Arms Act, is as much practical politics to Sir Satyendra as the separation of the judicial and executive-functions. Such an ideal of self-government, I beg leave to point out, has hitherto been never held up to us. In the earlier periods of the Congress, we had prayed and agitated for the expansion of the Legislative Councils and the repeal of this Act and that; latterly, we pressed for the full and satisfactory development of local

self-government and further control and share in the actual administration of the country. In the 30th session of the Congress, our President put forward no detached and isolated claim for this or that privilege, this or that right, the abrogation of this Act or that, but the all-inclusive claim of control, *by the Indians themselves*, "over the civil as well as the military, executive as well as judicial, administrative as well as legislative" branches of government. That is the highest ideal that the people of India may aspire to and no President of the Congress has put it so frankly and so courageously as Sir Satyendra Prasanna Sinha has done.

Defining his self-government as we have put it above, *government by the people* both civil and military, of course Sir Satyendra Prasanna was obliged to say that the goal was *not yet*. Who is there among us who understands what 'government by the people' really means as would suggest that such a goal is *attainable* in India either to-day or to-morrow? Even assuming the very large proposition that we Indians are to-day *fit for everything*, who would for the matter of that, be handing the government of this country to us *to-day* to be managed by indigenous agency alone? Also assuming that we are fit today to protect ourselves from internal strife and external aggression without having undergone military training of any kind whatever, who would take the risk to ask the English to withdraw from India immediately and leave the whole thing to us as a huge experiment? I really cannot see how any man with a grain of common-sense can ever question the soundness of Sir Satyendra's position in this matter. The sort of self-government that Sir Satyendra wishes and hopes for is, certainly *unattainable to-day*, unless, of course, we are able to expel the British out of this country by a conflict of arms. And "India, freed from England, but without any real power of resistance," says Sir S. P. Sinha, "would be immediately in the thick of another struggle of nations." Therefore, one must agree with him in thinking that the time for the realisation of the ideal preached by him is *not yet*, and that there is really 'a wide gulf between the desire and the attainment.'

Unfortunately for Sir Satyendra, as well as for the Congress, a large number of Indian publicists have not really compre-

hended his meaning of self-government, confounding it with the power to have greater control over the administration of the country and the establishment of popular control in the various Legislative Councils, and Municipal and District Boards. Then again, they have confounded his words, that the goal is not yet, with the questions of our fitness for self-government. Nowhere in his very closely-reasoned speech has Sir Satyendra ever denied the fitness of his countrymen for self-government. On the contrary, he himself lays stress upon this fitness in two places in his Address. For the edification of the Indian reading public, I will quote below these passages.

"The Bengali is just as anxious to fight under the banner of His Majesty the King-Emperor as the Sikh and the Pathan, and those of them to whom an opportunity has been given to serve either in ambulance, postal or despatch work, have shown as great a disregard of danger and devotion to duty as others employed in the more arduous work of fighting. India has risen to the occasion, and her princes and peoples have vied with each other in rallying round the imperial standard at a time when the enemies of the Empire counted on disaffection and internal troubles. The spectacle affords a striking proof as much of the wisdom of those statesmen who have in recent years guided the destiny of the British Empire in India as of the fitness of the Indian people to grasp the dignity and the responsibilities of citizenship of a world-wide empire."

"I take leave to point out that it is not correct, at any rate at the present time, to assert of any sections of the Indian people that they are wanting in such physical courage and manly virtues as to render them incapable of bearing arms.....If the Sikhs, the Gurkhas, the Mahrattas, and the Pathans—good and valiant soldiers as they are—are found to be loyal and law-abiding, *there is no reason to think that the case would be otherwise with the other races when admitted to the same status and privileges.*"

I think the above extracts will give an effective quietus to those critics who have been sedulously trying to create the impression that Sir Satyendra Prasanna Sinha has proclaimed Indians unfit for self-government. People have confounded, in the first place, his ideal of self-government with only an apology for it in the shape of popular control over the civil administration and the legislative function of the State and then, in the second place, his limitations of time with the question of our fitness. And even on the point of time for the attainment of our goal of self-government, Sir Satyendra is not equivocal or impractical.

"When we ourselves," says Sir S. P. Sinha, "have so far advanced under the guidance and protection of England as to be able not only to manage our own

domestic affairs, but to *secure internal peace and prevent external aggression*, I believe that it will be as much the interest as the duty of England to *concede the fullest autonomy to India.*"

Then again:—

While we admit that the goal is not yet, we refuse to believe that it is so distant as to render it a mere vision of the imagination. We deprecate the impatience of those who imagine that we have only to stretch our hands to grasp the coveted prize. But we differ equally from those who think that the end is so remote as to be a negligible factor in the ordinary work of even present-day administration."

Be it noted here that Sir Satyendra does not pray for self-government as a part of the policy which a few years ago used to be described as the 'mendicant' one, for he says that self-government as a 'free gift from the British people is *not* worth having,' as nations, like individuals, *'must grow into freedom.'*

This enunciation of our ideal is manly, heroic, and has nothing undignified about it: nor has it anything to do with the 'whining or mendicant policy' with which the Congress used to be taunted at one time by men of the extremist school. Sir Satyendra does not believe in boons or concessions, or in royal roads or short-cuts either. He says how and what he feels, for, in the words of Edmund Burke, he would 'sooner take the risk of displeasing than injuring his countrymen.' He has, therefore, no hesitation whatever in advising his countrymen to *win* self-government by "patient preparation and silent and unobtrusive work in every aspect of our social and political life."

The enunciation of the ideal and the means to attain it, as explained above, show unmistakably a clear head, a courageous heart and an infinite fund of common sense. Sir Satyendra really deserves well of his countrymen for having taken up such a definite and independent stand on behalf of the Congress and bringing such an ideal so close to us.

Having dealt so far with the main argument of Sir Satyendra Prasanna's address—and Sir Satyendra does not concern himself with any other subject but self-government and the things that lead to it, directly and indirectly,—it remains to be seen whether he stops short at the mere enunciation of the ideal and does not proceed further. It has been suggested in some quarters that Sir S. P. Sinha's plea for self-government is academic, halting and hesitating, as he does not suggest any scheme of practical

reform that might pave our way towards the ultimate goal. This is *not* true, as Sir Satyendra goes beyond most of the past Presidents of the Congress in suggesting what the Government might do for us and what we might do for ourselves. Before proceeding to set out Sir Satyendra's suggestions for political and military reforms, it is necessary to point out that he wants a definite impetus to be given to agriculture, to widen the field of co-operation, to develop local self-government, and to see a system of free and compulsory elementary education established in this country. He wants the Government to abandon the *laissez faire* doctrine that the development of commerce and industry is not within the province of the State and desires it to follow in the foot-steps of Japan by pioneering, promoting and protecting Indian industries, *even by sacrificing British interests*. All this may be a very large order, but as the President of the Congress, Sir Satyendra was only voicing the wishes and aspirations of the Indian People and a truer and sincerer spokesman of his people it would be difficult to find in our day.

While urging active measures to fight with ignorance and poverty and anxious to ameliorate by all manner of means the condition of the nation which in the words of John Bright, dwells in the cottage, Sir Satyendra is not behind anybody in insisting upon political reforms which are so near to the heart of every Congressman. Pending the ultimate attainment of our goal, Sir Satyendra puts all our immediate demands in a nutshell:

"I ask that *steps* should be taken to move towards self-government by the gradual development of popular control over all departments of Government and by the removal of disabilities and restrictions under which we labour both in our own country and in other parts of the British Empire."

Lest there may be any mistake as to the *steps* that may commend themselves to the minds of patriotic Indians, Sir Satyendra does not stop short with the mere enunciation of a general proposition. He himself suggests what these *steps* should be:—

"A decisive advance towards provincial autonomy, the liberalisation of the Council Regulations, establishment of elective as opposed to non-official majorities, an increase of their powers of control, specially in regard to finance, a larger representation of Indians in the various Executive Councils as also in the Council of the Secretary of State, the admission of larger numbers of Indians to all the higher branches of the public services, the long-delayed separation of judicial and executive functions, the expansion of primary, scientific and technical education, the aboli-

tion of indentured labour and the improvement of the position of Indians in other parts of the Empire."

Then, in another place, he returns to the subject and says:—

"We shall continue to urge enlargement of the powers and modifications of the constitution of the Legislative Councils. We shall continue to ask for larger and yet larger admission of Indians to the higher ranks of the public services in all its branches and we shall claim these not as mere concessions but as a gradual fulfilment of solemn pledges for the *progressive nationalisation of the government of the country*."

I shall desire all Indian publicists to note the quiet strength of the words I have put in italics in the above extract.

Not content with mere legislative and administrative reforms, Sir Satyendra goes much further and demands the Government to recognise our claims for admission into the army and to throw its commissions open to all our people. He says:—

"1st. We ask for the right to enlist in the regular army, irrespective of race or province of origin, subject, however, to prescribed tests of physical fitness.

2nd. We ask that the commissioned ranks of the Indian Army should be thrown open to all classes of His Majesty's equal subjects, subject to fair, reasonable, and adequate physical and educational tests, and that a military college or colleges should be established in India where proper military training can be received by those of our countrymen who will have the good fortune to receive His Majesty's Commission.

3rd. We ask that all classes of His Majesty's subjects should be allowed to join as volunteers, subject of course again to such rules and regulations as will ensure proper control and discipline, and

4th. We ask that the invidious distinctions under the Arms Act should be removed. This has no real connection with the three previous claims, but I deal with it together with the others as all these disabilities are attempted to be justified on the same ground of political expediency."

It may be noted here, in connection with the above demands, that Sir Satyendra believes that India was never *conquered* by England in the literal sense of the word and therefore he cares precious little for the Anglo-Indian shibboleth of India being 'won by the sword and retained by the sword.' But that's another story.

In the enunciation of our political ideal which at once commends itself to the heart as well as the head of every sensible and patriotic Indian and in pressing for the reforms we badly want, Sir Satyendra, instead of compromising in any way "the rights and best interests, the honour and dignity" of his country, has advanced her cause beyond any reasonable calculation. Montesquieu, De Tocqueville and the French Cyclopaedists have all expatiated upon the necessity and virtue of every

nation having a high political ideal, and I have yet to know the Indian patriot who could put India's political ideal with greater courage and wisdom than was done by Sir Satyendra Prasanna Sinha at the last Congress in Bombay.

Even in incisive criticism, Sir Satyendra yields the palm to none. The following extracts will show beyond doubt that he is as keen-witted in suggesting reforms as in finding fault.

I feel that hitherto the Government has not only ignored but has put positive obstacles in the way of the people acquiring or retaining a spirit of national self-help in this the most essential respect (defence of one's own country).

The reforms so far effected have not yielded any real power to the people either in the Imperial or in the Provincial Councils.

Does any reasonable man imagine that it is possible to satisfy the palpitating hearts of the thousands of young men who, to use the classic words of Lord Morley, "leave our universities intoxicated with the ideas of freedom, nationality and self-government," with the comfortless assurance that free institutions are the special privilege of the West?

Rich in all the resources of nature, India continues to be the poorest country in the civilised world. And there can never be political contentment without material prosperity shared by all classes of the people.

There can be no true sense of citizenship where there is no sense of responsibility for the defence of one's own country. "If there is trouble, others will quiet it. If there is riot, others will subdue it. If there is danger, others will face it. If our country is in peril, others will defend it." When a people feel like this, it indicates that they have got to a stage when all sense of civic responsibility has been crushed out of them, and the system which is responsible for this feeling is inconsistent with the self-respect of normal human beings.

While the humblest European and Eurasian and even the West Indian Negro has the right to carry arms, the law of the land denies even to the most law-abiding and respectable Indian the privilege of possessing or carrying arms of any description except as a matter of special concession and indulgence, often depending on the whim and caprice of unsympathetic officials.

You may get better value for your money by getting as your soldier an Afridi or a Pathan or any non-British subject, but by excluding the Bengali, the Parsi or the Madras, you create a feeling of grievance, if not of actual resentment, which is certain to cause serious embarrassment in the work of general administration. You render it impossible for the excluded classes to consider themselves as equal subjects and citizens responsible for the defence of the country, and you fail to foster that spirit of self-help and that sense of self-respect among these classes which is essential to attain the goal of imperial unity.

We are seeking to regain our lost self-respect, to defend our homes and hearths against possible invaders, should the strong 'protecting arm of England be ever withdrawn from our country. It is no mere sentiment that compels us to demand this

inalienable right of all human beings, though sentiment has its undoubted place in the scheme of every government. Some day or other, our right arm may be called upon to defend all that man holds most precious.

A superman might gloat over the spectacle of the conquest of might over justice and righteousness, but I am much mistaken if the British nation, fighting now as ever for the cause of justice and freedom and liberty, will consider it as other than discreditable to itself that after nearly two centuries of British Rule, India has been brought to-day to the same emasculated condition as the Britons were in the beginning of the 5th century when the Roman legions left the English shores in order to defend their own country against the Huns, Goths and other barbarian hordes.

I am afraid I have surfeited your readers with extracts from Sir Satyendra Prasanna's Address. But it is difficult to resist the temptation of placing before them the last sentence of it which sums up in very glowing words the creed of the Congress.

"It seems to me that, under the benign dispensation of an inscrutable Providence, we shall emerge into a new era of peace and good-will, and our beloved Motherland will occupy an honoured place in the Empire with which her fortunes are indissolubly linked, and we shall be the free and equal citizens of that great Empire, bearing its burdens, sharing its responsibilities and participating in its heritage of freedom and glory as comrades and brethren."

Now, I shall turn to another aspect of the last Congress. Some of us have been crying ourselves hoarse since a long time to give to the Congress a constructive character in addition to its demonstrative and deliberative functions. Our voice was so feeble that at one time we thought it was no good crying in the wilderness. Not that the Congress had always neglected useful propagandist work, but our complaint was that such work was never undertaken in India. The earlier Congressmen were obsessed with the idea of political 'boons,' and so they had set their heart on educating public opinion in England and interesting members of Parliament in the affairs of this country. They had, therefore, established a permanent committee and an organ in England for the purpose of discussing Indian topics and ventilating Indian grievances and had, on several occasions, sent out deputations to England to agitate over some or other important Indian questions. The public mind of India to-day may not have lost faith in our work in England, but it is awakening to the fact that unless we undertake some work ourselves in *this* country, both educative and propagandist, the Congress will have soon outlived its usefulness. The conviction seems to be

gaining ground that unless we can carry the masses with us, no amount of wire-pulling in England will enable us to achieve our object. So we want education and sanitation to be spread very widely among our rural population, and, if the Government will not do it as quickly as we want it to, we must ourselves step into the breach. Sir S. P. Sinha truly observes:

"Primary education, improvement of agriculture and industrial expansion, improvement of rural as well as urban sanitation—there is work enough and to spare for every one of us. And how much could we not do by our own efforts if only we cared to organise ourselves."

He wants the Congress to be converted into a fertilising stream of steady effort and is anxious to work throughout the year. "Let us at this Congress," said its President, "wipe out the reproach that moderate Indian opinion only devotes a few days to public business in order to have the right during the rest of the year not to think any more about it." The Congress in Bombay fully

endorsed this view of its President, and in consequence of it we are to have continuous and constructive work from this year, both in England and in India, and in furtherance of this object Sir Satyendra Prasanna has himself started a fund which, I have no doubt, will not only give a fresh lease of useful life to the Congress but will also carry his name down to a remote generation of Indians as one of the truest and sincerest benefactors of the Motherland.

Truly, as I began by saying in Mrs. Besant's words, the last Congress was the first of the New Era, of the New India,—the India of the young, of the hopeful, of the energetic. Providence willing, I hope it will not take us long to realise the ideal held out before us by Sir Satyendra Prasanna Sinha and to restore our Motherland from her present fallen position to her ancient and natural status among the countries of the world.

PRITHWIS CHANDRA RAY.

INDIAN PERIODICALS

In the course of an article contributed to the *Local Self-Government Gazette* for December, entitled

Communal Representation in Local Bodies,

Ghulam Mahmood Sahib Mahajir Khan Bahadur has done a bit of practical and sane talking which should draw the serious attention of Hindus and Mahomedans alike, in fact of all Indians who are desirous of serving their motherland. For the benefit of our readers we cull the most important portion of the article:

The first thing for consideration in this connection is whether there is any analogy between the work done in a Legislative Chamber and at Local or Municipal Boards. In the former, questions of grave importance involving political and administrative changes and affecting diverse interests are brought up for discussion. This condition certainly necessitates a keen watch on behalf of the Muslim community which has therefore to be adequately represented on it; whereas in Local Boards and Municipal Councils, only topics of local interest are discussed, about which there can hardly be any diversity of views. For instance, in matters such as expansion of medical relief, sanitation, repair of roads and tanks and

the like, Hindus and Mahomedans are not likely to entertain opposite views. As enlightened citizens and patriots, they are both equally interested in preserving the health and promoting the prosperity of the extensive areas under their parochial charge, and in using their best energies and efforts for the achievement of this end. The only plea which may possibly be advanced by the Separatists is that it will give them a free hand and scope in the exercise of their religious rights and observances. This is, however, a matter more easily attainable when there is harmony between the two communities than under other conditions. The unseemly quarrels which we hear of at times are entirely due to personal spite brought on by factious spirit on the part of miscreants on both sides. All this will vanish and evaporate the moment there is perfect understanding between their respective leaders. Toleration, good-will and co-operation are the life and soul of good citizenship and sure road to success, while exclusiveness and isolation always create bad blood and engender mutual hatred and contempt which must necessarily lead to serious results. Moreover there are some parts of India where the percentage of Mohomedan population is too small to warrant the grant of separate representation. This condition prevails to a large extent in the Madras Presidency. In such cases, Mahomedan interests are sure to suffer when the feelings between the two communities are not of a cordial nature. This is a serious

condition which it is the duty of every patriotic Mussalman to guard against. Again, in places like Madras where the Hindus and Mahomedans happily live as members of a joint family, and also in places where the tension between them is by no means acute, insistence on separate representation is hardly expedient and can certainly serve no useful purpose.

In the pages of the *East and West* for January Abdur-Rahman Seoharvi makes us familiar with some of the best specimens of

Modern Servian Poetry.

The article under review provides very interesting reading and contains a deal of information. "The Slav literature is a new and wonderful achievement in the cultural history of the world," so says the writer.

The Servian people are a mixture of blond Russian-Goths and brown Northerners. The beginning of the new Servian literature is marked by the epoch of Slavonier Branko Radicevic (1824-1853). He has left behind him poems, the inspiration of which is drawn direct from life. His epic-drama *The Crown of the Black Mountain* is impressed with the intensity of a personal quality and is free from convention and abstraction. His rival and contemporary was Petrovic Njegos (1813-1851). A feverish and unsatisfied restlessness characterizes his art. Later Jovan Jovanovic won wide-spread popularity as poet and Lazar Lazarevic and Sima Matavulj earned distinction as talented writers of epic-prose.

Modern Poetry all over the world has become lyrical. The realist, the impressionist, the symbolist, the futurist, the imagist, the interiorist and the exteriorist are all agreed on the question of form. The literature of Servia has been no exception and has yielded itself to the tendency of the age, and the Servian master-singers have also found their true self in little pieces and small poems.

They do not follow the official academical intellectual school. Their poetry is unconventional, erotic and instinctive. They are rather careless of technique and delight in surprises.

"The greatest representatives of modern servian poetry are Kostic, Ilic, Ducic and Stefanovic."

Kostic has been the greatest master of the Servian language of his time. In his metrics he is influenced by his favourite author Shakespear. Unlike all the other Servian poets who employ French syllabic meters in the making of their verse, he uses a strongly accentuated iambus quantity. He is careless in his rhymes and abruptly begins or leaves off to pair the ends.

The following lines, a true and sad portrait of the sensation-seeker, are auto-biographical. His life-confession is no tale of the joys of love but a halting narrative of unhappy attachments.

OH! FORGIVE ME.

Oh forgive me
Oppressed with the burden of pain
I bend to thee
My word upon it. Nevermore

Will I hold the pen to write
Or the sword to smite
Never—nevermore
Oh forgive me, forgive my eyes—
My eyes that passionately suck
The light from the sun of thy face
But the light from thy revengeful eyes
Blinds my own. Ah me
I can no more see
Nothing—nothing.

Oh, forgive me forgive me
Forgive I beg of thee
I was drunk when I swore
Restore my pen, my sword
And my eyes.

What passionate looks are these?
Oh spare me, spare me yet.

Or——let it be
Gather me then to thy radiant breast
Stille me in thy embrace
Let me sink in kisses
And drink the cup of sorrow
Till I end——
Then forgive me.

About Ilic we read:

Ilic, though he lacked intensely original talent, was no imitator of his Servian predecessors. He took his suggestions from the Continental masters but did not copy them. His poems always contain something of a story or suggest a situation. He draws well but has no eye for contour or colour. He is more literary than artistic and much of him is lost in translation. His outlook on life is subjective. He was precocious as a child and is premature as a poet.

The ideal of poetry Ilic had set up before himself was one worthy of his brave nation. How well he shows in these lines that poets are the trumpets that sing nations to battle.

THE POET.

The chosen of the gods is he
A votary in the temple of Art
He burns the incense of life
On the altar of the muses
His lyre is resonant of love
And none of the tunes of his music
Can ever be false.

A votary devoted is he
Of the goddess of freedom of nations
His message is justice and right.
As storm from the chimney of God
Doth smoke on a windy day
Rises his music divine.

He will live, the crowned of his nation
When all that is transient has passed
And drowned in the dismal ocean
Of centuries arm in arm,
As waves of the mighty sea,
In his utterance unsurpassable alone
Is immortality.

But weak, constitutionally and temperamentally as he was, he could not soar to the height of his own ideal. His poetry, is delicate. He can paint coy maidens and drooping flowers with effect. In general he describes psychological situations but keeps back from pronouncing his own judgment.

The Guest and Doubt are his two characteristic poems. In the first he appears to be a realist, in the second an impressionist. He is in fact none or both.

THE GUEST.

The midnight hour is struck
And the public house is empty of guests
Only the old land-lord of the inn
Turns over the pages of his guest-book
The rain-drops patter against the window-panes
And darkness shrouds the earth.
What-----is there not a knock at the door?
In the tavern uninvited, unexpected,
Enters a strange guest —
Oh, it is Death himself!
That comes to take his seat at this late hour.
The land-lor l sleeps and snores
With the big book on his knee
Death approaches him on tip-toe
And taking a pen lying on the table
Enters his name in the guest-book.

DOUBT.

I found her fair in early days of youth
She was delicate and pale
I loved her, so.
The night was sweet and dark
Alone were I and she
I knew not how and when
Followed me
Doubt.
"Come my way" said he
"How beautiful is truth,
"Let her disrobe herself to thee"
"I search for truth
My way is war and pain
The days are long, the nights are cold
Before me neons rise and fall
The rise of Greece, the fall of Rome I see
But, Doubt, my guide
Doth lead me on.

Jovan Ducic is the great poet of Modern Servia.

He is alive to the fact that his genius is different to that of his contemporaries. He is also conscious of his own greatness. This is his conception of true art.

MY POETRY.

Silent as marble, as shadow cool
Thou art a dreaming maid
Nervous and pale.
To others is song a woman
That sings in streets, unclean,
Harlotwise.
I deck thee not with pearls of glass;
Put yellow roses in thy dark long hair.
Be proud; give thyself to none
And shun the vulgar crowd; be shy.
Thy nakedness is divine,
Clothe it not
Save with the translucent veil
Of mysteries.

Here are two other pretty pieces from the same pen:

THE GLADIATOR.

In midnight silence of the museum hall
Round granite Mars, nude and drunk,
Dances the bauchante.
In endless pain
Cold tears of marble weeps
Niobe.
Laakoon winds himself in serpent rings
Odius insane with rage and fear
Sits on a heavy stone,
All is still,
I hear the moments fall
But no! hallucination
Rings the midnight knell
And in the darkness long and cold
I hear a sigh
Oh here in this very forsaken hall,
Only two thousand years ago,
With sword fine-edged and bare,
Was the heart of a young gladiator
Run through.

LONELINESS.

In the long wood-end a forgotten spot
Laden with stillness, where at night
The waterfall weeps complainingly
And the empty willows sigh
In eternal silence, stands on a fountain-brink
Loneliness, nervous and pale.
She stands there, since when?
Who knows.
The trees around her sigh and from leaf to leaf
Goes the refrain of pain.

About Stefanovic we are told:

The poetry of Stefanovic is didactic and problematic. His national poetry is full of strength but not harsh and heavy. It is war for the sake of the cause, and not for its own sake, that leads the nation to victory and glory. Stefanovic believes in the sure victory of right over wrong. He does not possess the language of the prophets of the Old Testament but can command words of flame at his bidding.

The following great poem explains more than any possible comment the unbreakable spirit of the Servian nation and its earnest resolve to conquer or to die. In these passages there is nothing which a matter-of-fact mind could not have thought out, but it is the privilege of genius alone to arrange and to know what is pertinent and essential.

THE ACCORD OF IMMORTALITY.

Oh soul, is there a happiness so beautiful and pure
As to be able to say to the world
At the moment of entering the House of the Dead
I gave thee all I had.
The cowards alone are afraid of death
Or bondsmen and slaves
"I am the captain of my soul
I am the master of my fate."
Hamlet-wise, I see the game of life,
Death is the brother of sleep,
He who fears his icy heavy touch
Was dead ere he died.
The rivers in their headlong rush
Fall into the mighty sea.
I go to greet the angel of death
Unhesitatingly.

My approaching end with interest I watch
This world crumbles in my sight,
And another is born
I look in and look on.

The living say of us
"The dead are gone and are no more
Time has reaped the harvest of their lives,
On their knees sleeps desolate transitoriness
And pale and airy phantoms alone
Are left in memories here and there."

We know it but otherwise
And laugh at their mad delusion:
"O living. Reflect but for a moment,
Do you believe you have fallen
Like angels, unborn on earth.
Oh men, look at your muscular arms
Your hands that flash the terrible blade;
Oh women, look at your long wild hair
That inmesh the hearts of your lovers,
We have given you your hands
We have given you your hair
You speak with our mouths stopped with dust,
You see with the empty sockets of our eyes
Our youth lives and blossoms in you."

"Why do you adorn our graves with crosses
And put wreaths of leaves and flowers thereon
We do not live in the graves
We live in you, we are you."

"We are ever with you, in waking and dream
Like your shadows never forsake you
And in the wars you wage on time and space
We are the helpers that lead you to victory."

Here is a description of the Servian sunset by Stefanovic.

THE SUNSET.

The sun sinks in all its purple glory
The rays a kingly host
Flee before the forces of the night.

The sunset bow with shafts of finishing light
Opposes the invading forces of gloom,
But the dark-hooded princess comes.

Death the trumpeter
Heralds her car of victory,
My heart is gripped with fear
I see the approaching end.

The last shimmer of light
Flickers and is gone

The Field of Public Health Work

is the title of a thoughtful contribution to the December number of *Local Self-Government Gazette* by George E. Tucker, which contains much that should make us think. The paper though originally read before the League of California Municipalities could have been as well read before the City fathers of Calcutta.

Says Mr. Tucker:

The health and prosperity of the community are dependent upon the health of the people, and a healthy community is prosperous, attracts people and increases the value of property. Public health is pur-

chasable, and within certain limitations, a community can determine its own death-rate.

Health departments are the direct outcome of the knowledge that disease can be prevented. The general prosperity of the state is dependent upon the general health of the people.

Money put into health and sanitation of any character must be regarded as an investment from which definite returns are to be expected, and must not be considered in any sense an unprofitable expenditure.

It has been noted that in the Canal Zone where such wonderful work has been carried on, the death-rate for 1911 among 10,489 Americans was only 4.48 per thousand. This record is a remarkable one and is probably without rival. And all this, says Colonel Gorgas, has been accomplished at an expense averaging one cent per day for each individual. If this result can be secured at this cost in the centre of a tropical jungle, what would not a similar expenditure do for our cities?

Who should constitute a board of health? The writer opines that

The question as to the necessity of a properly trained physician and an engineer on a board of health is seldom argued.

Health boards are concerned with water supplies, sewage disposal, collection and disposal of garbage, street cleaning, tenement-house sanitation, and the solution of these problems requires the services of engineers and it is for this reason that a municipal board of health should have for at least one of its members, an engineer whose judgment may be accepted as final.

Further, representatives on municipal boards of health should be chosen with the idea of selecting individuals who are intensely interested in the very problems which require the services of an engineer, a physician and a financier to solve. A representation of two successful laymen who are in a position to pass judgment on the expediency of proposed reforms are an invaluable assistance in the conducting of municipal health affairs. Usually, the Mayor of a city, in touch with the popular chord and the public purse, becomes a most excellent member. In municipalities where public school inspection has become a fixed institution, as a fifth member of the board, the selection of the inspector might be justifiable.

And the writer thinks that "public health officials must be full time officers and further they must be adequately paid."

Mr. Tucker rightly holds that

The field of public health work is continually broadening until at the present time its relationship to education, the prevention of crime, insanity, blindness and industrial accidents is well established.

If the spread of tuberculosis is dependent upon a low resistance of the people and if the cure of tuberculosis is to a very great extent dependent upon the factors of rest, fresh air and good food, and if it is true, as it seems, that the application of these therapeutic principles assists in bringing about recovery by increasing resistance, why are they not as applicable to healthy persons to maintain health, as they are to unhealthy persons to bring about healthy conditions?

If the open air school building can be constructed for one fourth to one-half the cost of the so-called closed building, and if the children attending such schools show a fifty per cent. increase in efficiency, as statistics indicate they do, and if our tuberculosis school children improve under such therapeutic pro-

cedure, why should we continue to build monuments of brick and mortar for future generations to destroy because of their unfitness from a health standpoint?

The development of adult criminals is oftentimes the result of preventable pathological conditions which should have been recognized and corrected in early childhood.

Writing in the *Indian Review* for December about

Indian Music

Mr. Kannoomal says:

A Hindu approaches the Goddess of Music as a pious, earnest, and devoted votary caring little for his worldly success and not as an interested professional artist who seeks her secrets to better his material prospects. Sur Das, Tulsi Das, Hari Das are the great exemplars before him. They were the men who, through the instrumentality of music, saw the vision divine and reached the final goal of human evolution.

There are seven primary notes briefly called S, R, G, M, P, D, N., which are the warp and woof of the charming and variegated web of Indian music. At first there are six major tunes called Ragas arising from the combination of these seven notes in a particular manner. Then each of these Ragas produces five sub-tunes called Raginis, which are all dominated with the central notes of their Ragas. By a further combination of the Ragas and Raginis are produced numberless minor tunes—each individual in its expression but dominated by the notes of the Raginis from which they have sprung. It will thus be seen that while the principal Ragas and Raginis are only thirty-six, the number of their offspring is legion. The peculiarity about these Ragas and Raginis is this, that they can be sung only in their prescribed season and time. For each there is a particular season and a particular hour of the day or the night when it would be sung.

In Indian music "each Raga and Ragini has been personified with a wealth of detail and a delicacy of expression."

Bhairavi—one of the sub-tunes of Bheron Raga—is represented to be a young woman with fair complexion and large eyes who is clad in a white *Sari* and a red-coloured corset, with a garland of Champak flowers round her neck. She is conceived as sitting on a crystal seat worshipping Mahadeva and singing with the measures of time well kept.

Similar are the descriptions of other Ragas and Raginis.

The World's Largest Literary Work.

The Chinese are a great people. Their contribution to human advancement and civilisation has not been meagre. Their stupendous activities in the field of literature were very tragically "recalled last year by the appearance in London of two sections of the Chinese Encyclopaedia, lent to the London Library by a man who picked them up for a song in a book shop of the British metropolis."

From the description of the work published in the *Library Miscellany* it will be seen that before it the modern lexicographic enterprises, such as the New English Dictionary, the Encyclopaedia Britannica, etc., pale into insignificance.

We are told that the Chinese work under review "comprised originally no less than 11,100 volumes, but the melancholy fact is that

This huge work, the fruit of years of incessant labor by a whole army of Chinese scholars, was practically wiped out of existence during the Boxer Rebellion of 1900, when the rebels set fire to the Han Lin College where the encyclopaedia was housed. A few scattering volumes were rescued from the ruins of the building and have been turning up since then in China and other countries, but there is nothing near enough to give an adequate idea of the amazing scope and completeness of the work as it stood in its entirety.

One of those who visited the ruins of the college after its destruction by the Boxers was Lancelot Giles of the British Consular Service, who picked up one volume of the encyclopaedia. After that his father, Herbert A. Giles succeeded in obtaining five more.

The history of the creation and the completion of the work is thus set forth in the *Library Miscellany*:

It was in the year 1403 that Yung Lo, third Emperor of the Ming Dynasty, one of the most energetic rulers that ever held sway in China, decided that he must have a compilation of all known writings. So he commissioned Hsieh Chin, the most eminent scholar of his time, to prepare a great encyclopaedia embodying this immense hoard of material. Hsieh Chin set to work, assisted by a staff of 146 other learned men, and finished his task in one year and four months. It was called the Wen Hsien Ta Cheng, or Complete Record of Literature. Huge as it was, however, it did not anywhere near come up to the Emperor's wishes; his aim was to create something far surpassing what he considered the modest dimensions of Hsieh Chin's production.

So a new Imperial Commission was formed, on which Hsieh Chin was one of three Commissioners, for the compilation of a new and far more formidable work. In addition to the three Commissioners five directors, twenty sub-directors, and 2,141 assistants were employed—a total of 2,169 persons—for the Emperor's idea was to collect together all that had ever been written in the four departments of Confucian, canon, history, philosophy and general literature, including astronomy, geography, cosmogony, Buddhism, Taoism, handicrafts and arts.

After something like four years of unceasing labor the army of scholars submitted the result of their toil to the Emperor and won his august approval. He had reason to feel pleased, for, as a result of his insistence, there stood before him an array of 11,100 volumes, comprising 22,877 sections and an index occupying sixty sections more. Each of these volumes was half an inch thick, and the whole of them, if laid on top of each other, would be 450 feet high—higher than the dome of St. Paul's Cathedral.

Each of the volumes was 1 foot 8 inches long by 1 foot wide, bound in the pasteboard common to

most Chinese books, and ornamented with yellow silk, the imperial color. On each volume two labels were placed, one giving the titles and numbers of the sections contained within, the other the rhyme, according to the Hung Wu Cheng Yun, or rhyming dictionary used in the days of the Ming Dynasty under which all the entries were classified. This curious arrangement was due to the fact that as Chinese is not an alphabetical language, it is impossible to arrange the entries in Chinese encyclopædias, dictionaries and the like alphabetically, as is done in English and other languages of to-day. As a result of this the Chinese have been forced to resort to a variety of methods of classification for easy reference, among them this rhyming scheme adopted in the great encyclopædia of Yung Lo. Another method, by the way, which is frequently used, is to group together words which have similar first syllables.

Each section of the Encyclopædia Maxima has twenty leaves, which makes a total for the entire work of 917,480 pages as against 22,000 in the edition of the Encyclopædia Britannica, which was the latest at the time of the destruction of the Chinese work. Each page has 16 columns of characters, averaging 25 characters to a column or a total of 366,992,000 characters. Chinese is written with extraordinary condensation, 100 characters corresponding, according to one authority, to 130 English words. Therefore, it may be said that the total of characters given above corresponds, in reality, to something like 400,000,000 of English words. Now the Encyclopædia Britannica used by Mr. Giles for purposes of comparison had a total of 30,800,000 words. This as much as any one detail, gives a vivid idea of the stupendous nature of Yung Lo's compilation.

In 1410 it was decided to have the vast work printed, and orders were issued by the Emperor to that end. But it was found that the expense would be so tremendous that the project was given up.

In 1421, when the Emperor transferred the seat of government from Nanking to Peking, the encyclopædia was taken along to the latter city and stored in a pavilion of the imperial palace.

In 1562 a body of 100 scholars was ordered to make a copy and a duplicate copy of the work. These they completed in 1567, whereupon the original was sent back to Nanking, the first copy placed in the Peking palace, and the duplicate copy in the Office of Imperial Historiography.

When the Ming dynasty fell, in 1644, the original of the work at Nanking and the second copy at the Historiography Office were destroyed by fire. This left only the first copy at Peking, which was transferred from the palace to the Han-Lin-College, outside the Imperial City, where it remained until its destruction by the Boxers. After the transfer it was found that 2,422 sections, or about 1,000 volumes, were missing.

All the above was duly set down in the great Chinese imperial catalogue, but the figures given were of so amazing a nature that many foreigners questioned their accuracy and even doubted that such a work as the Encyclopædia of Yung Lo had ever been created at all. Nor did the Chinese Government deign to set their doubts at rest, for it resolutely set its face against all endeavors by "foreign devils" to gain access to the Han-Lin College and see for themselves the splendid monument of Yung Lo.

The five volumes secured by Herbert A. Giles deal with poetry, canonization of emperors, arithmetic,

history, and costumes. At the end of each volume is a slip with the name of the official whose duty it was to copy, punctuate and compare with the original.

Important statistics about

Immigrant Labour in Assam

have been published in the *Indian Emigrant* for December.

Regarding immigration we read:

The number of persons immigrating during the year was considerably higher than in any of the preceding four years. There was a substantial increase in immigration from the Sonthal Parganas and Chota Nagpur and from the plains districts of the United Provinces and Bengal. There were, however, fewer arrivals from the Central Provinces and Madras. The health of the coolies in transit was again good. The number of deaths was 42, as compared with 32 in 1913-14, the majority being due to cholera. The Chief Commissioner is pleased to note that the number of cases of fraudulent and irregular recruitment fell from 101, in the previous year to 81, of which only 29 were found on investigation to be true.

Regarding contracts and wages we are told that

The number of coolies executing contracts in the recruiting districts decreased from 3,776 to 2,465. The contracts of 46 coolies recruited for Sylhet, which were referred to in the last year's resolution, were cancelled at the beginning of the year. The number of contracts cancelled by the efflux of time was 2,455 against 2,479. These were regularly reported in all districts except Sibsagar where seven managers had to be warned for the omission to report expiries regularly. Three hundred and fifty-three contracts were dissolved by mutual consent against 552 in the preceding year.

Then again

The recorded birth-rate was 25.9 per mille calculated on the total strength of the coolie population and 88.8 per mille on the adult female population, the figures for the preceding year being 25.5 and 86.6 respectively. The recorded provincial birth-rate was 32.94 per mille of the total population and 177.71 per mille of the total adult female population.

For the total labour force the registered death-rate was 24.2 in 1914-15 against 24.7 in 1913-14, the number of deaths being 20,876 against 20,577. The rate among adults was 27.7 as against 28.2 in the preceding year. The highest death-rate (34.8) was recorded in Darrang and the lowest (23) in Cachar. As a result of the enquiry made by the Deputy Sanitary Commissioner with the object of bringing the Sanitary Department into closer relation with the tea industry, to which a reference was made in the last year's resolution, it has been decided that the monthly returns of births and deaths on tea gardens should be forwarded to the Sanitary Commissioner after being dealt with by the Civil Surgeon of the district, and should be supplemented by an annual return giving figures for the garden population which, together with the monthly returns, will enable the Sanitary Commissioner to watch the health conditions on every garden. As

regards the suggestion that the inspection of unhealthy gardens should be performed by the Sanitary Commissioner, it has been decided that such inspections shall ordinarily be carried out, as at present, by the Civil Surgeon, the inspection reports being submitted to the Sanitary Commissioner for any suggestions which he may have to make.*

During the year under review the number of gardens on the unhealthy list decreased from ten to five, four of which were in Sibsagar and one in Lakhimpur. Four of them have been in the unhealthy list for three years in succession.

There were three complaints of ill-treatment made by coolies against their employers during the year. One was found to be true and the other two were dismissed. Four hundred and seventeen applications for discharge certificates were filed of which 215 were successful. One thousand three hundred and eleven cases were instituted by Managers under Act XIII of 1859, 324 being decided in favour of the complainants and 904 being dismissed; ninety coolies were sent to prison. Ten cases of riot or unlawful assembly and five charges of assault were instituted by Managers. Generally speaking, the relations between employers and employed were excellent.

The number of desertions of Act labourers reported was 979. One hundred and twelve warrants were issued for the arrest of deserters; arrests were effected in 32 cases and 19 coolies were convicted, ten being punished with imprisonment.

The Educated Indian Citizen

is the title of an useful article in the January number of the *Young Men of India*. Indians old or young, who want to serve their country may take a lesson from the following observations made by H. C. Herman in the course of the article under review.

What of home rule? representation upon an Imperial Cabinet or Parliament? primary education? social service? economic reform? industrial development? local and municipal affairs? These are burning questions; but where can you find a man who has even a skeleton of facts that have been carefully and correctly gathered? The philosophy and religious ideals of India have relegated facts to the rear; and these problems will only be solved by those who are willing to pay the price of hard work and know the subject.

But is not *social service* an expression of the growing aspiration of India? Ugly contrasts with conditions in other countries are striking at the pride of the educated Indian, and he wants to put things right, but seldom knows what to do. Does this not offer the best opening to use, both in approaching the disinterested Indian citizen and in conserving his growing aspiration to serve his country, not by helping to dissolve the British Government in India, but by leading him down into a parchay and keeping him there long enough to find out that practically every one is in debt, living in squalor, the drains clogged, houses insanitary and the rate of infant mortality appalling? If he will visualize these facts, not theoretically but vividly, just as they are marring and ruining life, there is some hope of his waking up to the fact that as an educated citizen he is responsible for such conditions, and should do his

best to remedy them. Some Associations fortunately find at hand an organization whose interests are excellent, but whose benefits are limited by the human factor—such organizations as the Social Service League at Bombay, Bangalore, Calcutta, Madras and other cities. But any Association can undertake a simple programme of social service, and expand as rapidly as resources permit. The organization of Co-operative Credit Societies seems to be most urgent in view of the crushing indebtedness everywhere. Night schools, boys' clubs, bringing pressure to bear on the authorities to clean streets and drains properly, securing adequate medical service—these are only a few suggestions. Probably investigation of conditions close at hand is the best sedative for an overdeveloped sensitiveness towards the problems of the Empire.

Psychology of Wealth.

In the course of an article in the *Vedic Magazine* for December L. Balmukand Kohli writes:

Wealth is the only determining factor to entitle one to a certificate of respectability of birth. The fact is, however, ignored that the so-called families are founded and obliterated even in one's lifetime. Innumerable examples can be given of impecunious persons becoming masters of wealth, earned either honestly or dishonestly, and then being reduced to a state of pauperism either in their lifetime or in the lifetime of their children or grandchildren. A man not possessed of riches however irreproachable his character, however chaste his ideas, however straightforward his dealings with others and however sympathetically disposed towards human sufferings, is generally looked upon with hatred and contempt by the so-called society of to-day, and is a person of no importance merely because of his poverty. On the other hand, a man wallowing in wealth without virtue or decency finds renown and respect, whether false or genuine, stored for him everywhere.

A man of humble origin by his intelligence, capacity, industry, etc., (or good luck whatever one may be pleased to call) elevates himself from impecuniosity to shining opulence and lays the foundation of a family. The very family once styled low is then termed respectable and all its descendants are termed honorable. With the revolution of time and vicissitudes of fortune the family again loses its prominence and is reduced to a state of obscurity. One of its descendants turns out extravagant, squanders away in idleness or immoral pleasures, all the wealth which was earned by fair or foul means and jealously guarded by his father or grandfather or other relations, and the family is again unable to keep the wolf from the door.

The tyranny of rich over the poor is proverbial. In the majority of cases they have neither the inclination, nor the capacity nor the leisure to evince practical sympathy for the hardships, privations, and disadvantages which their poor brothers undergo in this life. They consider it derogatory to their position even to talk to them. They have all the conceit and presumption of wealth and are always intoxicated with the little fortune or position they enjoy. Too much wealth, moreover, has often a demoralising effect on the owners. Young people born with a silver spoon in their mouth and inheriting large fortunes, generally do not realize their social responsibility and status. Their moral outlook is limited by their weakening minds.

Should we not be able to say :

I ask not for his lineage,
I ask not for his name,
If manliness is in his heart,
He noble birth may claim.

Hindu Polity About B. C. 300

is the title of a highly interesting article contributed to the *Educational Review* for December by V. Rangachariar. The article under review is based on the *Kautilya-artha-sastra*. Of the *Kautilya-artha-sastra* we are told :

As a detailed and scientific description of the pre-Mauryan state, its constitution and characteristics, its manner of working and its ideals, the *Artha-sastra* is of incalculable value. The *Artha-sastra* was not written after the foundation of the Mauryan Empire. It does not describe an imperial constitution ; it does not say how Chandragupta arranged for the administration of the Empire, how he united the various kingdoms and states under one political sway, how he reconciled the local feelings and institutions with the imperial idea and so on.

The King and his Ministers; their functions:

Chanakya enumerates seven elements of sovereignty, namely, the territory, the king, the minister, the fort, the treasury, the army and the friend. A wise king, "trained in politics, will, though he possesses a small territory, conquer the whole earth with the help of the best-fitted element of his sovereignty, and will never be defeated." The king's functions were to appoint ministers and departmental superintendents, to bestow rewards on the worthy and punishments on the wicked, and to always endeavour for the welfare and prosperity of the people. The minister's functions were to guide the deliberations in the council, to enforce them in practice, and to look after the administration in all its branches—the business of revenue-collection and its expenditure, the maintenance of national independence and security, and the installation of princes. "In the absence of ministers, the above works are ill done ; and like a bird deprived of its feathers, the king loses his active capacity. In such calamities the intrigues of the enemy find a ready scope. In ministerial distress, the king's life itself comes into danger, for the minister is the mainstay of the security of the king's life.

The King and the Kingdom are the primary elements of the state. Kautilya attaches enormous importance to the moral purity of the King and holds that he should also preserve the social purity of the people.

Next to the ethical guardianship of the world, Kautilya mentions the duty of choosing ministers. "Sovereignty is possible only with assistance. A single wheel can never move. Hence he shall employ ministers and hear their opinion." They should be men of tried ability, of absolute integrity, of financial skill and of great proficiency in the science of politics. These ministers seem to have been pure administrative officers and not councillors. Those "whose character has been tested under religious allurements," says Kautilya, "shall be employed in civil and criminal courts ; those whose purity has been tested under

monetary allurements shall be employed in the work of a revenue-collector and chamberlain ; those who have been tried under love-allurements shall be appointed to superintend the pleasure grounds, both external and internal ; those who have been tested by allurements under fear shall be appointed to immediate service ; and those whose character has been tested under all kinds of allurements shall be employed as prime ministers, while those who are proved impure under one or all of these allurements shall be appointed in mines, timber and elephant forests, and manufactories." They were to be consulted by the king in all acts of administration. The subject-matter of a council shall be entirely secret.

As a safeguard against the autocracy of ministers

Kautilya holds that as a single minister might proceed wilfully and without restraint and as two ministers might either overpower the king by their combination or imperil him by their dissension, the king should consult three or four ministers at least.

The King could not remain indifferent to the affairs of the state.

Kautilya insists on the king's personal scrutiny over all departments. He divides the day into 16 parts and allots a duty to each. "Of these divisions, during the first one-eighth part of the day, he shall post watchmen and attend to the accounts of receipts and expenditure ; during the second part he shall look to the affairs of both citizens and country people, during the third he shall not only bathe and dine, but also study ; during the fourth, he shall not only receive revenue in gold, but also attend to the appointments of superintendents ; during the 5th, he shall correspond in writs with the assembly of his ministers, and receive the secret information gathered by his spies ; during the 6th, he may engage himself in his favourite amusements or in self-deliberation ; during the 7th, he shall superintend elephants, horses, chariots and infantry, and during the 8th part, he shall consider various plans of military operations with his commander-in-chief." Similar duties were fixed during night, 4 parts being assigned to sleep. Activity was thus an absolute requisite.

We read further :

The ministers or superintendents of departments were about 16 in number, and included a chamberlain, a collector-general, an accountant-general, the superintendents of agriculture, manufactures, public works, forests, and so on.

Kautilya prescribes very minute and elaborate rules for the guidance and conduct of the finance minister and his subordinates. The chamberlain and collector-general, he says, "shall have so thorough a knowledge of both external and internal incomes running even for a hundred years that, when questioned, he can point out without hesitation the exact amount of net balance that remains after expenditure has been met with." He shall "conduct the work of revenue-collection, increasing the income and decreasing the expenditure." He was to keep a careful vigilance against officers whose conduct was such as to cause loss of revenue to the State. "A Government officer, not caring to know the information gathered by espionage and neglecting to supervise the despatch of work in his own department as regulated, may occasion loss of revenue to the Government owing to his ignorance, or owing to his idleness when he

is too weak to endure the trouble of activity, or due to inadvertence in perceiving sound and other objects of sense, or by being timid when he is afraid of clamour, unrighteousness, and untoward results, or owing to selfish desire when he is favourably disposed towards those who are desirous to achieve their own selfish ends, or by cruelty due to anger, or by lack of dignity when he is surrounded by a host of learned and needy sycophants, or by making use of false balance, false measures and false calculation owing to greediness."

Sources and forms of income :

Kautilya enumerates six sources of income, the durga or city, the rural parts, mines, gardens, forests and herds.

Kautilya sees the necessity of classifying the *forms* of income as distinct from the *sources* of income, of the *Ayamukhas* as distinct from the *Ayasarira*. And in his classification we find certain divisions which naturally strike us as curious. He divides the forms of income under seven headings, namely, mula (capital), bhaga (share), vyaji (premium), parigha (?), klipta (fixed taxes), rupika (premium on coins ?) and atyaya (fixed fines).

We read the following as regards the emergency means of replenishing the treasury :

Kautilya explains the ways and means by which the treasury could, on special occasions* when special expenditure was necessary, be replenished. The king could demand the payment of one-third or one-fourth of the produce of his *rich* agricultural subjects. He could increase the fines on the peasant criminals and order special cultivations for the State. Similarly one-sixth of the forest produce, and "of such commodities as cotton, wax, fabrics, barks of trees, hemp, wool, silk, medicines, sandal flowers, fruits, vegetables, firewood, bamboos, flesh and dried flesh," one-half of ivory and skins of animals, could be taken. Merchants dealing in gold and silver, in pearls and gems, and elephants and horses had to pay 50 *karas*. "Those that trade in grains, liquids, metals (*loha*), and deal with carts shall pay 30 *karas*." The clothier, the copper, bronze and brass merchant, the liquor-seller had to pay 10 *karas*, and artisans 20 *karas*. "Dramatists and prostitutes shall pay half of their wages. The entire property of goldsmiths shall be taken possession of." Those who reared cows, buffaloes, etc., had to give away one-tenth of their live-stock. Two wholesome restrictions Kautilya gives in regard to these special taxes ; and they are (1) that they ought to be taken only once and never twice ; and (2) that poor people, those engaged in important government service, those who colonise waste lands, forest-tribes and learned Brahmins, ought not to be made to pay.

Besides these special taxes the king could demand subscriptions on false pretences. He could sell honours and titles, employ sorcerers to delude men and deprive them of their over-abundant wealth, take away the collections of religious institutions, create pseudo-temples for popular endowments, and resort to other ingenious methods. Spies might be made to become partners of commercial exploiters with the view of robbing them, prostitute spies might be made to enamour rich men and poison them. Measures like these, says Kautilya, "shall be taken only against

the seditious and the wicked and never against others."

Speaking of the administration of justice in the law-courts the writer observes :

One remarkable feature was that the judge could be fined for neglect or over-bearing temper, for unnecessary delay and similar defects. He could be fined eight times the value of a suit if he spoiled it in some way or other, and could be chastised with capital punishment if he unjustly awarded it to the parties.

"The laws of punishment in criminal cases were very severe and draconian."

Torture could be resorted to, except in the cases of youngsters, the aged, the afflicted and the lunatics, to extort confession ; but torture was legal only in case where there were sufficient evidences to shew that a particular man was guilty. No woman could be subjected to it in case she was pregnant or had not passed a month after delivery. "Torture of (ordinary) women shall be half of the prescribed standard." An alternative to torture was espionage, and this was to be resorted to in case of Brahmins and ascetics. Kautilya enumerates the various kinds of torture that could be resorted to, and divides them into four kinds,—viz., punishments (which in turn were six in number), whipping of which there were seven kinds, suspension from above which had two varieties and water-ordeal. Thieves of individuals or the royal treasury could be subjected many times to these tortures. "Whatever may be the nature of the crime, no Brahman offender shall be tortured. The face of a Brahman convict shall be branded so as to leave a mark indicating his crime :—the sign of a dog in theft, that of a headless body in murder," and so on. After having thus branded to a wound and proclaimed his crime in public, the King shall either banish him or send him to work in mines. Those who seized *valuable* articles from Government mines or manufactories could be beheaded, and those who took articles of small value fined.

An alternative to fines in some cases was the parading of the criminal through the streets, his body being smeared over with cowdung, and an earthenware pan with blazing light tied round his loins. Shaving and exile were other alternatives. An officer using unauthorised seals could be even condemned to death. An unjust judge could be punished with the middlemost amercement (i.e., fines of 200 to 500 panas) and dismissed. An adulterer had to pay a fine of 500 panas or had his ears and nose cut off. Abduction was chastised by the cutting of the legs or fine of 600 panas. "When a Sudra calls himself a Brahman, or when any person steals the property of gods, conspires against the king, or destroys both the eyes of another, he shall either have his eyes destroyed by the application of poisonous ointment or pay a fine of 800 panas." "Any person who aims at the kingdom, who forces entrance into the king's harem, who instigates wild tribes or enemies, or who creates disaffection in forts, country parts or in the army shall be burnt alive from head to foot." If a person broke the dam of a tank he should be drowned in that very tank. A poisoner was subject to the same penalty. An incendiary was to be thrown into fire.

FOREIGN PERIODICALS

Fitness of Orientals for Self-Government.

At the last annual Convention of the American Political Science Association, Dr. Frank J. Goodnow, President of Johns Hopkins University and former Political Adviser to the President of Chinese Republic, read a paper on "Reform in China". In this paper President Goodnow made certain statements concerning the political incapacity of the Orientals, which drew from Dr. Sudhindra Bose of Iowa State University a few impromptu remarks. They have been published in *The American Political Science Review*, and run as follows :

It seems that the Occidental people find no end of difficulty in understanding and interpreting our Oriental laws, customs, and institutions. We are told, for instance, that the Chinese like other Asians, who are mainly agricultural peoples, are unfit for representative government. I doubt if this statement can stand the test of adequate proof. Take, for example, the people of China, whose recorded history runs back to 2800 B. C. These Celestials, these agriculturalists, had from time immemorial enjoyed local self-government, had been accustomed to "take communal action" : they would close up their business and resist the imposition of an unjust tax. It is to be remembered that the powers of the mother of parliaments developed in this fashion. "The financial functions of parliamentary assemblies are always the centre of their action."

In India, another agricultural country, we had the village community which contained the true germs of representative government. These village communities have frequently been described by such authorities as Sir Charles Metcalfe, Sir Henry Maine as "little republics."

Further, we are told by Western critics that the Chinese, along with the other people of the Orient, are slow to move, that they are static, preferring to submit to the iron rule of an autocratic king. On the other hand those who have even a slight acquaintance with Chinese history

know that the Chinese are a democratic people. Mencius, the great Chinese political philosopher, put the people first, the gods second, and the sovereign third in the Chinese scale of national importance. Mencius once said to a ruler : "If you can win the hill people—that is, the humblest of the common folk—then, indeed, will you become the Son of Heaven." Again, when Wu Wang killed the tyrant emperor Chow some time in the eleventh century before Christ, the Chinese historians wrote : "Wu Wang did not slay his ruler ; he simply executed a tyrannical individual."

In India, too, we find that the ancient Hindu law-givers have laid down that the misgovernment of a tyrant king not only constitutes a default of the ruler's title, but even a forfeiture of his life. Indeed, Manu himself has said that a king who oppresses his subject should be deprived of his life together with his relatives.

There is no more virtue in killing kings or their kinsfolk than there is in manslaughter in general ; these facts are referred to only to show to what extent and in what sense orientals believed in the divinity of kings.

In Asia as in Europe the divine right of kings, the belief that the rulers were appointed by heaven, has, of course, found credence. But when these Asiatic monarchs failed to promote the general happiness of the nation, failed to live up to the will of heaven, they were given short shrift. They were removed and replaced by another sent of heaven. Historians seem to admit that such revolutions have taken place at least twenty-one times in China, resulting in as many changes of dynasty. Besides, there have been various usurpations of power of a limited scope, and if all these partial revolutions are considered, China, the so-called conservative China, can boast of no less than thirty revolutions.

The old assertion that the Asian people are unfit for self-government does not bear examination. Look at Japan ! When the Asiatic Japan promulgated its constitution of a parliamentary government in 1899,

the astonished Europe laughed. Has not the marvellous success of Japan—Asiatic Oriental Japan—in establishing and maintaining a constitutional government proved beyond the shadow of a doubt what other Asian nations could also do if they were free?

In India, the land where I first saw the light of day—the land where mighty empires existed and flourished long before the English had ceased to dwell in paleolithic caves—in India, I say, the people are told to-day, after a hundred and fifty years of “enlightened cultured” rule, that the Indians are not and never will be fit for self-government. How in the name of common sense can a country be fit for self-government, or for that matter for anything, unless it has a chance to try it out? Is it not almost a political truism that self-government alone fits a nation for self-government?

To be sure, some of the Oriental nations have shown incompetency: they have been found guilty of graft and corruption. We are sincerely sorry for them. But I have been informed on good authority that there are also many countries in the West which are not above the charges of graft and corruption. Are we to believe now that the Western nations have proved their inability for representative governments? For one, I have little faith in the judgment of patronising Europeans, who on their annual summer tours in the United States brazenly ask: “How long can this republic endure?”

To conclude, I challenge the assumption that representative forms of government are the monopoly of the West. I resent the implication that the Orientals are in any essential manner different from the Occidentals. We of the East ask only one thing of the West. It is this—that you of the West stay away from our problems: leave us to solve our own problems, to work out our own destinies, while you spend your time looking after yours. The greatest good you can do us, the lasting benefit you can confer on us, is to let us alone.

Destructive Virtues

is the title of a short though thoughtful article appearing in the *Spectator*.

“Certain qualities like certain plants, seem to take the goodness out of the ground. Where they flourish they flourish

alone. In their immediate neighborhood nothing else comes to ‘perfection,’—these are the opening lines of the article.

Take for instance the quality of amiability.

There is something destructive in its sweetness. Very amiable people have no other marked characteristics. Amiability always makes a man or a woman popular. Why the word has been debased till it means almost the reverse of lovable we do not know. But some word had to be found to fit a curious negative quality which no one could dislike, and which was destructive alike of faults and virtues, and that one was chosen haphazard.

The character of the really lovable person is always painted in decided colors, and most of us would hesitate to apply the word “amiable” to any one we really cared for. It is, of course, incorrect to make it a synonym for “stupid.” Only persons of a very small vocabulary make so silly a use of the word. Stupid people are very seldom amiable. They may be slow to take offence, because they are slow to take in anything, but they are most ill-natured and implacable when once they have grasped it. Lack of imagination—and that is what stupidity is—is a deformity of character. We ought to be sorry for the deformed, but we are not obliged to say that they are graceful. It is the element of the heroic which amiability destroys—enthusiasm, passion, and the power of sacrifice. The great human qualities are weakened by it, and the amiable person is not much missed. “So-and-so is dead,” we say. “What a pity! He was a very amiable man”; and straightway we forget him and what manner of man he was. Conspicuously amiable people never come, as it were, very near to any one. They are isolated by the fragrance of their own atmosphere. It is a great gift, however, for those endowed with it are often impervious to pain, always free from worry, very little capable of resentment, and never short of pleasant company.

Self-control is another destructive quality.

Where it exists to any very conspicuous extent, it is apt to dwarf the rest of the character. Yet what a fine thing it is! A man determined to hide all his emotions from his fellows has a pride which is inhuman in its grandeur. What, though, does one mean by inhuman? No trait is less animal than self-control. It is impossible not to admire the man whose self-command is perfect; it is impossible also genuinely to like him. Now and then such people inspire a rather childish form of hero-worship, a sort of idolatry; but their worshippers regard them, consciously, unconsciously, as symbols—signs implying moral conceptions, not men and women. If a man becomes a tyrant over himself, he will destroy his personality almost as surely as he would destroy that of any other victim of his over-developed will-power.

The following observations on literary musical and histrionic faculties will be found interesting:

We have heard it said that the musical faculty destroys others, but an instance of this theory has never come within the present writer's experience, and would seem to be effectually contradicted by musical biography. All great composers have been men of strong minds. Calculating boys are said to grow up stupid; but these interesting freaks of Nature seem to be

complete freaks. Neither their existence nor the sort of temporary, spurious, and limited genius they possess has ever been accounted for. Ordinary mathematicians are, as a rule, men of conspicuous ability in other branches of thought. This much must, we think, be conceded to them, though their special talent often arouses in peculiarly abstract forms of mind a sort of jealous contempt. The ignorant world admires the mathematician very much, but among learned men he is very often suspect. Is it true that the histrionic faculty destroys others? Logically, this would seem to be impossible. Histrionic power should be the outcome of wide sympathies and a deep understanding of human nature. There should be something of Shakespeare in every great actor. Some people would probably say that there is such a something. On the other hand, no one will deny that more often there is a good bit of the ape. In so far as acting consists of mere imitation, we expect it does kill other talents; but perhaps such acting is never great. The literary faculty is supposed by many men who have not got it to unfit a man altogether for active life. They insist on making the old false verbal division between men of thought and men of action. The men who say it refuse to believe that any but active work is work at all, and therefore they omit the factor of time wholly from their calculation. Shakespeare could not have written his plays and been Prime Minister, but that a country would be lucky indeed which was ruled by a Cabinet of Shakespeares we suppose no one could doubt.

"In conjunction with love, jealousy, though a horribly inconvenient quality, is hardly a vice" and does not fall under the category of destructive virtues.

Ought jealousy to be called a vice? Whatever it is, it is in some of its forms a fearfully dominant quality. But we doubt whether love can exist in a high form without something of it. Putting aside the question of husband and wife, no woman can see herself dethroned in the heart of her child without a pang, even though imperative separation makes such dethronement desirable for the child's happiness. But jealousy which has nothing to do with love is a horrid thing—the bind-weed of character squeezing the life out of all that is best and most human. It mutilates sympathy, it destroys geniality, it gives birth to spite. It is like a demoniacal possession, and the demon is roused to mischief by the sight of good luck and happiness, and will destroy them if he can.

Russia and India.

Under the above heading Mr. John Pollen, contributes to the *Journal of the East India Association* an interesting article in which we find many points of similarity between the Russian and the Indian peoples. In fact there is much of the oriental in the Russian, and they are sometimes correctly styled as the *Orientalists of the West*. The observations of Mr. Pollen are specially important as they come from one who has had long personal experience of both Russia and India. We learn that the writer had paid three visits to Russia, had been

connected with the Anglo-Russian Literary Society, and had put in thirty-two years' Indian service. Says Mr. Pollen:

I wandered freely through the length and breadth of Russia, and, except at the hotels in the big towns and when leaving the country, I was never troubled about my passport at all! and I may add that during my residence in Russia I never experienced any incivility from Russian officials except once, and that was from some German underlings in St. Petersburg. In their kindly readiness to help the stranger, I found the Russian police were very like the Metropolitan and Dublin policemen and the Irish constabulary. The village police reminded me very much of the Indian village police; and coming from the plains of India, I was, of course, quite at home with the Russian village headman, the village community, and the village system generally. Many things in the customs, manners, and surroundings of the Russian people, particularly in the rural districts, are simple and plain to the traveller from the East, although they sometimes hopelessly puzzle the wanderer from the West. Like the Indians, the Russian country-folk are great upon greetings and salutations, and I was much amused at the way the sledgemen and cab-drivers in Moscow and other towns used to take off their caps and hats to one another as they drove by. I remember once asking one of these drivers why he was always doffing his cap, and he reminded me that it was written in our Scriptures that the Godhead had created man in His own likeness, and "that," said the driver, "is the reason why I take off my cap to my neighbour, for in saluting him I am saluting the image of my Maker." Nothing, however, as is well known, will induce an orthodox Russian to worship or salute a graven or carved image of any kind whatsoever (and in this he is as strict as the strictest Moslem), for this would be breaking the Commandment—"Thou shalt not make to thyself any graven image," etc.; but he does not care how many painted or sainted pictures he bows down to and to all appearance adores. Great is the reverence paid by Russians to cikons, or Holy Pictures, of which there are many in every orthodox Russian home and in churches and in shrines. These cikons are as numerous in Russia as "Ganpatis," "Hanumans," and "Mahadevs" in India.

When an orthodox Russian enters a room he always first salutes the Holy Picture in the east corner and crosses himself before he takes any notice of anyone in the apartment. In most of the offices and shops in Russia, besides the eikon you will also find a picture of the Emperor, and this is why you take off your hat on entering. You are, as it were, in the Imperial presence.

In Russian churches there are no graven images and no chairs or seats, but there are plenty of exquisite mosaics and Holy Pictures, or cikons, richly robed in carved gold or silver garments and studded with precious stones, representing our Lord, the Virgin, Prophets, and Holy Men of old. In a Russian church the worship is more individual than collective, and you can stand or kneel or prostrate yourself, just as the spirit moves you, or can have a quiet chat with your neighbour while listening to the window-shaking intonations of the gorgeously robed priest. But you will hear no music save of that of the human voice, for organs are unknown in orthodox churches.

Speaking of manners the writer says:

You offend against Russian taste by eating with your hat on, or by moving the salt, or by crossing your legs or by sitting on the edge of a table, or by entering a room with your overcoat or goloshes on, etc.

About the treatment of women in Russia we read :

Russia is in many respects Oriental, and this is, perhaps, chiefly seen in the way women are treated and regarded. Traces of the "purdah" and of the seclusion system can still be found, especially in remote provincial towns. In the villages and rural districts, however, there is little trace of the "purdah," for there the women are very much in evidence. They seem the only people who work or really *do* anything. The Russian woman is, speaking broadly, not beautiful to look upon ; but this does not matter much, for amongst the country-folk the village maiden is selected as a bride, not for her looks or accomplishments and acquirements, but for her "muscle," the chief object of the father-in-law, or head of the family, being to get a good, strong, healthy worker into the household. The bridegroom, except in rare instances, has very little to say to the choice, but piously receives his wife (as Adam did his Eve, and as they still do in India), as "a help-meet for him," without questioning the wisdom or judgment of those who made the choice. The ordinary Russian is, however, no believer, in "woman's rights," and some of the popular sayings and proverbs of the people are even more uncomplimentary to the fair sex than some that obtain in India. Thus, if woman offers advice unasked, she will probably be told that though her hair is long her wit is short, or that she is "lank in locks but lacking in wisdom, or loose in logic." Another saying declares that there is "only one soul in seven women !" While a third proclaims that a woman has no soul at all, but only "steam." The latter assertion, perhaps, implies a compliment, for there can be no doubt that woman is the "propelling power" in a Russian household, and in the village councils and assemblies her voice frequently prevails above that of the men. In the peasant's hut and on the farm she does everything ; she is the first up in the morning and the first afield. She grinds the corn, lights the fire, prepares the meals, attends to the children, drives the plough, weeds the field, digs the potatoes—and most of these things she does *singing* !

Wife-beating is recognized as a right in Russia, and a peasant would be amazed if you told him he had no right to beat his wife, and he would tell you that at the village altar he swore not only to love and to cherish, but also to chastise her if necessary. I must say I never saw any wife-beating in Russia, but I have seen many a good wife belabouring her drunken spouse and dragging him along home by his shaggy red locks ! The drunken husband usually takes this treatment most good-humouredly, and strives to kiss his wife as she is pulling him along, thus returning a kiss for a blow—the right thing to do—as we were taught in Sunday-school.

This statement of Mr. Pollen about the treatment of drunken husbands by their wives is admirably borne out by Dostoevsky in his famous novel *Crime and Punishment* where he describes a similar incident.

The writer goes on to say :

The position of women in Russia is, of course, not

now what it used to be, and it is to Peter the Great that the emancipation of the women in Russia is chiefly due. He did away with the old custom according to which the bride and bridegroom were not allowed to meet until the day of the marriage ceremony, and the bride was not unveiled till the marriage ceremony was over. He aimed at the equality of the sexes, and published a decree that six weeks should elapse between the engagement and the wedding, so that the couple might make each other's acquaintance. He encouraged the education of women, and got his own daughters educated. It is suspected that English ladies (of whom there were always several at the Russian Court from the days of John the Terrible) really influenced Peter in making these innovations. Peter's wife and sister also helped the Emperor in his heroic efforts to better the position of women in Russia.

From his own "personal knowledge and observation" the writer has to say the following about the Tsar of all the Russias.

The Tsar moves about amongst his people as freely and with as little ostentation or precaution as the members of our own Royal Family. I have seen him driving about in a single-horsed sledge all by himself, and on ceremonial occasions I have watched the Imperial procession moving slowly down long lanes of respectful spectators, with only a few policemen about twenty or thirty yards apart to keep the crowds in order. The Emperor is regarded as a semi-divine personage, and is the well-beloved representative of his people—in very truth their "Little Father"—and the accounts which represent him as a dreadful tyrant are all nonsense. His throne is as broad-based upon his people's will as that of our own "temperate Kings."

About the Russian people he says :

A very lovable, light-hearted people are the Russians, fond of sad songs, tea, beer and brandy or vodka. The peasants and village labourers (again like the Indian and Irish cultivators) are very happy-go-lucky, inclined to take things easily, to indulge in "Kalatnost" ("dressing-gownedness"), "fatalism," and "perhapsedness" ; "What will be, will be" ; "Perhaps, Don't be afraid, and God is not without mercy." To get a good idea of the Russians one should see them at the railway-stations and in the village inns and taverns as well as in their own homes. They seem seldom to be in a hurry (except when they are driving or sledging, and then they go the pace). They arrive at the railway-stations, just like the people in India, hours before the time fixed for the departure of the train, and loiter contentedly about the spacious waiting-rooms carrying huge pillows (for a Russian never travels anywhere without a pillow), or they sit feasting in the truly regal refreshment-rooms ; while their ladies stroll up and down on the platforms outside smoking cigarettes, or sit drinking tea in a corner round a samovar. Wherever a Russian man or woman goes, the samovar is in evidence.

The leading characteristics of the Russian people, high and low, are certainly hospitality and kindness to strangers.

The Future Government of India from a Practical Point of View.

The *Asiatic Review* for November prints a letter from the pen of J. B. Pennington which should be of especial interest to us at the present moment when the proposal of forming a Home Rule League is being discussed in India. In the letter under notice, which is remarkably free from any bias, the writer has made out a strong case for the Indians. Says he :

It is impossible for the people of India, or any other country, to learn the art of government without practice; and the only reasonable question is, How art they to get that practice ?

We have taught what is often called "a microscopic minority" to become one of the finest subordinate services in the world; but we have done very little so far, except incidentally, as in the quasi-independent Indian States, to teach them the art of governing others, except, again, in a very subordinate way. How, then, did we ourselves learn the art of self-government, so far as we have learnt it ? Chiefly, it must be confessed, by fighting amongst ourselves for hundreds of years. But we cannot afford to let the millions of India learn the art of self-government by cutting each other's throats and the survival of the fittest. Nor is it necessary. "All great statesmen," says Gustave le Bon, "of every country, including the most absolute despots, have regarded popular imagination as the basis of their power, and have never governed in opposition to it." "It was by becoming a Catholic," said Napoleon, "that I terminated the Vendean War; by becoming a Musalman that I obtained a footing in Egypt; by becoming an Ultramontane that I won over the Italian priests; and had I to govern a nation of Jews I would rebuild Solomon's Temple."

The writer closes his letter by re-telling the story of Peary Mohan Banerji of Uttarpara, better known as the '*Fighting Munsiff*'. The official report of his services in the Mutiny, by the District Magistrate of Allahabad (Mr. Thomson) runs as follows :

"Babu Peary Mohan was appointed a Munsiff at Manjhanpur in this district in November last, and has since been indefatigable in his exertions to drive back the rebels in his part of the district. Though not actually in his province of duty, he offered himself to the Commissioner to assemble the well-affected Zamindars, to engage and conciliate the doubtful, and thus create a Government party against the disaffected. He has succeeded so well that he has been able gradually to restore the police authority in all but a few villages now held by the rebels, and gained a victory, his report of which I now enclose."

A writer in the *Calcutta Review* gave the following particulars of his career :

"The native Civil Judge—a Bengali—by capacity and valour brought himself so conspicuously forward as to be known as "The Fighting Munsiff." He not only held his own defiantly, but he planned attacks, burned villages, wrote English despatches thanking his subordinates and displayed a rare capacity for rule and fertility of resources."

It was Lord Canning who in his despatch highly commended the gallantry of Peary Babu and first called him "The Fighting Munsiff."

—

To the *Islamic Review* for December A. Neville J. Whymant contributes a short notice of

Jalal-Ud-Din Rumi

the Persian mystic and poet, about whom we are told :

He was born of noble descent, at Balkh, in A.D. 1207 and died in A.D. 1273, but lived for most of his life at Quniya (the classical Iconium). He is described as chief of all the Sufi poets, not only by native scholars and biographers, but by independent historians of East and West.

He was the founder of that great order of Sufis the Mawlawi, that mystical order of dervishes, and is to this day revered as the Interpreter of Heavenly Mysteries.

Perhaps the chief charm about this man "clad in garments of song" is that he was mystic before poet. Only when his soul had soared into the heights and sunk to the depths in pitying condescension did he take his reed and write his verses. He went through a turmoil of chaos to the Fountain of Life itself, and there fed his soul on the Eternal Vision of Divinity.

Although he was above all a mystic, there is that about his poetry which recalls the fragrance of Hafiz.

His two great creations are the *Diwan-i-Jalal-ud-Din-Rumi* and the *Masnavi*.

The *Masnavi* is regarded by the Sufi Brotherhood as the infallible guide to them in daily Sufi practice. Of course Al-Quran is to them the premier guide but The *Masnavi* is a fragrant garden of perfume where the Sufi may walk and find comfort and peace. This book is a code of law and guidance to those mystics whereby they may regulate their lives in accord with the will of the All-compassionate, the All-merciful. For the essence of his teaching—although by mystic phrase and verse—was the view of the ultimate Unity of All Being—the cardinal doctrine that Allah is one, and through Him all is one.

The *Diwan* abounds in glorious idealism. Perfect mysticism and psychic perception of Divine truths are manifest in these pages. Let us see a few :

"Keep clean thy Garment from defilement,
Keep clean thy hand and mouth,
Thy Heart from Spite's revilement.

Within, *Within*, let all things spotless be."

In the original of these lines there is an insistent call lost in translation, but it can be seen how great is his call to the *Soul*. Again :—

"My desire shall always be
More to have than Needs decree,
Even as gay Flowers I pluck
New Spring Blossoms smile at me.

And, when sweeping through the skies,
From swift spheres new Fires will rise,
Only True, Immortal Love
From Perfect Beauty doth arise."

At night time think of this :—

“When all is still and the earth has gone to sleep,
Wake Thou in me!
When wearied with the day my tired eyes sink to rest
Wake Thou in me!
When eyes in Paradise unsleeping guard me o'er
As stars above,
Dwell in my sightless eyes as my Dear Guest,
O Wake ! Wake Thou in Me.

And when the Dark of after-Life is here,
And Love's smile dawns
And draws me, Love-like, ever to thy Breast,
Wake Thou in me ”

REVIEWS AND NOTICES OF BOOKS

ENGLISH.

Administration of Criminal Justice in Ancient India—A. V. Ramanathan.

Mr. A V. Ramanathan tries to give us a view of the “Administration of Criminal Justice in Ancient India” in some 15 pages. His paper is based on the *Sukraniti*. But the latter work, as we have it, is a product of the 8th century of the Christian era. No doubt many traditions in the *Sukraniti* are ancient, but the work can hardly be a basis for predixating a system to be gathered from it as “ancient.” The administration of Criminal Justice in Hindu India was a growth and the stages of that growth have to be distinguished.

Mr. Ramanathan's review of the system as found in the *Sukraniti* is fair and faithful. He has done well to point out the mistake of the popular view that imprisonment in Hindu times was not a common form of punishment.

No thorough attempt has yet been made to present the criminal branch of the legal history of Hindu India. When it is done, the world will find that it was the most advanced system, judging it even from modern standards. The law of evidence was developed to a point beyond which it has not progressed in modern times. The system of punishment has to be considered in the light of criminological theories of the Hindus which undertook to “cure the psychology” (*prayashchitta*). The rigour of ancient penallaws was gradually softened by various modifications introduced by the crown during successive centuries. For instance: certain exemptions in favour of merchants introduced by the Mauryas were pleaded 800 years after them, those exemptions really superseding the letter of ancient law. The historian of criminal law of Hindu India has to take into account that his sole guide is not the Hindu code.

K. P. J.

A Study of Education in Baroda—Thakorlal Ranchodlal Pandya B.Sc., A.M. Ph. D. (Published by the author, Baroda).

Baroda and its enlightened prince have been long identified by the present generation of Indians with everything which is most progressive in the country. “Compulsory education is the one plank,” says Mr. Manubhai Mehta in his valuable introduction to the volume, “in the edifice of reforms inaugurat-

ed by H. H. Maharaja Sayajirao Gackwad which is likely to serve as the mystic ladder to National Regeneration.” After reading Dr. Pandya's interesting essay one could hardly doubt the truth of the dictum.

Dr. Pandya begins with rather a cursory historical sketch of education in India from the earliest times down to the present day. One of the most fascinating chapters in Indian history, viz. the account of our ancient Parishads, of the great monastic universities of ancient and mediæval India has still to be written. Dr. Pandya has however written a very interesting book dealing with the history, organisation and problems of education in Baroda.

In 1893 the first tentative measure towards compulsory education was introduced in a small district, and it was not until April 1907 that education was made compulsory throughout the state on the occasion of the Silver Jubilee of His Highness' rule. “In Baroda,” says the author, “the order from throne brought about a change which would not have occurred even within a century.” The results already achieved within less than 10 years are truly amazing. The percentage of population receiving education in the whole country is only 1·9; in Baroda it rises to 10. “The average number of square miles served by one school in the Bombay Presidency comes to 16·7 as against 3·8 in Baroda, which spends over 10 per cent of its total revenue on education.” “The total expense on education per capita in British India,” remarks Mr. Manubhai with justifiable pride, “amounts to 1/16 of a rupee; in Baroda it amounts to 3/4 of a rupee.”

Education is a gift worthy of kings, and the royal bounty of H. H. the Gackwad extends alike to boys and girls, irrespective of their castes and families. The reforming spirit of the Maharaja did not stoop to compromises with regard to the education of girls, or of children of our unredeemed countrymen—the ‘pariahs,’ in deference to protests or murmurings from orthodox quarters. “The dignity of labour is better understood in Baroda; and few states in India have laboured as jealously as Baroda to snap the chains of caste-hegemony and burst the barriers of birth-rights and vested privileges. Separate primary schools have been opened in villages for the benefit of the untouchables; and they are also given free admission along with boys of the ‘chosen’ classes into the higher secondary schools.” No less

than 9 per cent. of the total number of these depressed classes are at school. 'An order from the throne' has indeed been effective.

Well-nigh 70 millions of Indians are ruled by princes of their own blood, and yet the self-governing Indian States receive but scant recognition at the hands of our educated countrymen. Nowhere in India is to be found that bond of unity, that spirit of spontaneous loyalty and affection as is cherished by the subjects of our Indian States towards their rulers. People in British India are apt to overlook the unique position of these States as regards the future development of the country. Under the watchful supremacy of Pax Britannica the Indian States are left to devote all their energies and resources solely to internal progress; and the centralisation of power in the hands of a single person gives that freedom and elasticity necessary in embarking on new and even venturesome experiments, which a highly complicated and organised administrative system cannot command. Hence it is but just that we should look to our States to take the lead in matters of social and political progress. It is from them that we expect the evolution of a polity suited to our national genius, in accordance with modern needs and springing directly from the roots of our national tradition.

Dr. Pandya's book gives an admirable survey of the results achieved by a single piece of legislation, undertaken not in response to popular demand, but entirely on the ruler's own initiative. It is by no means an undiluted panegyric, but also deals with the various shortcomings as regards the low rate of teachers' pay, the suitable medium of education in the secondary schools and various other educational problems. It is but fitting that such a book should be dedicated to Modern Baroda and its Maker—the present Maharaja.

The Study of Indian Economics—by Prof. N. M. Muzumdar. (Bombay) Price, 2 Annas.

This short essay was delivered as a lecture to the Bombay Students' Brotherhood. Prof. Muzumdar passes in rapid survey the various economic problems of modern India and suggests the usual lines of inquiry. Prof. Muzumdar has done well in giving a list of useful books bearing on Indian problems.

N. C. MEHTA.

ENGLISH-SANSKRIT.

The Sanskrit Research: *Anglo-Sanskrit Quarterly devoted to research work in all fields of Indian Antiquity, conducted by the Sanskrit Academy of India, Bangalore, Edited by Pandit Uingesha Mahabharata (Kurtkot). Annual Subscription Rs. 5-0-0, £ 0-7-0, \$ 2-00. For copies apply to the Oriental Books Supplying Agency, B. Shukrawar, Poona City.*

Generally we do not review periodicals, yet the importance of such a journal in the field of Sanskrit learning persuades us to say a few words about it. "There are," as is said in the editorial, "two classes of persons interested in Sanskrit learning. Pandits who have been trained according to old lines, and scholars who have received education according to new methods." And it is very rightly believed that without the help of either of them Sanskrit learning cannot satisfactorily progress in all its aspects. We are, therefore, very glad to see that the guiding body of the Magazine under review has fully realised the truth. So says the Editor in describing the object of his Quarterly that his "Magazine is designed to give to both these two types of workers a meeting place and a common

platform. And it is our earnest hope that the two streams of thoughts once they have come together will be complementary to each other and will, like the holy confluence of the Ganges and the Jumna, flow onwards to a common goal....." It should also be observed here that our Sanskrit Pandits are generally quite unacquainted with the great advance made in various directions by the Western scholars in the research work of our Sanskrit literature and this deplorable state of the former is by no means desirable. Both the scholars Eastern and Western must know each other very well and we have reasons to hope that this kind of journal will help us to some extent in our attaining the object. The first number of the Sanskrit Research on our table contains ten articles in English and four in Sanskrit from the pens of distinguished scholars including the great Indian Savant Dr. R. G. Bhandarkar. Almost all the contributions are interesting and suggestive, but one "Orientation of Sacrificial Hall" by Pandit Shyamshastri B.A. seems to rank first for its originality. We heartily welcome the new Quarterly.

The Vishnusahasranama with a translation in English by S. N. K. Bijurkar, B. A. (Mamlatdar), Malwan, Ratnagiri, pp. 165. Price Two annas.

Those who believe in the existence of God also believe that there is *only one* God. To believe in more than one God is utterly absurd. We know no religion deserving mention where the existence of many Gods is maintained. It is true that the Hindus worship Vishnu, Shiva, Durga and a thousand others like them, but nowhere do they say that there is more than one God; on the contrary it is often urged that even to suppose such a thing is obviously unreasonable. When they worship Vishnu they do not think or are not advised to think that Shiva is quite different from Vishnu. To a true devotee every thing appears as Vishnu; for there is nothing but Him. He has manifested Himself in the form of the existing world; in every thing He is, and every thing is in Him. This is what a true Hindu worshipper thinks. He holds and he does it very reasonably that God has endless—numerable qualities (अनन्तगुण). And these qualities or attributes

if rightly contemplated upon fill one's heart with the divine nectar of pure piety and real love which easily lead one to realize Him. This is why the Hundred and Thousand names (सत्तनाम and रुद्रसूतनाम) of different deities are composed and daily recited in Hinduism.

Vishnusahasranama or the Thousand names of Vishnu belongs to this class of writings. Like the *Bhagavadgita*, *Sanatsujatiya*, etc., it forms a part of the *Mahabharata* (i.e., XIII अनुशासन पर्व 254). Its importance is evinced by the fact of its being commented upon by the great Shankaracharya and other ancient teachers.

In the text adopted by Mr. Bijurkar the reading of the second line of the verse 104 (p. 139) is "सुविता प्रपितामहः". It is also found in two MSS. as indicated by the editor of the *Mahabharata* published in Kumbakonam. But the reading सुविता (See the edition of the *Mahabharata* referred to) seems undoubtedly preferable. On page 89 "निष्ठा शान्तिः पराश्वः"—

these three words are taken by the author as one name, but evidently these are different ones. We also cannot understand how this line is rendered by him as "Best refuge of devotion and tranquillity." The translation which is not in a few cases defective and inaccurate would be better should the author add a short explanatory note to the difficult words where it is absolutely necessary, as for instance, दण्डकः (p. 13,) क्रमः (p. 21) etc.

The Jaina Scripture Gift Series. No. 2. Pure Thoughts. Samayikapatha by Acharya Amitagati, translated into English by Ajitprasad M.A., LL. B., Vakil, High Court, Lucknow.

In this nicely printed booklet Mr. Ajitprasad, the well-known editor of the *Jaina Gazette*, has offered us with his own translation the original Sanskrit text of the above work consisting only of 32 (or 33) verses which is recited by the votaries of Jainism in their daily divine service called *Samayika*. The text appears to have been reproduced without any correction from Brahmachari Shitalprasadji's edition in Bombay and consequently there are some mistakes. The translation is also not faithful, some of the original words being left out untranslated or misunderstood.

VIDHUSHEKHARA BHATTACHARYA.

HINDI.

Shail-Bala arthad Adarsha Badhu, by Pandit Murlidhar. Published by Haridas Vaidya, 201, Harrison Road, Calcutta. Crown 8vo. pp. 103. Price as. 5.

This is the Hindi translation of the novel of the same name by the famous Oriya writer Pandit Jauardhan Pujari. We cannot say what immense benefit it can do to any female, old or young, into whose hands it may be put. The silent suffering of a female under the tyranny of her father-in-law's household is depicted in a simple and homely narration; and the book is as much a homily to the tyrants as to the sufferer. No household should be without this book. The printing and get-up are the best possible. The District Boards and educational institutions will do well to purchase sufficient number of copies of this book for prize distribution in girls' schools.

Charit mala by Panditya Lochan Prasad. Published by Haridas Vaidya, 201, Harrison Road, Calcutta. Crown 8vo. Price as. 5.

This is a collection of short lives of some noted celebrities, most of whom have been wisely selected from among Indians. The book is sub-divided into two parts: *Stree-vibhag* and *Purush-vibhag*, the former consisting of the lives of four ladies and the latter of 12 gentlemen. Most of these short lives were published in journals and have been reproduced after suitable alterations. The people honoured have been dexterously chosen to be such whose lives may not be known to the people through text-books and other agencies. We commend the book strongly to the perusal of the public and young men. The get-up and printing leave nothing to be desired.

Balvir Charitavali by Pandit Nandkumar Deva Sharma. Published by Joshi Company, Shrihakur Lane, Calcutta. Crown 8vo. pp. 89. Price—as. 8.

This is a collection of the lives of some ancient saints and others who evinced considerable heroism

in their boyhood. There are books of biographies especially meant for young men and even for girls and ladies, but there were lack of handy books especially meant for boys. The language is in some parts too hard, and the general rule for publications meant for boys should be that their language should be simple: there ought to be no exception to it. In other respects, there is no objection to the language. There are some printing errors here and there.

Italy ki Swadhinta athwa us ka adhunik itihās by Mr. Nandkumar Deva Sharma. Published by Govindram Hasanand, 213, Bowbazar Street, Calcutta. Crown 8vo. pp. 108. Price—as. 6.

This might be said to be the modern history of Italy. The narration is interesting and has been couched in suitable language and style. Besides the historical aspect of the book, there is some especial interest in it which is due to the way in which the narrative has been handled. The printing and get-up are nice and the language satisfactory.

Hindi Bhaktamal aur Pranpriya Kavya by Mr. Pannalal Jain and to be had of Digambar Jain Pustakalaya, Chandavari, Surat, Crown 8vo. pp. 38. Price—Anna 1.

This small pamphlet contains some poems which are of a religious turn. They teach morality and can thus be read with profit by all. Though the author is a Jain, there is not much of his own religion in a special way in the publication.

Daish Bhakti kai Nau Prakar by Mr. Ganga Prasad Gupta. To be had of Manager, Art Press, Benares City. Demy 8vo. pp. 32. Price As. 2, Rs. 1-4 0 for a dozen.

In this book it has been shown that patriotism can be evinced in nine ways. In the opinion of the author loyalty is another form of patriotism. The author has quoted from authoritative writers and the book as a whole is very interesting.

M. S.

URDU.

Tufuya Alam by Lala Atma Ram M. A., Asst. Professor of Mathematics, Government College, Lahore, Published by the Society for Promoting Scientific Knowledge, Lahore. Demy 8vo pp. 38. Price As.—4.

This is a very useful publication on the origin of the Universe and the way in which the earth and other planets were produced has been dealt with in an exhaustive way. The style is the best suited to young readers. The book combines in it up-to-date and current information with simplicity of narrative. We commend the book to school authorities. There are several instructive and neat illustrations in it. The get-up is nice.

M. S.

GUJARATI.

Kartanya Kaumudi, by Shatavadhani Pandit Muniraj Shri Ratnachandraj, published by Chunilal Vardhaman Shah, printed at the Diamond Jubilee Printing Press, Ahmedabad. Pp. 431, Cloth bound. Second Edition, Price Re. 0-5-0. (1915).

Pandit Muniraj Shri Ratnachandraj is an ornament to the ascetic section of the Jain Community on this side of India, and his Study of Sanskrit is deep and extensive. He has written this book in Sanskrit,

whilst the text is explained in Gujarati. It is taken up with the different duties of men and women, and is full of popular illustrations which carry the meaning of the writer home. Though there is nothing new in it, still we think that a perusal or even a study of the book would repay the trouble taken in doing so.

Swami Ramtirtha, his *Sadupadesha*, Parts 8 and 9, published by The Society for the Encouragement of Cheap Literature, translated by Ratilal Chhotalal Pathak, printed at the Diamond Jubilee Printing Press, Ahmedabad, Cloth bound. Price Re. 0-12-0 (1915) with pictures.

Several more sermons and letters of Swami Ramtirtha are embodied in this volume which is well got up and furnishes useful reading.

Rajani translated by Mohanlal Makandas Mehta, and Bhagbanlal Girijashankar Bhatt, published by Balwantrao Kallianrai Thakore, B. A. Printed at the Lady Northcote Hindu Orphanage K. N. Sailor Press. Thick Card board. Pp. 162. Price Re. 0-12-0. (1915).

The Gujarati Sahitya Parishad has appointed a Bhandol (Funds) Committee and its Secretary Prof. B. K. Thakore has exerted himself in getting this book published. It is a translation of Bankim Chander Chatterji's novel, of the same name. In an introduc-

tion Prof. Thakore sets out his own opinion of Bankim's work and analyses the character of the different *personae* of the novel, and in raking up old bones from a graveyard nineteen years old, of this book, in the shape of a translation made by the late Narayan Hemchandra, the pioneer in the line of introducing the best Bengali works to Gujarat, points out his mistakes, and by contrast exalts the present work, in the moulding of which he says he has taken an active part with the two translators. That the labors of these men should have been requisitioned in translating one small work strikes one as being rather a disproportionate expenditure of time and energy, but perhaps some sort of driving force was required to finish the work as early as possible, and hence the conjoint efforts. The translation is well done, and will win approval of all those who would care to go through it.

K. M. J.

BENGALI.

Anjali or "Offering." By Satis Chandra Ray, M. A., Principal, Dyal Singh College, Lahore. Twelve annas.

This is a small devotional book of prayer and praise, suitable for being carried in one's pocket. It embodies the outpourings of a devout, earnest and sincere spirit, expressed in choice language.

R.

COMMENT AND CRITICISM

Pandit Tattvabhusan on the Arya Samaj.

While reviewing Lala Lajpat Rai's book on the Arya Samaj, Pandit Sitanath, we are afraid, has stepped beyond the boundaries of a reviewer. The learned Pandit is not sure if he should consider the teachings of the Arya Samaj to form a system at all. We are afraid the reviewer has not given a serious thought to the subject. Probably he has not studied the Arya Samaj literature. Else the great attempt of Dayanand to harmonise religions, his regular and well-ordered programme of life, his reconciliation of *Jnan*, *Karma* and *Upasana* paths into one organic whole should have elicited exactly the opposite remarks from the reviewer.

We join the learned Pandit in regretting the fact that Lala Lajpat Rai has not attempted a reasoned exposition of the doctrines of the Arya Samaj. But we can not believe that there can be no exposition of the doctrine of the infallibility of the Veda. Surely the learned Pandit does not mean to tell us that the great Hindu sages like Vyasa, Patanjali, Shankar, Ramanuj, Dayanand and Christian leaders and learned moulvis who believe in the infallibility of one scripture or the other are all either fools or knaves.

The Pandit shows utter ignorance of facts when he says that there is no demand for the reasoned exposition of the doctrines in the Samaj. Nearly all the Arya papers have taken Lala Lajpat Rai to task for this omission. Had the learned Pandit cared to read the *Vedic Magazine*, he could not have made such a statement.

We might also state here for the information of the learned Pandit that ever since the Arya Samaj has come into existence there has been a demand for the reasoned exposition of the doctrine. The doctrine of the infallibility of the Vedas has been discussed by the founder in his two masterpieces—the *Satyarth*

Prakasha, and the *Rig Veda Adi Bhashya Bhoomika*, by the martyr preacher Pt. Lekhram, by Swami Darshananda, by Lala Jiwandas, by Rao Bahadur Lala Atma Rama, in a way by Pt. Gurudatta Vidyarthi, M.A., and several other gentlemen in the Samaj. Prof. Tarachand has devoted no less than 1/3 of the space of his 'Life of Swami Dayanand' to a reasoned discussion of the teachings of the Master. We hope this could show the Pandit that Arya Samaj Leaders do not believe in the Veda as a matter of policy, but they hold that a belief in the Veda is a necessary and serious article of their faith. The Arya Samaj is not founded on a lie—a conscious falsehood.

As regards the allegation that the Swami believed in the Veda as a matter of policy, let us state that his life gives a direct lie to such allegations. His whole life was so full of sincerity and truth that hypocrisy and falsehood could have had absolutely no place in his life. Sjt. Aurobindo Ghosh has referred to it in his article on Dayanand.

The doctrine of *Niyoga* establishes beyond a shadow of doubt his sincere desire to preach nothing but what he believed to be right. He did not believe in compromise and never sacrificed his principles to other considerations.

Lastly we shall refer to the charge of spiritual barrenness in the Samaj. We regret to note that in this case also Mr. Sitanath has depended upon mere hearsay. He does not appear to possess firsthand knowledge. Now the Swami was a great spiritual leader. Principal Vaswani has paid him homage for this. Sjt. Aurobindo Ghosh has spoken of the 'puissant jet of this spiritual practicality' flowing out of Dayanand's life. M. Blavatsky in the obituary note spoke of the *Yogic* powers of the Swami. A great number of men, like Pt. Gurudatta

Vidyarthi, have been struggling steadily to lead high spiritual life. An average Arya Samajist goes through his spiritual *Sadhan* daily, weekly, and on especial occasions. Dayanand believed in *Bhakti* of a 'silent, serious and systematic character.' It may be stated that the 'sadhan' demanded by Dayanand is extremely exacting and therefore all are not able to completely conform to it. Hence there are regrets expressed—regrets which only tell us that the ideal is still far and that great and more serious struggle is needed. The critics misunderstand this situation, echo and re-echo the regrets and try to establish that there is an utter lack of spiritual life in the Samaj.

"NARAYAN."

Teaching of History in Indian Colleges. *

Every teacher of History must have read with profound interest and attention Professor Jadunath Sarkar's article "The Confessions of a History Teacher" which appeared in the December issue of the "Modern Review." The article is eminently suggestive and practical and although some of us may not be able to see eye to eye with the learned Professor in all things or may have different experiences to recount, we cannot but feel extremely thankful to him for his masterly discourse on the subject. We must also feel highly thankful to the Editor of the Review for inviting comments and suggestions on the paper and thus opening up a useful discussion. In response to his appeal I proceed to make a few comments on the subject of History teaching in our Colleges.

With all due deference to the Professor, I feel constrained to remark, in the very beginning, that I find it rather difficult to concur in some of his observations as regards the difficulties besetting the teachers of History in Indian Colleges. Personally I have not much experienced those difficulties myself as a History Lecturer all these years and I have reason to believe that, in this respect, I do not stand alone. It seems to me that these difficulties have been very much overrated by the Professor. Taking, first, the 'language' difficulty, although it must be acknowledged, to some extent in the case of our Lower, Secondary and even High School boys, it must certainly be difficult for some of us to believe that our College students too are really so deficient in English as to be unable to follow History lectures given in English or to give their answers in that tongue. If only the Professor takes care to come down to the level of his students and express himself in plain and simple language, I feel certain this difficulty cannot much present itself. I have only to cite my own experience as well as that of many others in this part of India, to bear out the truth of my statement.

As regards the difficulty caused for want of suitable environment in India, it seems to me—so far at any rate, as College students are concerned—to be largely imaginary. It cannot be difficult for our college students, with the aid of the illustrations and descriptions given by their Professors as well as of their own imagination and reasoning, to realise conditions and institutions outside the range of their experience. In fact, it is the very aim and province of History to deal with the events and institutions of ages and countries widely separated from us and by transporting us in imagination to those ages and countries to enlarge our mental horizon and develop our curiosity, imagination and sympathy. The difficulty pointed out by Prof. Sarkar, if it were much of a difficulty, cannot at any rate be one peculiar to Indian students alone. Taking lastly the difficulty

caused by the "burden of too many subjects and too ambitious a syllabus", I have only to observe that these are days of specialisation when each subject of study is meant to be taken up only by those who have a special aptitude for it. Seeing that History is a specialised study for many years (4 or 5) with some of our students and that a lion's share of their time and attention is given to it, the syllabus cannot really be regarded as being too ambitious.

From the foregoing remarks, it is not however meant to be understood that the teaching of History in our Colleges is altogether free from shortcomings or that the subject is everywhere as popular with our students as it deserves to be. What I wish to indicate is only that, if the subject fails to be sufficiently attractive and popular or receives but scant attention and patronage from our students, the real cause for it must be sought not so much in the difficulties pointed out by Prof. Sarkar as in the inefficiency or indifference of teachers themselves or in the faulty methods of teaching followed by them. If the teaching of the subject is to prove satisfactory, it need not be said that the subject must really be handled by a specialist who is keen at it and ever devotes himself heart and soul to its study. A veritable student himself, the teacher of History must ever be delving in the mine of historical literature and keep himself well-posted on the latest results of historical research. Further, he must be an enthusiast in his profession and be richly endowed with the gifts of voice, manner, delivery, imagination, judgment, talent for description, etc. needed for every successful teacher of history.

As regards the system of teaching to be followed in Indian Colleges Prof. Sarkar maintains that "the European system of the Professor delivering lectures and his pupils immediately writing down the main points of his discourse in their own words is impossible here" and that consequently the dictation of notes by the teacher cannot be avoided. "Notes must be dictated if the lecture is not intended to vanish like the passing breeze." The system recommended by him is then a combined system of teaching and notes-dictation. In this connection I may, however, be allowed to observe that the system of notes-dictation is indeed a pernicious system and should, as far as possible, be avoided. The system is dull and mechanical: it involves much waste of time: it is likely to give students a sense of false security: it is likely to foster cram: it may be overdone by the lazy teacher: it subjects all kinds of students to the same rigid treatment. In these and other reasons I am inclined to think that the system of notes-dictation should, leaving subjects calling for the utmost exactness and precision of language (e. g., Logic, Psychology, Physics, etc.), as far as possible be dispensed with. The system that I have myself followed with considerable advantage and success for many years, as regards history teaching in Intermediate classes, is in a way the very European system that Prof. Sarkar has ruled out of Court. Tried by the test of my own experience, it is a success and I do strongly commend it to the attention of the History teachers in Colleges. For the success of the system, the following condition must however be fulfilled. (1) The students must be furnished by the Professor, in advance, with brief outlines of the class lectures with suitable references for reading. What I have done here myself is to furnish my students with a small printed book embodying the outlines of a two years' course of lectures. Students are thus enabled to come fully prepared for the class-lecture and consequently to follow it with close attention and

unflagging interest. (2) The lectures given in the class must, as far as possible, be of a general character and deal only with salient points. If they enter freely into minor details, they are sure to become dull and distasteful to students. Details must be left to be picked up from the text-books. (3) Good text-books must be prescribed for students and their careful and diligent study must be enforced. (4) The delivery of the lecture must be slow, clear and deliberate and importance points must specially be emphasised and if necessary repeated again and again. Under these circumstances, the Students must be in a position to take brief notes, clearly and correctly, of the lecture. By means of anecdotes, illustrations, parallels, contrasts, reflections, the lecture must be made as lively, interesting and educative as possible. (5) The students must be required to take notes—longer or shorter—of the lecture and these notes must be examined from time to time. This is done by me during library periods. It is the notes taken by the weaker students that do really call for special attention at the hands of the teacher. If notes are thus taken by students in the class, the lecture cannot certainly vanish like the passing breeze.

By way of suggesting additional aids to the teaching of History, I have to make the following observations.

First, discussion classes or Seminars should be held by the teacher from time to time. Such classes are held by me once a fortnight. In these classes are discussed either questions given out beforehand or one or two short essays written by students on subjects assigned beforehand with references. Such Seminars will, for more reasons than one, be found to serve a really useful purpose. Personally, they have been found by me extremely lively and stimulating, keeping students, as they do, always active and on the alert. By Prof. Sarkar these classes are conducted in the Vernacular and by experience Vernacular Seminars have been found by him more successful than English ones. I am, however, of opinion that considering that our students have to learn their subjects in English and give their answers in English and that consequently it should be our aim to improve their knowledge of that tongue as much as possible, these classes should be held in English rather than in the vernacular.

Secondly, considerable attention must be paid by the teacher to the practice of Essay-writing by students. Essay-writing is done by my own Intermediate students here once a fortnight. Three or four subjects are assigned to them in advance, with suitable references. On the Essay-writing day, the class is divided into 3 or 4 sections and one subject is allotted at random, to each group. The time allowed for writing is 40 minutes. The essays are corrected by me one by one, in the presence of the students themselves, during the library periods and one or two of the best Essays are also read out in the class. It is constant practice in Essay-writing alone that can give definiteness and precision to the knowledge acquired by our students and enable them to face any examination ordeal, cheerfully and confidently. Prof. Sarkar appears to follow this system only in the case of M. A. students and on really advanced lines so as to cultivate, in them, habits of research. His system is certainly deserving of high commendation. I, however, believe that, on somewhat elementary lines, the system may also be followed, with considerable advantage, in the case of lesser students too.

Thirdly, as Prof. Sarkar observes, "we must encourage our students to read freely, instead of

pinning them down to particular book or set of books." If our History students are to acquire any proficiency at all in the subject, it can only be the result of a judicious and well-arranged course of reading. It is, therefore, the duty of every History teacher to see that his History library is well-furnished and that, in the case of particularly useful books, a number of copies is provided for each. Further the students must be advised by the Professor as regards the selection of books from the Library. He should also insist on their taking down brief notes in the case of whatever book they read and these notes should be examined by him from time to time.

P. S. RAMAKRISHNA IYER.

Lecturer in History, Ernaculam College, Cochin State.

The Ideal in History Teaching.

I have great pleasure in sending you the following few remarks suggested to me by the able and candid "Confessions" of Prof. J. Sarkar.

Of the three obstacles standing in the way of attaining the ideal in history teaching noticed by Prof. Sarkar, the want of an adequate staff and equipment seems to me to be the greatest and to call for immediate remedy. I am not undervaluing the difficulties of language and environment, but so long as almost everybody is considered fit to lecture on history, and so long as it is thought that history is, of all sciences the cheapest to impart—in the matter of equipment, the teaching of history is bound to fail very far short of the ideal. In this connection I must notice that reform should commence at the very bottom and pupils should be trained to methods of enquiry even in the higher forms of secondary schools. But this means the employment of an able staff all round, which again implies additional cost. I have found that our fresh-men who join the college-classes not only find considerable difficulty in following big text-books, like Bury's *History of Greece*—a much better book by the way, than either Tout's *Advanced History* or Lodge's *Modern Europe*—but cannot follow a chain of arguments or weigh evidence intelligently. These defects can be considerably remedied by better training in the lower classes. As it is I have found it possible to remedy these defects of the student's mind in most cases by a careful adjustment of the courses given. This necessarily sells against rapidity in work to start with, but what is lost in speed is gained in quality; and it is possible to make real and rapid progress in the later stages of the course, once the ground is prepared carefully beforehand.

The language difficulty is a real difficulty; but I cannot testify to better success with a vernacular medium, at least in my College and in this district. I may here state that most of my students speak and write English better than Tamil though they commit many mistakes of grammar and idiom in English, and that English serves me better as a medium of expression than Tamil—I mean in handling historical subjects. Perhaps the vernacular is not so well off in this part of the country as it should be; but I would like to put in a strong plea for a more extensive and intensive study of languages—classical, vernacular, and foreign, especially for those who wish to do original work in the domain of India's history. I have always tried to avoid dictating 'notes' with some exceptions, and I have often left large portions of the subject to be worked up by the student himself; in spite of some defects, which can be remedied by effec-

tive 'tutorial' assistance, I have found the system working on the whole satisfactorily.

Prof. Sarkar says "we must encourage our pupils to read freely." It is only by such a method that the study of the subject could be vitalized. Nothing appears to me more dangerous to freedom of thinking in the student, than a tendency in the teacher to dogmatise on controversial topics. Nothing will counteract this danger better than an extensive reading both in the teacher and in the student. Prof. Sarkar's suggestion that answers should be valued according to quality and not according to quantity, as is now done, is very sound; but for obvious reasons I dare not follow his suggestion until the method is generally adopted in the Madras University.

Hindu College,
Tinnevely.

K. A. NILAKANTAN, M. A.

P. S.—Recently, under the auspices of the Tamil Association of my College a paper on 'Hannibal' was read in English, evidently because the Association wanted a change!

The Meaning of Certain Words used by Brahmagupta.

May I offer the following suggestions and queries with regard to Prof. Mitra's article on "The Meaning of Certain Words used by Brahmagupta" in your November number?

From the facts that out of 16 propositions on quadrilaterals only 3 are as a matter of fact correct if *chaturasra* means 'quadrilateral' generally and *bishama* means 'scalene', and out of 5 propositions referring to *bishama chaturasra* only 2 are correct if *bishama* means scalene, while all are correct if the terms mean respectively 'cyclic quadrilateral' and 'having its diagonals at right angles to each other,' Prof. Mitra infers that it "is established beyond reasonable doubt" that Brahmagupta used these terms with the latter meanings.

A. With regard to *chaturasra*.—Surely the inference, and the only legitimate inference, that can immediately be drawn from Prof. Mitra's facts is that Brahmagupta was as a matter of fact using and working with

cyclic quadrilaterals. It is a subsequent question whether in doing so he realised that his results were (in most cases) limited to these and therefore consciously used the term *chaturasra* with a limited meaning. No light is thrown on this by the facts in themselves; other considerations must be brought forward, such as any knowledge we may otherwise have as to the scope and accuracy of Brahmagupta's knowledge, as to his methods of invention and use of technical terms, etc. Into such considerations I cannot enter; I desire simply to point out that Prof. Mitra's conclusion seems to go distinctly beyond the premisses as set out by himself.

B. In all cases of *bishama*, besides these general considerations, two special points seem to deserve notice:—

(i) The formula of the 8th verse for the diagonals is at once reducible to a much simpler form if the diagonals are at right angles, viz.

$$\frac{ab+cd}{k} \& \frac{ad+bc}{k} \quad \text{where } k^2 = a^2 + c^2 = b^2 + d^2.$$

Now if Brahmagupta had clearly before his mind the difference between quadrilaterals with mutually perpendicular diagonals and others, and gave the special name of *bishama* to the former, how is it that in this verse, in which he explicitly refers to *bishama*, he does not give for the special case its special and much simpler result?

(ii) Can Prof. Mitra make any suggestion as to what seems on the face of it a very extraordinary fact on his hypothesis—that the word *bishama* which etymologically, and I believe, in all its uses, has the connotation of 'uneven' or 'unequal,' should have been chosen by Brahmagupta to mean 'with mutually perpendicular diagonals?' Moreover, in the same work, both the relatively negative words *sama* and *abisama* are used in the sense of 'equal' or 'not unequal,' the latter in the very natural restricted sense of 'having two opposite sides equal': It is almost as if, in English, while using the phrase 'even number' in its regular meaning, one were to use the word 'uneven, as meaning, say, 'square.'

F. J. WESTERN.

NOTES

Fitness for Self-Rule.

PRACTICAL UNANIMITY AS REGARDS THE GOAL & IDEAL.

That India should one day become self-ruling, either within the British Empire or outside it, was a thought not absent from the minds of all British statesmen. Some of them have left it on record that that was in their opinion India's destiny. For instance, the Marquess of Hastings wrote in his *Private Journal* (May 17th, 1818):

30—13

"A time not very remote will arrive when England will, on sound principles of policy, wish to relinquish the domination which she has gradually and unintentionally assumed over this country, and from which she cannot at present recede. In that hour it would be the proudest boast and most delightful reflection that she had used her sovereignty towards enlightening her temporary subjects, so as to enable the native communities to walk alone in the paths of justice, and to maintain with probity towards their benefactors that commercial intercourse in which we should then find a solid interest." (p. 361-362, Panini Office Edition.)

That self-government is our goal is admitted by all. Even British officials in

India have in some recent utterances admitted that self-rule is the ideal towards which India should move. Self-government has found place among the subjects discussed approvingly by members of the Congress and the Muslim League parties. It is the declared object of the proposed Home Rule League. The question has also been discussed in the press in recent months. While all agree that self-rule is our goal and ideal, there are widely divergent opinions as to the time needed for the realization of this ideal. Lord Morley, the *radical* statesman, could not imagine a time when India would cease to be under personal rule. Others, gifted with a little more political imagination, place the time of the fulfilment of our hopes in the very remote future. Others, again, say that though the time is distant, it is not very distant. Some are of opinion that Indians ought at once to have some powers of control over the administration given them; while some others think that a complete scheme of self-rule should be immediately prepared, and powers should at once begin to be given to the representatives of the people in accordance with that scheme, full control over the administration civil and military, being vested in them in the course of the next 10, or at the most, 20 years, thus taking an effective step towards the perfect nationalisation of the government within a decade or so following. Under the circumstances it may be of some use to try to understand what is implied in fitness for self-rule.

WHAT SELF-RULE IMPLIES.

What is the work that a self-ruling nation does or is expected to do? or, in other words, what is meant by managing the affairs of a country? The principal duties of a government are to defend the country from foreign aggression, to maintain peace and order within its borders by preventing or suppressing rebellion, revolution and robberies, to raise a sufficient revenue by means of taxation of various kinds, to spend this revenue in the most economical and beneficial way, to make and enforce laws, to administer justice, and to make arrangements for education and sanitation, to maintain communications throughout the country by means of waterways, roads and railways for facilitating travelling and commerce, to make the country rich by helping and encouraging

the people to develop its agriculture, industries and commerce, to help the growth and expansion of a mercantile marine for the purposes of international commerce and intercourse, to encourage the growth of its literature and fine arts, &c.

GOVERNMENT WITH FOREIGN AND NATIONAL PERSONNEL.

These duties can never be performed satisfactorily by any foreign government. They can be so performed only where the government is national. For the foreigners constituting a foreign government having a duty to perform both to their own country and the subject country they govern, they cannot pay undivided and single-minded attention to the welfare of the latter, and in a conflict of interests between the two countries cannot prefer those of the subject country, as it is natural for men to be more anxious for the welfare of their own country than for that of other countries.

WHAT THE BRITISH GOVERNMENT HAS AND HAS NOT DONE.

In India for the last century and a half the British Government has been doing almost all the duties of a government, some energetically, some in a lukewarm manner, and some with indifference. To some duties it has not yet set its hands. For instance, there is no Indian navy, and Government has not helped or encouraged the building up of a fleet of mercantile vessels. On the contrary, it is during the British period of Indian history that the indigenous shipping and ship-building industry have declined and almost entirely disappeared. The Indian army is not manned in all its arms by Indians, there is no aerial fleet, and the commissioned officers are all non-Indians. But this is a digression.

OUR FITNESS IN BRITISH AND PRE-BRITISH PERIODS.

Those State duties which the British Government in India performs, are performed more or less with the help of the people of India. They were performed by Hindus and Musalmans in the age immediately preceding the British period, and in still more ancient times by Hindus and Buddhists alone. But whether Hindus, Buddhists, or Musalmans, those who managed the affairs of the country in the pre-British

period were Indians. Englishmen did not come to a country of savages, but to a country where the art of Government had made great progress.

In the British period, too, Indians have, on the whole, proved their fitness for any kind of work, civil or military, which they have been allowed to do. So it cannot be said that they are totally unfit for the discharge of all kinds of civil and military work.

SUBORDINATE AND INDEPENDENT DUTIES.

It may be objected, that it is in subordinate capacities that Indians have done their work and proved their capacity. That is true in the main. But in those cases also in which Indians have held independent charges, they have proved their capacity. Moreover, as they have not been given opportunities to prove their power of initiative and their fitness for independent work in most departments, logically it can only be said that in these departments neither the fitness nor the unfitness of Indians has been demonstrated. It should be borne in mind that this applies only to the British period. In the pre-British period Indians could and did do all kinds of work. Should it be said that there had been a deterioration since then, Indians alone could not be logically held responsible for such a result.

PROOF OF WORTH AND ITS RECOGNITION.

Government may say, "We would have given you high posts if you had proved your worth." But that is begging the question. How can fitness for a particular kind of work be proved unless one gets an opportunity to do that sort of work? It is like saying, prove that you can swim and then you will be allowed to touch the water. Moreover, it is not true that Indians get those appointments to which their qualifications entitle them. Take the educational department. Here the rule is to appoint even raw British and Colonial graduates to the higher service to the exclusion of Indians of tried merit.

In executive and administrative work, too, we find men like Romesh Chunder Dutt and Krishna Govinda Gupta could not get a lieutenant-governorship or even a chief-commissionership, though it cannot be said that they were inferior in ability to the general run of those British officers

who have filled these posts. There are many Deputy Collectors who can teach many Magistrates their duties. But the former always occupy a subordinate position. In the army even Indian winners of the Victoria Cross cannot hope to be lieutenants.

There is, no doubt, a natural reluctance on the part of Englishmen to acknowledge our fitness. For if our fitness were admitted, there would be only two courses open. One would be to give us all the posts for which we were declared fit; but that would mean the exclusion of Englishmen from many lucrative careers. The other would be to declare practically that though Indians might be fit, Englishmen, for selfish reasons, were resolved by the exercise of political power to prevent them from getting their due. But the rulers of India could not naturally make such a brutal declaration.

PRESENT-DAY INDIAN ACHIEVEMENT : CORRELATION OF CAPACITIES.

The successful management of the affairs of a country is not so mysterious nor so intricate and complicated a matter as to be beyond the powers of Indians to tackle and master. Different kinds of genius, talent, and capacity are not separate and independent entities; they are organically connected and correlated. If a nation gives evidence of genius, talent and ability in some spheres of human activity, it is safe to presume that it possesses the power to shine in other spheres of activity, too, if only it were allowed the opportunity. We shall not speak of ancient times. Even in these so-called degenerate days, the Indian is found among the world's great spiritual teachers and thinkers, the world's great litterateurs, the world's great artists, the world's great scientists, the world's great statesmen, and the world's great captains of industry. Even under the depressing circumstances of subjection, the Indian has fought his way to the British Parliament, to the highest Councils of the Indian Empire in London and Delhi-Simla, and won the Victoria Cross by conspicuous valour in the field of battle. It will not do to say that the small number of men to whom we refer are exceptions. The biggest trees are found, not in the midst of treeless deserts, but in tracts where there are other trees only less big than themselves. Take any age in any country and you will find that the most

famous poet, scientist, statesman, general, &c., were not solitary individuals, but only the greatest among great men. Shakespeare, Darwin, Gladstone, Wellington, Nelson, were not freaks of nature, but had contemporaries who were almost their equals. What is true of England or of any other country, is true of India, too. We have many men almost as gifted as those who have made a name, many probably equally gifted, and some possibly more gifted. Given the opportunity, and there is bound to be a greater manifestation of ability of a high order in all spheres of human life.

GETTING AND MAKING OF OPPORTUNITY.

We have used the word opportunity more than once. It may be said that nations like men make their own opportunity, nobody gives them opportunity. This is but partially true. The Negroes of America have got some opportunity and are consequently showing what stuff they are made of. In their native countries they never got the opportunity. But the objection has been raised, "Why could they not make their opportunity in their own country? The fact that the white European ancestors of the white Americans became civilized earlier than the Negroes shows the superiority of the white men; for the white men *made* their opportunity, the Negro had to be *given* the opportunity." It may similarly be said to us: "Why ask for opportunity? Make your own opportunity. If obstacles are put in your way, overcome them." So we will, so far as it lies in man to mould his destiny. But may we here remind all so-called "superior" races of one fact? Human history is not limited by the few centuries of European ascendancy. The Hindus, the Egyptians, the Chinese were civilised, they got and made their opportunity before all or at least the majority of European races. Why could not the Europeans make their opportunity when the Egyptians made theirs? Does that fact show the inferiority of the European races? The Japanese got and made their opportunity only half a century ago. There have been ups and downs in the history of all countries. Let none arrogantly assume that they have been wholly the makers of their own destiny. Let none, also, weakly assume that they are entirely powerless to mould their present and their future. Let all who have the power give the requisite

opportunity to those who need it;—the time may come for the givers of opportunity to be its seekers. Let all who seek the opportunity make it as far as in them lies, and it does lie in them to a very great extent. Fate or destiny is not a fixed but an indefinitely elastic boundary which nations can push further and further outwards by their strength and perseverance.

PAST, PRESENT AND FUTURE FORMS OF GOVERNMENT OF A COUNTRY.

Some people seem to think that the present and future forms of government of a country cannot be different from the forms of government which prevailed in it in former days. This belief or fancy has no foundation in historical fact; for in every one of the countries where at present there are either constitutional monarchies or republics, there was at some period of their history absolute monarchy. But should it be taken for granted that the past forms of government of a country qualify or disqualify its people for representative government at present or in the future, Indians would not stand utterly disqualified.

DÉMOCRACY IN PRE-BRITISH INDIA.

The earliest republics known to Europeans were those of ancient Greece and Rome. In India there were republics in ancient times in regions wider in extent than Greece and Rome combined, and for a longer period of time than the entire period of duration of those old European republics. College students who read Prof. Rhys Davids' "Buddhist India" and Mr. Vincent A. Smith's "Early History of India" know this fact. In the second number of the *Journal of the Bihar and Orissa Research Society* Mr. K. P. Jayaswal have written of republic in the Mahabharat. In the ancient Indian monarchies there were effective checks upon the powers of kings, though these were not exactly of the kind known to Europeans as constitutional. The Sanskrit word "raja," Rhys Davids says, originally signified something like the Greek *archon* or the Roman *Consul*. In his article on "Constitutional Aspects of Rituals at Hindu Coronation," published in the *Modern Review* for January, 1912, Mr. K. P. Jayaswal has shown that Hindu Kings used to be elected, or in any case their ascension

to the throne required popular ratification. This view finds support from the Hindu epics the Ramayan and the Mahabharat. In the Ramayan we know what King Dasarath did to ascertain the desire of the people as to who should be his heir-apparent, and also how the discontent of the people found expression when their favourite Ramachandra was exiled. In the Mahabharat similar evidence is found in what happened when the blind king Dhritarastra tried to make his own son Duryodhan king instead of the Pandavas, the rightful heirs. In the history of the Pal dynasty of Bengal we find the people electing a king after a revolution. Some account of the checks upon autocracy in ancient India will be found in Dr. Sudhindra Bose's and Mr. R. G. Pradhan's articles in the present number of this review. In Southern India, there were the "five great assemblies which checked the autocracy of Tamil kings, and which consisted of the people, priests, astrologers, physicians, and ministers." That village communities in India were so many little republics is well-known. This is true both of Northern and Southern India. Regarding Southern India Mr. Vincent Smith says:—

"Certain long inscriptions of Parantaka are of especial interest to the students of village institutions by reason of the full details which they give of the manner in which local affairs were administered by well-organized local committees, or panchayats, exercising their extensive administrative and judicial powers under royal sanction. It is a pity that this apparently excellent system of local self-government, really popular in origin, should have died out ages ago. Modern governments would be happier if they could command equally effective local agency." (Early-History of India, 2nd Ed., p. 418.)

THE ART OF GOVERNMENT IN INDIA OF THE PAST.

To what a pitch of efficiency the art of imperial and local government was carried in ancient India is clear from such works as Chanakya's *Arthasastra*, *Sukraniti*, &c., the epics Ramayan and Mahabharat (particularly the Santiparva of the latter), the *Samhita* of Manu and other *Samhitas* (codes), many epigraphic records, such as those on which Sir Sankaran Nair wrote in this review, the Greek accounts of Chandra Gupta's administration, and the achievements of Emperors Asoka, Samudra Gupta, Dharmapala, &c. In the Muhammadan and Maratha periods there were great statesmen and administrators

like Sher Shah, Akbar, Aurangzib, Shivaji and others. The statesmanship and administrative capacity of the Peshwas deserve to be better known than they are. An excellent idea of Akbar's administrative system can be had from Abul Fazal's *Ain-i-Akhari*. The revenue system of his minister Todar Mal has been followed by the British Government. Islam is democratic, and Musalman traditions favour the representative system. Before Ranjit Singh became the autocrat of the Panjab, the affairs of the Sikh states were managed according to democratic methods. The remains of ancient monuments of various descriptions, old land communications, water-ways, irrigation works, &c., bear witness to the high civilization and civic capacity of the people and rulers of India in pre-British days.

Our history, therefore, does not disqualify us for self-rule.

CONQUEST, AND LOSS OF CAPACITY FOR AND RIGHT OF SELF-RULE.

Englishmen generally think and many Indians also seem to hold that our unfitness for self-rule has been demonstrated once for all by the British conquest of India. They seem to ask: "If Indians are fit to manage the affairs of their own country, why were they conquered at all?" Conquest would seem, therefore, to be a justification for deprivation of self-rule. We need not here discuss historically whether British India as a whole or its major portion was conquered by the English. Let it be granted that we are a conquered people and let us examine this doctrine in the light of history.

EXAMPLES FROM BRITISH EMPIRE HISTORY.

The French Canadians were conquered by the English in 1763, but the whole colony became self-governing in 1791. After that date the French Canadians revolted more than once and were defeated and conquered as often. But they continue to be self-ruling. Some fifteen years ago the Boers of South Africa were defeated and conquered, but they were granted self-government almost immediately afterwards. Ireland was conquered centuries ago. But before the Union with Great Britain in 1801, Ireland had its own Parliament, and since the Union the Irish have enjoyed representation in the British

Parliament in a larger proportion than their numerical strength would entitle them to. They have rebelled, attempted to rebel and used methods of violence again and again, and have been baffled in every instance. But they have not been deprived of their right of representation. And now they are going to have Home Rule. Wales is a conquered country, but enjoys parliamentary representation and has local self-government. England was conquered by the Romans, the Angles and Saxons, the Danes and the Normans. But it is now among the freest countries in the world. Every country, in fact, which is now free and independent, was conquered at some period or other of its history. The British Colony of New Zealand has its own parliament. The aboriginal inhabitants of this colony, the Maori, now number only 50,000. But they return four members to the New Zealand parliament. This right was granted to them in 1871, immediately after their conquest by the white colonists. The *Encyclopaedia Britannica* tells us:

"They were poor marksmen, and had but little skill in laying ambushes. During ten years of intermittent marching and fighting between 1861 and 1871 the Maori did no more than prove that they had in them the stuff to stand up against fearful odds and not always to be worsted.....Even as it was the resistance of the Maori was utterly worn out at last. After 1871 they fought no more."

Other savage people in the British Empire who enjoy self-rule are the Gilbert and Ellice Islanders, of whom we have written in another article. True, the Maori and these savages are small in number; but the enjoyment by them of self-rule disproves the doctrine that conquest involves the forfeiture of civic rights.

EXAMPLES FROM FOREIGN HISTORY.

Numerous examples may also be given from the history of countries lying outside the British Empire. America conquered the Filipinos some 17 years ago. These half-civilized and uncivilized men have had home rule for the last decade or so, and have been promised independence or complete autonomy in another decade or two. Serbia had been autocratically governed by Turkey for centuries. With the assistance of some of the Christian powers of Europe and according to some provisions of the Treaty of Berlin it obtained independence in 1878, and its king and people have been managing their affairs well ever

since. Such also is the history of Bulgaria. It was under Turkish rule for centuries, and became independent in 1908 with the help of some European powers. Its king and people have not displayed any incapacity to conduct their own affairs.

CONQUEST DOES NOT INVOLVE LOSS OF SELF-RULE.

We need not multiply examples. Those which we have already cited are sufficient to show that conquest and dependence do not lead to utter loss of administrative capacity, nor do they mean or necessarily involve or justify forfeiture of civic rights. It is only right that it should be so. If some man, good or bad, armed or unarmed, defeats another man, that does not in any country mean that the former and his descendants and successors are entitled to deprive the latter and his heirs and successors of the natural right to possess, use and manage their estate, nor that they have lost the power to do so.

CONTEMPORARY HISTORY.

Let us briefly refer to contemporary history. Belgium has been a free country for some 80 years. It has been self-governing, and has made great progress in education, industry and commerce. Germany has conquered Belgium. But England, France and Russia are not convinced that that fact would justify the extinction of Belgian independence and liberty, nor that that fact proves the unfitness of the Belgians to govern themselves. On the contrary, the Allied Powers are rightly trying to restore liberty to Belgium. Serbia has similarly been conquered by Bulgaria and Germany. But the Allies are trying to make her free again. Poland had long been partitioned among and ruled by Germany, Russia and Austria. But during the present European war, both Russia and Germany have promised autonomy to Poland. If conquest and long subjection meant utter unfitness for self-rule, how have the Poles all at once become fit for autonomy?

INDIA'S SIZE AND HER MANY LANGUAGES, CREEDS, RACES, AND CASTES.

Home Rule has been thought unsuitable for India, because of its being like a large continent, where there exist many languages, creeds, races, and castes. But the Russian Empire is very extensive and is inhabited by a variety of races and religious sects,

and by peoples speaking many different languages. Yet it enjoys local self-government, and a large measure of imperial self-rule. The Austro-Hungarian Empire, too, is characterized by diversity of races, sects and languages. It has a constitutional monarchy and the form of government is largely representative. The United States of America is a republic populated by various races, speaking different tongues and having different creeds. The number of languages, as distinguished from dialects or local patois, spoken in India, has been exaggerated. In the census of 1901 they were stated to number 147; by 1911 they had increased to 220! In real fact one or other of a dozen principal languages would be found to be understood, whatever the province that might be chosen to test this statement. Besides, whatever force the multiplicity of Indian languages might be supposed to have against the exercise of self-rule by India as a whole in pan-Indian affairs, it can have none whatever against the enjoyment of provincial autonomy. In the United Provinces, Behar, Orissa, Bengal, Andhra, &c., the people of the province all understand one main language. As for our many sects and creeds, the people of India professing them are, to say the least, really not more intolerant of one another's beliefs and practices than the Christian sects inhabiting any Western country.

DESPOTISM AND THE ORIENT.

It is sometimes observed that as orientals have always been used to despotic government, they appreciate only autocracy; they can neither appreciate nor are fit for self-rule. In the first place, it is not a fact that despotism has been the prevailing form of government in oriental countries in all ages. We have already given some idea of the different kinds of government which prevailed in India of the past,—which were more or less democratic in character. It would not, however, have mattered much, if we had been accustomed only to absolutism in the past. Western peoples who now have republics or limited monarchies in their country had been at some time or other of their history governed despotically. As for oriental countries, Japan has had representative government for the last fifty years, growing very powerful and prosperous in consequence. China,

though not out of the woods yet and though under a sort of dictator, is a republic. The insurrections caused by the attempt to convert it into a monarchy show how deep-rooted and widespread the republican feeling is in China. Even under Manchu rule and earlier still, the Chinese had always enjoyed a large measure of local autonomy. A constitutional monarchy, with a parliament, has been established in Persia also; but the conflicting interests and intrigues of European powers have prevented the Persians from showing their capacity for self-rule. The success of Japan alone, however, demonstrates that oriental peoples may be capable of self-government.

SELF-RULE IN THE INDIAN STATES.

In the Indian States, known as the Native States, the Rulers, the principal officers and the subordinate officials are Indians. Mysore, Baroda, Gwalior, Travancore, and several small states are on the whole as efficiently governed as British India. Some of them are superior to British India in material prosperity, in education, in the encouragement of industrial development, and in respect of the separation of the judicial from executive functions. No doubt, the British Government has helped the Indian States by guaranteeing protection from external aggression and prevention of internal revolts, and occasional advice given, by political residents. But the people of British India, too, do not demand the immediate severance of the Indo-British connection; Home Rule under the protection and guidance of the British Empire is the demand of Congress and Moslem League alike.

Geographically and ethnologically Nepal is a part of India. Nepal manages its own affairs without British protection and guidance. It is true that neither the Feudatory States of India nor Nepal can hold their own against a leading European power. But Belgium, Serbia and Montenegro have not been able to defend themselves against the Teutonic powers. The Teutonic powers could conquer Denmark and Holland also, if they liked. Do the British, the French and their allies for that reason call in question the capacity and the right of the Belgians, the Serbians and Montenegrins or of Holland and Denmark, to govern themselves? Or would it be right to do so?

The objection may be urged that the

power to manage the affairs of the *small* Indian states is not a proof of the capacity to administer the affairs of a *large* Empire like India. Our reply is twofold: (1) If our capacity to govern the small Native States be admitted; why cannot we in British India, leaving imperial politics alone, have self-rule in the provinces, or in the Divisions or in the Districts, or even in all the municipalities? 'The peoples' hands are tied even in village unions. (2) In the second place, the Colonials in some of the British Colonies have to deal with small areas and small populations. Their success in managing their affairs has been considered a sufficient proof of their capacity to lead some British Cabinet ministers in recent months to promise that when the war is over, they shall share in the government of the Empire. Lord Chelmsford, a former governor of New South Wales and Queensland, and a London County Councillor, has been thought fit to be appointed Viceroy of India. Why cannot then the successful work of the great ministers of the Native States, like Salar Jang, Seshadri Iyer, Dinkar Rao, Romesh Dutt, &c., be taken as a proof of Indian capacity to deal with imperial politics? Some of the independent European countries, too, are small, yet nobody questions their right and capacity to govern themselves. The following tables will afford a basis for comparison between some of our states, some British colonies and some European countries.

<i>Indian States</i>	Area in sq. miles	Population
Gwalior	25,107	30,93,082
Travancore	7,129	34,28,975
Baroda	8,182	20,32,798
Mysore	29,459	58,06,193
Hyderabad	82,698	1,33,74,676
<i>British Colonies</i>		
New-foundland	40,000	2,40,000
New Zealand	1,05,000	10,00,000
New South Wales	3,10,400	16,50,000
Victoria	88,000	13,20,3000
Queensland	6,70,500	6,06,000
<i>European Countries</i>		
Belgium	11,373	75,71,387
Denmark	15,582	27,75,076
Holland	12,582	62,12,701
Switzerland	15,976	38,31,220
Montenegro	5,603	5,16,000
Serbia	18,650	29,11,001

We could have given the figures for the South American republics like Chile, Argentine Republic; &c., but it is unnecessary.

POWER OF SELF-DEFENCE.

Anglo-Indian papers like the *Englishman* say :—

"A country which is *unable to stand by itself* in all things, to finance itself, to defend itself, is obviously not ready to govern itself."

Is there any British colony which can stand by itself in all things? Can any of them defend itself? But for British Imperial protection Japan could annex Australasia, and the United States could annex Canada. On the outbreak of the Boer war, it was Indian troops who landed first in the British South African Colonies to defend them. But, though the British colonies cannot defend themselves, they are not considered unworthy of self-government.

Is France able to defend herself, standing alone by herself? Obviously not. For, then British troops and Indian troops would not be on French soil to defend France. Is England able to stand all alone in self-defence? Obviously not. For she has requisitioned the aid of her allies and her colonies. The help of even poor despised India could not be dispensed with; for her sons have been sent to fight for the British Empire in Europe, Asia and Africa. Germany could not stand by itself. It depends on the help of its allies. It does not then seem to be axiomatic that a country which cannot defend itself with its own resources alone is "not ready to govern itself."

FINANCIAL INDEPENDENCE.

As for financial independence, we do not know whether there is any civilized country in which foreign capital is not invested. Not to speak of Asiatic countries like Japan, China, Persia, &c., which are self-ruling, European countries like Russia are being developed with foreign capital. Even in England there are millions of German money invested, and, similarly there is British capital invested in Germany. During the present war England has been obliged partly to finance her allies. As for herself she has had to go to the American market for money. It would seem then that financial independence could not be taken as an essential qualification for self-government.

It may not be irrelevant here to point out that England owes her present opulent condition to capital taken from India. Readers of Mill's *History of India* and Brooks Adams's *Law of Civilization and Decay* know that British industrial development would not have been possible without transferring to Great Britain much of India's hoarded wealth, amounting to hundreds of millions.

"ROME WAS NOT BUILT IN A DAY."

We are often reminded by both Indians and Anglo-Indians that "Rome was not built in a day." It is meant thereby to tell us that as England and other free and self-governing countries took centuries to evolve and learn to work their present advanced political institutions, India ought not to expect to become self-governing in the course of a few years. From the historical primers which we read at school, we did indeed learn that it took Rome centuries to grow from the collection of huts, which Romulus and Remus probably built into a city of palaces and cathedrals with magnificent suburban villas. But in later times, it did not take as much time to build Washington, Melbourne, Sydney, San Francisco, Chicago, or new Dacca; nor is it expected that new Delhi or new Bankipur would take centuries or even decades to build. The present up-to-date steam-engines of various sorts can trace their descent to Hero's apparatus, constructed B. C. 130. If a student of mechanical engineering now wants to learn to make a steam-engine, he does not begin with making Hero's machine, nor does he learn the art in $130+1915=2045$ years. He becomes a finished mechanic in a few years. The marvels of modern chemistry have grown from the days of the alchemists in the course of centuries. But the modern student of chemistry learns the science not by toiling for centuries through a hundred births and re-incarnations, but in less than a decade. The youth apprenticed to the ship-building trade does not begin with dug-outs or canoes, but with the most up-to-date vessels, mastering the art of building the latest merchant vessels and dreadnoughts in a few years. The modern mechanic who wants to manufacture all sorts of weapons for the army and the navy, does not go to a museum to see how the palæolithic and

the neolithic men made their stone hatchets or flint spearheads, and arrow-heads in order to imitate them. He learns in the course of a few years to make machine-guns, 14-inch cannon, shells and torpedoes. The modern Japanese did so learn from the West, and are now teaching and helping the West in some cases. When 50 years ago the Japanese youths who subsequently came to be known as the Elder Statesmen, went to all the most civilized countries of the world to learn the art of government, they did not bother their heads with the witenagemot and the corls and the ceorls and the enihts, but at once set about to learn and did learn in a few years all that there was to learn about the latest, representative institutions and their working; and the school of experience afterwards made them what they became.

The art of statesmanship, like all other arts, is and can be learnt in a single life-time. The British baby, who afterwards grows up into a statesman is born just as ignorant as the Indian baby. British infants are no more born with the general's baton or the statesman's portfolio than are Indian babies born with the coolie's spade or stone-breaking hammer. Given the same opportunity and facilities, the Indian baby is sure to equal any other baby in development. If statecraft were entirely or mainly inherited, all or most of the descendants of all or most statesmen would have become statesmen, and few boys whose fathers were not statesmen would have become statesmen. Abraham Lincoln would then have been impossible. Mr. Asquith has learnt what he has in his own life-time, Count Okuma has learnt in the same space of time, so has Dadabhai Naorji; so did Asoka, Chandragupta, Samudragupta, Sher Shah, Akbar, Aurungzib, Shivaji and others. Their ancestors did not pile up knowledge and experience of statecraft for them and physiologically transmit it to them. There may or may not be some truth in hereditary talent or racial characteristics; but it has always been a conscious or unconscious trick on the part of the few in possession of power and privilege to try to persuade the many outside the pale to believe that birth is the sole or most dominant determining factor in the making of the destiny of individual and nations. In India the trick succeeded to so great an extent that for generations

Sudras have continued to our own day to believe that it was only by acquiring merit after numerous births that they could become Brahmans or twice-born. But now the spell seems to have broken even in India. Many persons hitherto known as Sudras now claim to be twice-born.

The evolution of a thing or the discovery of a truth or method takes a long time, involves great labour and may require much genius, but to acquire a knowledge of them is a very much shorter and easier process.

It does not require generations or centuries to learn statecraft, though it may have taken centuries to evolve and perfect the art; just as it does not take generations or centuries to learn any other art, science or craft, though the latter may have arrived at their present state of perfection or maturity after centuries. In the case of all the other arts this fact has been tacitly admitted; in the case of statesmanship or statecraft, however, it seems to be denied. But facts with their incontrovertible logic have come to the rescue of all struggling and aspiring nations. It is within living memory that the Serbians, Bulgarians and Rumanians have become free after long centuries of subjection to Turkey. They did not take centuries or generations to learn statecraft, but began to manage their affairs efficiently as soon as they got the chance to do so. It cannot be urged that they are more intelligent or brave than the Indians, or that their civilisation is of older date than that of India. If it be urged that they are Europeans, and what is true of Europeans cannot be true of Asiatics, we can cite the case of the Japanese, who, from the commencement of the Meiji or new era, began to govern their country in the most approved fashion. The Japanese possess an ancient civilization which, it may be urged, fitted them for their new career of political progress. But the Filipinos have not started with any such real or supposed qualification; and yet they are satisfactorily exercising the right of self-rule after an apprenticeship of less than a decade under American administrators. Should it be urged explicitly or by implication that our only disqualifications are that we are Indians and that we have been under British rule for more than a century and a half, we must throw up the sponge and confess to being thoroughly beaten.

CAPACITY FOR SELF-RULE RELATIVE: NO ABSOLUTE STANDARD OF FITNESS FOR SELF-RULE.

There is no absolute standard of fitness for self-rule. Like every other kind of capacity, the capacity for self-rule is relative. There is no nation on earth which is absolutely, perfectly fit for self-rule. From the very fact that they are all self-ruling it must be acknowledged that the English are fit, the Irish are fit, the Germans are fit, the Belgians are fit, the Montenegrins are fit, the Japanese and the Chinese are fit, the Ethiopians are fit, the Negroes of Liberia are fit, the Negroes of Haiti are fit, the uncivilised Maori and Gilbert Islanders are fit, the Serbs, the Boers, the Bulgars, the Filipinos and the Afghans are fit, the Nepalese are fit. But have they all made equal progress, or are they all equally powerful? God has not fixed the exact degree, kind or measure of capacity which would entitle a nation to self-rule; nor is it possible for any man or nation to fix the standard. The British people in general think that they are perfectly fit for self-rule. But have they always been able to show sufficient ability and tact in the administration of the affairs of their own country? If they had, there would not have been so many revolutions, rebellions and riots and so much bloodshed in their history. Like all other peoples they have occasionally committed great blunders. They have blundered even in the course of the present war. But even the most serious mistakes are not held, and justly so, to disqualify free and independent nations for self-rule. What then is the validity of the objection that Indians being inexperienced would often go wrong if allowed to govern themselves, and they ought not, therefore, to have self-rule? The man who never made a mistake never did anything of any value. The infant who never fell or stumbled, never learnt to walk. Nations learn and become strong and progressive both by their failures and successes.

BRITISH CAPACITY FOR GOVERNMENT.

In their own country the British have shown great administrative ability. But they have not shown equal ability in India. They have, indeed, prevented foreign aggression and established and maintained peace and order in the country, they have very regularly and strictly collected and

spent the revenue, they have on the whole dealt out even-handed justice between Indian and Indian and, in civil cases, between Indians and Europeans, but during their nearly two centuries of rule they have not been able to make Indians equal to the peoples of the least advanced European countries, and of Japan, in education, in material prosperity, in health, in power of self-defence against external and internal aggressors and in the enjoyment of immunity from the depredations of robbers and wild animals. Among the civilised countries of the world there is no country which is so subject to famines, and pestilences and other epidemics. In 17 years the Americans have made the Filipinos more literate and more free from malaria than we have become in 150 years. Japan has attained greater success in fighting malaria in Formosa than our government in India. The good that has resulted from the work of the bureaucracy in India we admit; but judged by the standards we have spoken of, particularly by the two main and essential tests of intellectual and material advancement, the success of the bureaucracy has not been such as to justify them in arrogantly declaiming against the incapacity of the Indians. The relatively poor success of the British Government in India is all the more noteworthy, as the natural resources of India are vast and varied and her inhabitants are not wanting in intelligence, courage, industry, thrift, sobriety and other good qualities of character.

CHARACTER.

Character is one of the chief factors which determine capacity for self-rule. The crime statistics of India compared with those of some of the most civilized countries show that we are not inferior in character to other civilized peoples. Corruption and misappropriation of public money are certainly not more rife in India than in the United States of America. During the centuries during which England has had parliamentary government, prime ministers and men in both higher and lower political positions have been known to be corrupt and wanting in personal integrity. Recent enquiries relating to the Civil Service in England have brought to light glaring instances of nepotism. The assumption that Indians are unfit for self-rule, because there occasionally come to

light cases of nepotism, municipal or other jobbery, embezzlement and corruption, is preposterous: when made by Indians it shows both the very high standard by which they judge themselves as well as their ignorance of the state of public morality in other countries, when made by Westerners, it is either pharisaical and pecksniffian or is due to their ignorance of the state of things in many Western self-ruling countries.

• LOCAL SELF-GOVERNMENT.

Local self-government in India has been, on the whole, as successful as one could reasonably expect from the little freedom enjoyed by the local bodies. Our roads, drains, &c., are not now in a worse condition than when the officials alone were entirely responsible for their upkeep. The Bombay Government has recently granted to several municipalities the right to elect their presidents. The Bengal Government has recently given the municipalities a free hand in the preparing of their budgets, saying,

"The Governor in Council is satisfied that the experiment has on the whole justified itself, while at the same time he notices in the affairs of municipalities a growing sense of responsibility and capacity for self-management, which encourages him to believe that further confidence in their powers of financial administration would not be misplaced.

These are indications that local self-government has not been a failure.

LITERACY.

It has been sometimes asserted that India cannot be self-ruling because of the prevailing illiteracy. In the mouth of the bureaucracy it is a very curious argument. They have not cared to make India more literate than she is. Education is progressing at a snail's pace. In Japan 28 per cent of the children of school age were at school in 1873; by 1902-1903 the percentage had risen to 90. In India the percentage is 19.6. When the shears of retrenchment have to be applied, education is the first to suffer, though at the same time the emoluments of the Indian Civil Service may be increased. It was owing to the opposition of the bureaucracy that Mr. Gokhale's Elementary Education Bill was rejected. Our boys are willing to learn and to pay for their tuition, but there are not schools and colleges enough for them. The people cannot open schools and colleges in sufficient numbers because of the standard of

requirements set up by the Education Department.

However, when nearly 50 years ago representative government was established in Japan it was mainly the Samurai who were literate; among the rest of the population education was not widespread. In India, too, the higher classes, particularly the males, who alone at present take part in public life, are educated to a considerable extent. And as in all countries representative institutions have been worked in the earlier stages by the higher classes, it would be enough for the purpose of Indian Home Rule if a sufficient number of educated and capable men could be had to represent the people in the local, provincial and imperial councils. And it is well-known that this number can be had.

England has enjoyed representative institutions for centuries, but education has been widely diffused there only during the last century or so. In the age of King John, when the barons wrested the Great Charter from him, many of the nobility could draw spear-heads more skilfully than the letters of the alphabet; book-learning was despised by them. In later ages of parliamentary history, too, literacy was not the prevailing feature of English society. In other free countries, also, free institutions and a high percentage of literacy have not always gone together. However, if literacy be considered an essential qualification for self-rule, it is in the power of the rulers to attain the requisite standard within a decade. A century ago India and China were about the most literate countries in the world. It may be possible for us to overtake those who have since then left us behind. Our rulers do not, in actual practice, however, seem always to care much for education. For Government have often nominated men to sit in the provincial and imperial councils who do not know English though the proceedings of these bodies are conducted in English.

"IF THE BRITISH WITHDREW FROM INDIA?"

There is one argument which the opponents of Indian self-rule consider a clincher. They say: "If the British went away from India, leaving her to her fate, she would fall a prey to some other powerful nation, as her sons would not be able to defend her against foreign aggression; and these new conquerors would undoubtedly be worse than the English." In the

first place, the present Indian demand is for Home Rule, *not Independence*; so why should the British withdraw? No doubt, a self-ruling India would not keep so many highly paid English officials, nor would it be so good a field for commercial and industrial exploitation as it is at present; though that is a somewhat distant contingency. But still some Englishmen would find employment here as they do in the self-governing colonies, and there would still be a sufficiently large and remunerative field for the investment and employment of capital, as there is in the British colonies and in the independent countries of Russia, Turkey, China, Persia, &c. Where the honey is there will be the bee, too: It is not in human nature to leave a place where there is hope of gain.

Standing by itself no British colony can defend itself against foreign aggression. It is the might of the British Empire which shields the colonies. Why should not the Empire extend the same help to India on the same terms? Why should England demand from India as the price of defence the monopoly of power, of high appointments and of opportunities for exploitation?

We know the colonials are white and we are not. We are not the kinsmen of the British people. Therefore perhaps the underlying idea in the minds of many Englishmen may be: "Why should we care to defend your country if the bargain be that we are to receive all the blows and you are to receive all the blessings, we are to do all the hard work, and you are to roll in wealth and luxury?" But as we have been often told by many English notables that England's work in India is philanthropic, it would be highly noble of Englishmen and extremely creditable to them if, from altruistic considerations they remained in India to defend it even after the grant of Home Rule to India, until we were able to do so ourselves. Should it, however, be considered a very unconscionable bargain, we would respectfully suggest that in future Englishmen would do well not to lay exclusive stress on England's philanthropic mission in India.

It is not exclusively our fault that we are unable to defend ourselves. As both Sir S. P. Sinha and Mr. Haque have said and shown in their addresses, Government have not helped us to be strong, have even kept us weak.

There is a way out of the difficulty. Indian soldiers have given unquestionable proofs of soldierly qualities. In the pre-British period and in the early days of British rule, people of every province of British India could and did enter the army. That practice should be revived, and Indians should be trained both as privates and commissioned officers in all sections of the army, including artillery. An Indian aerial fleet and an Indian navy should be built, manned by Indians. In this way England could yet make India self-dependent as regards her defence. It may still be England's proud boast that she had made India stronger than she had found it;—it is not so now, perhaps the reverse. If England did her duty in this respect in the way suggested, it would be to her advantage also. For the present European war is certainly not the last great world war. In the next, and perhaps still more terrible and destructive, war, England would require the help of a strong India. If India were not strengthened, England might have to regret it. As for ourselves, we are accustomed to adversity, and ought to be able to face the hardest decrees of providence with unblinking eyes. For who know whether it would not be necessary for India to pass through the fire of still greater tribulations than in the past before she reached the goal of her high destiny by getting rid of her fatal weaknesses? It is for England, prosperous, happy England, to consider whether she would be able to meet adversity in the same way.

For, under present circumstances, so far as human eyes can see, England and India require each other's help. We know it; whether the proud prosperity of England has blinded her to it or not, we do not know. Perhaps England thinks that she alone is indispensable to India, but not India also to her. All this humanly speaking. The real fact may be that each may be able to do without the other, that each may even be better for parting company with the other in a friendly way. But we do not know what lies hidden in the womb of futurity. Time will show.

INTERNAL TROUBLES.

Another serious consequence which is apprehended to follow from the imaginary threatened withdrawal of the English from India in case we insisted upon having self-rule is that there would be no end of sectarian, racial, and caste fights in India. But, we again ask, why should they withdraw? And, particularly, why should they withdraw before making India strong and united? But supposing they obstinately insisted upon withdrawing and carried out their threat, what would be the result? We have briefly dealt above with the contingency of aggression from without. As for internal troubles, the history of all countries, including European, shows that no country has been entirely free from them in every age. Internecine wars

and civil wars and riots have occurred in all countries. After a time either the conflicting parties have composed their differences or some have gained the upper hand

THE LADDER OF CIVILIZATION.
Rungs by which mankind hopes to reach
the ideal From Puck

and thus somehow or other order has been re-established. What has happened in other countries would happen in India also. We are not a particularly quarrelsome people. In addition to racial or sectarian or class fights, which we sometimes have in India, too, Westerners have their labour and capital riots, their suffragette fights, their election riots, which we have not got in India. Should the English leave India, we might have the good sense not to indulge in mutual fighting at all. If we fought, the state of disorder would not be everlasting; peace and order would return exactly in the same way or ways as in other countries. It is true that when the different European nations were fighting for supremacy in India, there was great anarchy and disorder, and the English gradually evolved order out of chaos. But such periods of disorder are to be found in the history of every country and continent. They are not peculiar to India. Had India been particularly and always a land of disorder, it could not have become a prosperous civilised country. One single proof of its former prosperity should be conclusive. It is that from remote antiquity various nations of the West have sought to monopolize the trade of India. As for its civilization, Sir Thomas Munro wrote even so late as the first quarter of the last century that if there were at that time an exchange of that commodity between England and India, England would gain by the import cargo. A country does not grow civilized in the midst of chronic disorder. That India of the future might possibly remain free from racial or sectarian riots even though the English were not to be here as policemen and peace-makers, would seem to be indicated by the fact that in the Native States there are not so many "religious" riots as in British India.

But we do not really see any reason why the English should withdraw from India, nor believe that they will.

CONCLUSION.

We are not unfriendly to the English, nor anxious that they should leave our shores. There is no race which has a fully developed and all-sided manhood. International contact and intercourse are advantageous to all. What we want is room, opportunity, freedom, to grow in all directions. We do not want

to be repressed, suppressed, or exploited. Our aim is self-development, self-realization, self-expression, and the giving to the world what we are peculiarly fitted to give. We know our aspirations are just, legitimate, and righteous, and therefore we should not be afraid of consequences. We know it is to the interest of Englishmen not to withdraw from India. But if they do, we should not be anxious. For it is not Englishmen, it is not Europeans, it is not Westerners, who made us or who guide our destiny. A Power superior to all made us and is moulding our lives. Our destiny is in His hands, and next to His, in ours and in those of other races.

We are not perfectly fit for self-rule;—no nation is. We are not entirely unfit for self-rule;—no nation is. Fitness grows by practice and exercise. We want to grow more and more fit in that way, which is the only way.

The youngest Indian Chemical Researchers.

Although for the sake of convenience chemistry and physics are treated as distinct sciences they are in reality one, and should be included in the comprehensive name of physical science. The line of demarcation between the two is fast disappearing, and many problems have begun to be solved of late years with the joint aid and co-operation of both physics and chemistry. This close interlinking of the two sciences has given rise to the new branch of physical chemistry. One of the most renowned exponents of this science is Svante Arrhenius of Stockholm, and Wilhelm Ostwald is its great apostle.

In our country Mr. Nilratan Dhar has been the first to take to it assiduously, and an account of his work has appeared in this Review from time to time. It is gratifying to note that Mr. Dhar has recently been awarded a State-scholarship in consideration of his researches, and he is now pursuing his favourite subject at the Imperial College of Science, London.

Messrs. Jnan Chandra Ghosh and Jnanendra Nath Mukherji have already given ample promise of their capacity to follow in the footsteps of Mr. Dhar. They have occupied the first and second places respectively in the recent M.Sc. examination of the Calcutta University, and *both submitted theses based on original researches*. Ghose's investigation on "Electrolysis by Alternating Currents,"

Mr. Juan Chandra Ghosh, M.Sc.

Mr. Jnanendranath Mukherjee, M.Sc.

published in the *Journal of the American Chemical Society*, has been highly spoken of. Mr. Mukherji has struck out a new line—the chemistry of colloids. Many important chemico-physiological problems can be properly understood and solved only by a systematic study of this class of bodies, and the two papers bearing on this subject contributed by Mr. Mukherji and also published in the above journal, throw much light on the dark intricacies of the constitution of the colloids. We congratulate the governing body of the Palit Endowment on having secured the services of the two young enthusiastic workers, who have barely passed their teens, as assistants to the Palit Professor of Chemistry. It is understood that in due course they will be engaged as Assistant Professors of chemistry.

Messrs. Dhar, Ghosh and Mukherji are among the most favourite pupils of Dr. P. C. Ray. In his recent opening Calcutta University lecture on the "Pursuit of Chemistry in Bengal" the Doctor referred to them as well as other young workers in the field.

A Bombay Sculptor.

A gentleman wrote to us from Bombay last November :—

"While going over the pages of your issue for the current month, I find in your notes a paragraph advocating patronage for Indian Artists, at least in the case of Indian subjects, in statuary. You have rightly put forward the claims of Mr. Mhatre, who is an artist of great eminence. The art of sculpture seems to be progressing at a great speed in India. Almost on the heels of Mr. Mhatre I can point out to you another artist in Mr. V. V. Wagh who has opened a studio in Bombay. You have commented upon the imperfections of the bust of Sir Rabindranath Tagore made by foreign artists. I send you herewith a photograph which conveys a rough idea of the model made by Mr. V. V. Wagh of the great Poet, and you can judge yourself the merits of the likeness. This model was seen by many of the Tagores in Calcutta, the nearest relations of the great Poet, and they were all unanimous in saying that it was a faithful likeness. I remember Mr. Wagh telling me, on his completing this model, that the head of the great Indian poet

Bust of H. E. Lord Hardinge

By V. V. Wagh.

was as difficult for portraiture as it was unfathomable in intellectual power.

"Then again, Mr. Wagh had sittings from H. E. the Viceroy, when H. E. was giving sittings to another European sculptor. In spite of the fact that Mr. Wagh got very few sittings, compared with those obtained by the other, the model turned out by Mr. Wagh was so successful that after seeing this model Her Excellency the late lamented Lady Hardinge lost no time in sending to Mr. Wagh the following appreciation, through the P. S. to, H. E. the Viceroy, who writes:—

24.3.11,
Viceregal Lodge, Delhi.

Dear Mr. Wagh,

Her Excellency The Lady Hardinge has asked me to let you know that she is highly pleased with the bust you have prepared of H. E. The Viceroy and thinks it is an extremely good likeness.

Please allow me to congratulate you on your success.

Yours very truly,
(Sd.) J. H. Dubonlay.

"As I have a copy of the photograph of this model, I send you one."

Bust of Sir Rabindranath Tagore.

By V. V. Wagh.

Success in War and Aeroplanes.

The Aero Club of America (New York) tells the public in a bulletin that the earlier successes of the Germans in Russia were due to their superiority in aircraft.

The comparatively small German forces, possessing a large number of aeroplanes and experienced aviators, had such a tremendous advantage over their foe that they were able to advance through difficult country and take fortified places in spite of the overwhelming numbers of the Russian Army. In a summary prepared by Henry Woodhouse, a governor of the Club and managing editor of *Flying*, the following statements are made:

"The success of the Germans, who, with 1,200,000 men, have succeeded in forcing the Russian Army, which has more than twice as many men, to retreat, abandoning strongly fortified places, has been due entirely to:

"1. Failure on the part of the Russian army chiefs to recognize the possibilities of employing aeroplanes to good advantage for reconnoitering, and directing artillery-fire; co-operating in the work of cavalry and infantry; and in protecting the Russian lines from the prying eyes of the efficient German air-scouts, who,

unchallenged, not only mapped, but secured detailed photographic plans of the Russian positions and distribution of forces.

"2. Failure on the part of the Russian army chiefs to recognize the necessity of shifting of front and of making strategical moves to offset the advantage gained by the enemy through having more and superior aeroplanes and aviators.

"3. The small number of Russian aviators, and their lack of experience, due to not having maneuvered with the troops before the war.

"4. Lack of aeroplanes to co-operate with Russian artillery in directing gun-fire.

"5. Lack of sufficient numbers of aeroplanes and equipment at the disposal of the Russian aviators, which would have enabled them to operate with maximum efficiency.....

"At the beginning of the war there were about eight hundred aeroplanes in Russia, and about one thousand in Germany. But Germany had about one thousand fully trained aviators, whereas Russia had only about four hundred, most of whom had only qualified as pilots and had not had any experience after that in military work. The aeroplanes available in Russia were of many types, with different kinds of motors and different controls, and men who had only operated one type of machine for a short time were not able to pilot other types. Many of the machines were light monoplanes, equipped with only fifty horse-power motors, and had to be discarded.

"A few large Sykorsky aeroplanes could not be used for a time because they required large fields for starting and landing. Aside from this they are much slower than the German machines, and are easy targets for anti-aircraft guns. For these reasons, the ten Sykorsky biplanes that have been in commission during the past six months could not render maximum service.

"Whereas German aviators have each had an average of four aeroplanes ready for their use, the Russians had to wait for their machines to be 'tuned' up. The Russian aviators, lacking experience, went out only occasionally, and saw little; the German aviators maintained a constant air patrol, and brought back detailed accounts and photographs of the Russian positions."

Science counts in these days in warfare as in all other mundane affairs. The practical lesson for us in India is that India should have aeroplanes with trained Indian aviators. The aeroplanes which the Panjab is presenting to the British Empire should, when the war is over, be brought back and kept in that province in order that Panjabi young men may be trained in aviation. Elementary justice would demand the adoption of such a course.

"The Cycle of Spring."

"The Cycle of Spring," published in the present number of this Review, is a kind of exposition and synopsis which Sir Rabindranath Tagore has written of his two delightful and deeply significant Bengali dra-

matic pieces, *Vairagya-Sadhan* (Practice of Renunciation) and *Phalguni* ("Of Spring-tide"). These were played the other day in the family residence of the Tagore family in Jorasanko in aid of the famine-stricken people of Bankura. Sir Rabindranath, who is a master of the histrionic art, himself took a leading part. Mr. Gaganendranath Tagore, Mr. Abanindranath Tagore, C. I. E., and a few other members of the Tagore family also appeared on the stage. The other players were for the most part teachers and boys of the Bolpur school.

Verily, as the poet teaches, there is a cycle of never-ending rejuvenescence in the universe. Winter is Spring in the making, and Life lurks disguised in Death. Thus is Fear cast out and senility is seen to be a myth.

Mr. Mazharul Haque's Presidential Address.

HINDU-MOSLEM UNITY.

In his perfectly sane and judicious presidential address at the recent Bombay session of the Moslem League Mr. Mazharul Haque, referring to a class of critics of "the old school who had made a bogus of the Congress" said :—

They think it dangerous that the Hindus and Mahomedans should come together and unite for the progress of India and, therefore, they want to keep them as far apart as possible. These views have long since been exploded and I do not think it worth while to refute them at this late hour of the day. Now every thinking man fully realizes and is thoroughly convinced that, unless the whole country unites and strenuously works for the advancement of the motherland, no isolated effort can gather that momentum which is requisite for our regeneration.

INDIAN CIVILIZATION A COMPOSITE WHOLE.

Mr. Haque gave expression to the correct historical view that Indian civilization is "the outcome of the combined efforts of all the peoples of India." He spoke of Islam in India as follows :

The first advent of the Muslims in India was along these very coasts in the form of a naval expedition sent by the third Khalif in the year 636 A. C. This was more than four hundred years before William the Conqueror defeated the Saxons at the battle of Hastings. After many vicissitudes, into the details of which it is unnecessary to go, the Muslim Empire was firmly established in India. These invaders made India their home and did not consider it a land of regrets. They lived amongst the people of the country, mixed with them freely and became true citizens of India. As a matter of fact they had no other home but India. From time to time their number was strengthened by fresh blood from Arabia, Persia and other Muslim lands, but their ranks were

swollen mainly by additions from the people of the country themselves. It is most interesting to know that out of the present seventy millions of the Muslim population, those who have claimed their descent from remote non-Indian ancestors, amount only to eight millions. Whence have the remaining millions come, if not from Indian ranks? The Muslims enriched the happy civilization of India with their own literature and art, evolved and developed by their creative and versatile genius. From the Himalayas to Cape Comorin the entire country is studded with these gems of art which remind one of the glorious period of Muslim rule. The result was a new civilization which was the outcome of the combined efforts of all the peoples of India and the product of the two greatest civilizations in the history of the world. During Muslim times all offices were equally opened to all, without any distinction of class, creed or colour. The only conditions were fitness and efficiency. So we have the spectacle of a Hindu prime minister, a Hindu commander-in-chief, Hindu finance minister and a Hindu governor of Kabul. Ethnology and folklore of India speak eloquently of manners and customs showing the influence of one people upon the other. The only link which the Muslims kept with the countries outside India was the spiritual link of their religion. This was under the circumstances inevitable. Islam enjoins a brotherhood which in my humble opinion is much wider and more catholic than the modern European notion of nationality. It embraces peoples of different races, colours and countries within its fold, whilst it does not exclude the binding forces of nationality. Arabian history is full of instances when Musalmans and Christians fought side by side to defend their country from the attacks of foreign foes. These are the facts of history written in large letters, and those who run may read them. This short historical retrospect may be succinctly expressed in two words which fully and clearly describe the elements and conditions of our existence in India. We are Indian Muslims. These words, 'Indian Muslims,' convey the ideas of our nationality and of our religion, and as long as we keep our duties and responsibilities arising from these factors before our eyes we can hardly go wrong.

"WE ARE CONQUERORS," NOT THE CORRECT ATTITUDE.

When Mr. Haque said that out of the 70 millions of the Muslim population of India those who have claimed descent from remote non-Indian ancestors amount only to 8 millions, and that the remaining millions have come from Indian ranks, he unconsciously protested against the arrogant attitude of those of his co-religionists who consider Indian Muslims conquerors and look down upon the Hindus as conquered. The fact is the majority of Indian Musalmans are only the co-religionists, not the descendants, or kinsmen of the former conquerors of the greater part of India, just as the Indian Christians are the co-religionists of the British rulers of India, not their descendants or blood relations. Moreover, as caste is not so strong among Muslims as among Hindus, of the

8 millions of Muhammadans who claim descent from foreign ancestors there can be but few who can claim continuous unmixed descent from a foreign stock. Like many of the Mughal Emperors, most, if not all of them, are partly Indian and partly foreign. And even if some could claim unmixed descent from foreign stock, it would be as unwise and absurd for them to assume airs of superiority and look down upon the Hindus, as it would be for the present-day descendants of the Norman conquerors of England to adopt a similar attitude with regard to the generality of Englishmen. Apart from the fact that when England came to be recognized as the suzerain power in India, the Indian Moslems had *really* yielded the palm to the Hindus, we all now have the same political status or rather want of status, just as in Great Britain the descendants of the Britons, Angles, Saxons, Danes and Normans are all politically equal. It is also good logic to say that if A's ancestor defeated B's ancestor, it does not follow that B is inferior to A, or that A's descendants have got the right in perpetuity to crow over and insult B's descendants.

IN POLITICS, INDIAN OR MUSLIM?

The question has often been asked and answered whether Indian Muslims are Indians first and Muslims afterwards or the reverse. Here is Mr. Haque's answer:—

When a question concerning the welfare of India and of justice to Indians arises I am not only an Indian first, but an Indian next and an Indian to the last, an Indian and an Indian alone, favouring no community and no individual, but on the side of those who desire the advancement of India as a whole without prejudice to the rights and interests of any individual, much less of any community, whether my own or another. But whenever any question arose on which there was a clear and unmistakable Divine injunction conveyed to me by my God through my Prophet, I could not even consider, let alone accept as correct, anything conflicting with that injunction, no matter on what mundane authority it was based. With Divine authority as my only guide I will be not only a Muslim first, but a Muslim next, a Muslim to the last and a Muslim and nothing but a Muslim. People may scoff and laugh, but I hold firmly to these convictions. In the affairs of my country I stand for good-will and close co-operation between all communities, with a single eye to the progress of the Motherland. If we look sufficiently deeply into the different questions affecting India we should find hardly any which does not affect all equally. Are we less heavily taxed than are our Hindu or Parsi brethren? Do the repressive measures passed during recent times weigh less heavily upon the Musalmans than upon the Sikhs or the Marhattas?

Are the newspapers of Muslims more free than those of the Hindus? Does the administration of justice produce different effects upon the different communities of India? Are the rigours and invidious distinctions of the Arms Act reserved only for the martial races, and are the non-martial free from them? No. The truth is that in essential matters such as legislation, taxation, administration of justice, education, we are all in the same boat, and we must sink or swim together.

As to the duties which Moslems owe to themselves Mr. Haque gives the first place to

SELF-RELIANCE.

For too long have we relied upon others. It is quite time that we got rid of unreliable and temporary props, stood upon our own legs and became a self-reliant people. For too long has our policy been regulated by distrust and dominated by fear. We have unnecessarily feared and distrusted the Hindus. We have had an unholy awe of authority and we have never placed any faith in ourselves, but have made ourselves dependent on others. All this must be changed. This policy has kept us from enjoying our rightful share in the public life of our country, to the great detriment of our best interests. We must have independence, and open our eyes in the fresh air.

WHAT THE BRITISH GOVERNMENT HAS DONE.

England has given to India the inestimable blessing of peace. She has maintained order amongst us. She is protecting us from external invasion and internal anarchy. She has given us a settled Government. She has brought the inventions of Science to our very doors. Lastly, she has freed the intellect of India from its cramped prison, wherein it was able to rise no higher than a blind adherence to rather out-of-date authorities. To my mind this is the greatest blessing that British rule has brought in its wake.

WHAT GOVERNMENT HAS NOT YET DONE.

Mr. Haque expressed the opinion that "from an Indian point of view, the things that have been left unaccomplished are the things that really matter in the life of a nation."

England has borne the burden of India, but has not prepared her to bear her own burdens. She has not made her strong, self-supporting. She has not made her a nation respected by the other nations of the world. She has not developed the resources of the country, as it was her duty to develop them. She has not helped the Indian people to live a life of the greatest possible usefulness. She has failed to bring out the capacities of the people of Hindustan to their fullest extent. England's connection with India has lasted for about a century and a half and most parts of the country have been under her direct rule during this period. But the progress India has made with all her vast resources, material, moral and economic, is comparatively very small. Compare her with other countries. Compare her with Japan. Within 40 years Japan, from being one of the weakest and most backward countries of the world, has advanced

to the position of one of the foremost and the most highly developed nations and is counted among the great Powers. But in the case of India, the government of the country has been conducted on lines which were not conducive to any better results. The children of the soil have no real share in the Government of their own country. Policy is laid down and carried on by non-Indians which oftener than not goes against the wishes of the people and ignores their sentiments.

Policies and principles of a nobler kind may be laid down by higher authorities, but their value is determined by those who have to carry them out. Thus it has often been the case in India that noble intentions have degenerated into pious wishes and even into harmful actions. If the Indian people were real partners in the actual governance of the country, the Indian point of view would have prevailed, much that is now admitted to have been mistaken would have been avoided, the country would have progressed and the ruling classes would have been spared the bitter and sometimes undesired, criticisms hurled against them. Unless and until India has got a national Government and is governed for the greatest good of the Indian people, I do not see how she can be contented. India does not demand 'a place in the sun' in any aggressive sense, but she does require the light of the Indian sun for her own children.

INDIANS AND THE PUBLIC SERVICES.

In addition to the ordinary higher and highest civil posts in the land which were practically closed to Indians, Mr. Haque laid claim for his countrymen to the posts of Political Residents and Agents in the Indian States and said that he saw "no reason why picked Indians should not be accredited to the courts of countries outside India, as ambassadors and plenipotentiaries, and why the post of consuls should be reserved for Europeans only." The higher ranks of the military service, and the naval service should, in his opinion, be opened to Indians.

RECONSTRUCTION AND SELF-GOVERNMENT.

The reforms which Mr. Haque demanded were, he said, "neither immediate nor peremptory."

We can wait and must wait till the end of the war, when the whole Empire will be reconstructed upon new lines; but there is no harm in postulating our demands now and informing the British people of the unity and the intensity with which the reforms are insisted upon. When the affairs of the Empire are taken into consideration, our views should be before the English nation. Of course we cannot expect that India will change in the twinkling of an eye by some magical process, but we do hope that a new policy will be initiated which will end in self-government and give us the status and power of a living nation. The reforms must come steadily, but surely. But hope deferred maketh the hearts sick, and delay deprives the reforms of all their grace. If you ask me to give you an indication of the reforms which are immediately needed, I would say that the first step towards self-government must be taken by abolishing the packed official majority in the Imperial Council.

We must have a sure and safe elected non-official majority, which would discuss and deal with all Indian questions from the Indian standpoint. The late Lord Minto was quite right when he recommended this very reform which I am placing before you now. Next, we must free the Executive Council of the Viceroy from the incubus of the bureaucracy. Then fierce light would be thrown into the dark corners of Indian administration. We must have more Indians in the Executive Council, which is really the chief source from which policies emanate. In England the members of the Cabinet are not drawn from the official classes, but from the non-official. Again, a great reform that is needed is what has been called "Provincial Autonomy." Provinces are now working within the circumscribed limits allowed by the Government of India. In domestic affairs and finance they should have the fullest liberty of action. Local Self Government should not be a mere sham, but based on real foundations as contemplated by that noble Viceroy, the Marquis of Ripon. The Arms Act must disappear from the Statute Book and no limitation should be laid on the entry of Indians into any Public Service, as I have clearly indicated in my speech. Volunteers should be enlisted freely from all classes. Agriculture must be improved and Commerce and Industry helped. Education will have to be free and compulsory.

Sir S. P. Sinha's and Mr. Haque's Addresses.

We do not think it is either necessary, expedient, or desirable to pronounce any opinion as to the relative merits of the presidential addresses delivered by Sir S. P. Sinha and Mr. Haque, though their views may be compared, contrasted and criticized, where they lend themselves to such treatment. But several papers have extolled Mr. Haque's address at the expense and to the disparagement of Sir S. P. Sinha's, speaking of the latter as being less advanced, less courageous, less favourable to home rule, &c., than the former. We are, therefore, constrained, against our will, and in justice to Sir S. P. Sinha, to say what we think. As we had no opportunity of seeing Mr. Haque's address before it appeared in the Calcutta dailies on the 31st December, on which date our January number was published, it was not possible for us to say anything on this subject earlier than this number. We have already bestowed on Mr. Haque's excellent address the praise that it deserves. But Sir S. P. Sinha's address is not less courageous or statesmanlike than that of the Moslem leader. In fact, Sir S. P. Sinha's ideal of self-government is more clearly conceived, more thoroughgoing and fuller in outline than that of any other president of any Indian congress or conference or league that we can call to mind at the

present moment. Of course, our memory may play us false, nor can we pretend to have read all presidential addresses. Sir S. P. Sinha no doubt said : "The goal is not yet." But Mr. Haque, too, said :

Of course we cannot expect that India will change in the twinkling of an eye by some magical process, but we do hope that a new policy will be initiated which will end in self-government and give us the status and power of a living nation. The reforms must come steadily, but surely.

Sir S. P. Sinha said exactly the same sort of thing.

In our last number we pointed out that Sir S. P. Sinha ought to have said something on the recent repressive measures and on the Indian Civil Service Temporary Provisions Act, which he did not do. Mr. Haque's address is free from this defect. Regarding the Indian Civil Service he said :

Why the examination should not be held both in England and India to give the youths of both countries equal chances is an anomaly which passes my comprehension. For a number of years the country has been loudly demanding this much delayed justice, but instead we get the recent Indian Civil Service Act which has entirely abolished the competitive system. No doubt the operation of the Act is temporary, but a wrong precedent has been created, and no one knows to what further developments it will lead.

His observations on the two recent repressive measures, the Press Act and the Defence of India Act, and the way in which they have been worked, leading to the disappearance or dragging on of a lifeless and miserable existence of several papers, and the internment of many Moslem leaders and others were just and outspoken. His criticism of the "men of blood and iron" was well deserved. It is these portions of his address which must have brought down on him the wrath of many Anglo-Indian papers.

The passages in Sir S. P. Sinha's address which dealt with the Arms Act, the right of Indians to become volunteers, to obtain commissions in the army, to enter the navy, and the right of men of all provinces to become soldiers, were, as far as our memory enables us to judge, never surpassed or equalled by any similar utterance of any other Indian leader in courage and clearness of expression and impassioned, though statesmanlike and irrefutable, logic.

Dr. Ray on the Pursuit of Chemistry in Bengal.

Professor P. C. Ray's inaugural Calcutta University Extension Lecture on the

pursuit of chemistry in Bengal was very instructive. It had the eloquence of facts and was consequently rousing and hope-inspiring. About a century ago, in Germany, to quote Liebig's words, "it was a wretched time for chemistry." But in the course of two decades, he and Wohler "by their epoch-making discoveries almost revolutionised the views of chemists on organic chemistry; in fact one may go so far as to say that they created organic chemistry."

GERMANY IN 1823.

However, neither of these great apostles could catch inspiration in their native land. The former went to Paris to learn at the feet of Gay-Lussac, and the latter preferred to repair to Stockholm in 1823, to be initiated by the great Swedish chemist Berzelius. The line which these great pioneer chemists borrowed from Paris and Stockholm was rekindled with vigour on their return to Germany and has been ever since burning with increased and dazzling brilliancy.

ENGLAND IN 1837.

England, though she could boast of a Boyle, a Priestley, a Cavendish, a Dalton and a Davy, was, however, slow to follow in the wake of the chemical renaissance in France and Germany. Up till the forties of the last century she was found lagging behind in the race. Liebig, who visited England in 1837, writing to Berzelius naively says; "England is not the land of science; her chemists were ashamed to call themselves chemists because the apothecaries had appropriated the name." According to Sir Edward Thorpe there were not in 1837 more than a couple of dozen persons in the British Isles altogether receiving systematic instruction in practical chemistry and even that supply was probably fully equal to the demand. There was in fact little to tempt men to take up chemistry as a means of livelihood. Teacherships were few in number, analytical chemistry as a profession hardly existed, and chemical manufacturing was done by rule of thumb, and for the most part very badly done."

Such, said the Professor, was the state of things in the forties in England in the last century, and such is the state of things in the India of to-day, so far as chemistry can offer attraction to young men as a means of livelihood.

It is scarcely too much to say that 99 per cent. of our University students who take up chemistry do so simply because it happens to be a branch of the Science curriculum, and they have to give it up and forget all about it as soon as they have secured a degree. Yet in the midst of such discouraging and depressing circumstances we must cultivate our favourite science.

But we must not be daunted. Where other nations have succeeded we can also attain success, provided we have the requisite devotion and zeal. Intellectual capacity we have. Our struggle is only with poverty. Scientific workers in pre-

vious ages had to carry on their investigations under much more adverse circumstances.

DIFFICULTIES OF THE PIONEERS OF SCIENCE.

If we read carefully the history of the different branches of science we invariably find that they have attracted votaries in the early stages of their progress in the midst of almost insuperable difficulties. You all know that Copernicus held back the publication of his great book "On the Revolutions of the Heavenly Bodies" for 36 years for fear of giving offence to the all-powerful Church; that Bruno was burned at the stake for teaching the plurality of worlds, and Galileo visited with the terrors of the Inquisition for his vindication of the Copernican doctrine. Nay, Roger Bacon, one of the precursors of our own science, was thrown into prison and had to rot in a dingy cell of a cloister at Oxford for practising the Black Art, as chemistry was then called. Browning in his "Paracelsus" has delineated the wrestlings and inward longings of an ideal alchemist, who is only an honest seeker after truth, who pursues knowledge for its own sake irrespective of what it brings. Voltaire tells us that at the time of Newton's death there were not 20 readers of the *Principia* out of Britain. These great and mighty interpreters of the laws of nature cared not for name or fame, but considered themselves lucky if only they could be instrumental in giving to the world the results of their lifelong labours. Kepler had imposed upon himself years of incessant toil including midnight vigils in observing and recording the motions of heavenly bodies; and after embodying the results of his labours he exclaims, "I may well wait a hundred years for a reader, since God Almighty has waited six thousand years for an observer like myself."

If Europe is what she is to-day—if she is in the van of scientific progress—it is in no small measure due to the self-denying ordinances of these great heroes in science and their worthy successors.

To those who intend to pursue chemistry in India the Professor could not promise a rich harvest in the immediate or near future.

Those who are pioneers in this field have no traditions to go by or follow up; they have to chalk out their own path and formulate their own schemes and carry them out as best as they may. Difficulties arise at every turn but with faltering steps the weary pilgrim must keep marching on towards the goal, happy if he reaches it but equally happy if he perishes in the attempt.

He added in a different connection.

I have always been reluctant to appeal to the sordid instincts of man in giving a stimulus to the cultivation of science. I prefer to take our stand on a higher platform. The heroes of science some of whose names have been mentioned in the earlier part of my address have always pursued their favorite branches with a singleness of purpose and without an eye to material gains and neither penury nor persecution could damp their ardour and they have left priceless legacies as the common heritage of mankind. As a new light flashes across the mind of the inquirer or as he hits upon a novel discovery, which has made him lose his sleep and appetite for days and months

he is seized with ineffable joy often bordering upon delirium and unconscious of all that is around him is led to exclaim—*Eureka*. "The vocation of a student of science is sacred—he is a citizen of the world—he transcends all artificial barriers of race and nationality.

Yet within the last twenty years or so during which original investigations in chemistry have been earnestly carried on in Bengal, that science has added a little to the material prosperity of the country.

MATERIAL ADVANTAGE

The Bengal Chemical and Pharmaceutical Works had its birth and early struggles in the dark and dingy rooms of a house not far from this place and it started with the modest sum of Rs. 800. With the recent expansions which have already been taken in hand it will soon cover an area of 24 bighas (8 acres) and its present capital of 5 lacs will have to be doubled with a view to the installation of new plant. It has always been a fixed principle with the Directors of this business not to take in any one as a chemist whose knowledge is not up to the M. Sc. standard of our University. There is another matter—rather of a delicate nature—which may not be passed over in silence. The works has been conceived, initiated and managed solely by Bengali brains, energy and pluck and it has never been necessary to call in the aid of any foreign "experts." Perhaps you may be interested to know that owing to the serious dislocation in chemical trade due to the war and the stoppage of supplies from Germany it has been doing a roaring business in some lines; e. g., magnesium sulphate is being turned out by tons and a consignment has been shipped to England; it has also been its privilege to be of some little help to Government in the matter of supply of acids, etc., for munition. If I have at all referred to this chemical works in my address it is only to demonstrate that the successful application of science to industry is by no means incompatible with Bengali genius.

INTELLECTUAL GAINS.

In the field of intellectual progress, too, the results, though small, have not been discouraging. Among the Professor's own students can be named original investigators like Prof. Panchanan Niyogi, Messrs. Rasik Lal Datta, Nil Ratan Dhar, Rajendranath De, Jitendranath Rakshit, P. K. Dutt, Jnan Chandra Ghosh and Janendranath Mukherji, and Drs. Biman Bihari Dey and Hemendra Kumar Sen Gupta (both D. Sc.'s of London University on the strength of their theses). The Dacca Laboratory can boast of "Messrs. Brajendranath Ghosh and Sudhamoy Ghosh, who have also just won Doctorates of the London and Edinburgh universities respectively on the basis of their theses." "Mr. Anukul Chandra Sarkar, the first Ph. D. of our University in Chemistry, has amply proved that travelling abroad is by no means a *sine qua non* for completing one's chemical education." Within

some 20 years as many as 130 communications have been sent to the world's chemical journals from the chemical laboratory of the Presidency College alone. "The laboratory of my friend, Professor, Watson [of Dacca], is also responsible for two dozen or more papers." A monograph on complexions recently published in England quotes Mr. Nil Ratan Dhar as an authority.

In times of peace chemistry has played an important part in the industrial development and progress of the most advanced countries and is destined to play a similar part in all countries. As for war, "even the man in the street realises that the battles which are being daily fought and the new surprises sprung upon the wondering public in connection with this the greatest war since the creation of the world have had their rehearsals in the laboratories of chemists."

WHAT IS WANTED.

Both from the point of view of intellectual progress and material advancement, the pursuit of science is absolutely necessary. We require many colleges properly equipped for teaching up to the M.Sc. standard; we have at present only one. In the University College of Science a promising beginning has been made. But "unless the Palit and Ghosh endowments are adequately supplemented the Science College will not be in a position to start fully on its active career.

I hope Bengal has not seen the last of her great benefactors to our University. I trust another Palit or Ghosh will open his purse-strings in this hour of our dire need. I plead to our Government which has done so much in the past for the progress of education to come forward with a liberal grant.

The University Regulations should be so changed as to make the teaching of elementary science in our schools possible, if not compulsory. That will go to create a scientific atmosphere in the country, which is absolutely necessary. It will also provide honorable careers for some of our science graduates. If rich and poor alike do their part manfully, if the state does its duty in no niggardly spirit, then the dream of the great professor will surely be realized.

A DREAM.

I spoke of Physical Science as an exotic plant in India. Perhaps, I should modify or qualify the expression. Ancient India was the cradle of mathematical and chemical Sciences and I have narrated in

my "History of Hindu Chemistry" how these filtered to Europe through the medium of the Arabs. Indeed, the first Faraday lecturer of the Chemical Society in the introductory part of his lecture observes: "What an awakening for Europe! After two thousand years, she found herself again in the position to which she had been raised by the profound intellect of India, and the genius of Greece." Remember it is to India that the place of honour has been thus assigned by the illustrious French chemist, Jean Baptiste Andrie Dumas. I hope it will be hers once more to hold aloft the torch of Science and assert her true place in the comity of nations.

The Indian Society of Oriental Art.

The Report and audited accounts of the Indian Society of Oriental art for the years 1913 to 1915 form a very interesting publication. Particularly interesting and instructive are the comments of the French and English papers, extracts from which in translation and original respectively have been given in the appendix. To these we have a mind to turn in a future issue.

The Society has been doing very important and useful work in reviving and keeping up interest in the art traditions of India. It is evident that we are already in the midst of an artistic renaissance. The remark that some of the new artists have been imitating or drawing inspiration from Japanese art, though it should serve as accusation, need not discourage us in the least. From the days of Chaucer downwards English literature has owed much for its materials, forms, and inspiration, to Greek, Latin, Italian, French and German literatures. Yet the originality, greatness and power of English literature cannot be disputed or denied.

It is discouraging to read in the Report repeated references to the arrears of subscriptions due from members, the greater portion of them being in arrears. The Society has altogether 120 members, of whom some 47 are Indians, the rest being Europeans. It does not seem a natural state of things that an *Indian* society of *Oriental Art* should have 50 per cent. more non-Indian than Indian members. We do not, of course, know whether the Society has made adequate efforts to get the adherence and support of Indians. It is very easy and pleasant to fulfill the conditions of membership. It is very profitable, too. For, though a subscription of Rs. 24 per annum is said to be payable, as most of the members do not pay, we suppose it is not good form to pay. How otherwise can such large arrears be accounted for? For on hurriedly glancing

through the names of the members, both European and Indian, we can not find any particularly impecunious ones.

We have said, it is very profitable to become a member,—we mean a defaulting member. One hasn't really got to do any thing or pay anything and yet one has many solid advantages, as the following extracts from the Report will show:—

By the courtesy of the India Society, London, our Society has been able to purchase some copies of Mr. Fox Strangway's "Music of Hindustan" for sale to the members at a concession price of Rs. 7-14 per copy, the published price of the work being Rs. 15 per copy. By arrangement with the India Society, London, Mrs. Herringham's monograph on Ajanta paintings (15 colour plates and 30 collotypes) will also be available to members at £3 per copy, the published price being £4 4s. per copy.

Mr. Gangoly's monograph on "South Indian Bronzes," copies of which he has so generously presented to members, is a very interesting study of Indian sculpture based on original sources not utilised by any previous writers, and in its attractive get-up and sumptuous illustrations has met with great appreciation. This work, which has been published wholly at Mr. O. C. Gangoly's expense, and Mr. Tagore's "Notes on Indian Artistic Anatomy" have been issued as free publications to members for 1914 and 1915, respectively. Members requiring additional copies of Mr. Gangoly's work may procure the same from the Secretaries at Rs. 10 per copy, the published price of the work being Rs. 15 per copy.

We have seen Mr. Gangoly's work. It is a very valuable and costly one. Apart from the labour and patience required to prepare such a book, it must have cost him several thousand rupees to produce so sumptuous and profusely illustrated a volume. The other work, a very original, illuminating and valuable essay, *viz.*, "Notes on Indian Artistic Anatomy," is also really a costly production, though the members got it, too, *gratis*; for the illustrations in it having been printed from our blocks, as is the case with some reproductions published and sold by the Society, we know that the blocks alone cost us more than Rs. 200. After all this we must really confess that the *gratis* instinct is getting very strongly developed in us, and we are going to apply for a defaulting membership of the Indian Society of Oriental Art without any avoidable loss of Time.

Though we have said that we do not know whether the Society has made adequate efforts to get Indian adherence and support, we do not suggest that it is easy to get it. From the financial results of our own efforts to popularize neo-Indian Art, and the ridicule and abuse heaped upon us,

it is clear that our people do not yet appreciate it. The papers generally do not even refer to our reproductions of Indian pictures. It would, however, be a psychologically interesting study to enquire why when a publication like the first number of "Indian Ink," issued under European auspices, obtains a loan of blocks from us and reproduces some of our pictures, they meet with a chorus of praise from all those quarters which are usually unappreciative of our efforts. It is also psychologically instructive to find that when the Indian Society of Oriental Art holds its charming exhibitions the papers appreciatively comment upon many pictures which when reproduced in our pages before or after the dates of the exhibitions are entirely ignored by them. Perhaps appreciation, like many other things, has its prejudices, freaks and snobbishness.

The Nation's duty to Professor Bose.

We have said in a previous issue that we owe it to Dr. J. C. Bose to give him a laboratory and some research fellowships for students to receive training under him. He has indeed got from Government a recurring grant of Rs. 50,000 for five years for himself and his assistants and mechanics and a grant of Rs. 25,000 for a workshop. He will also have facilities in the Presidency College. But all this does not mean that a laboratory is no longer needed. Some do not even seem to understand the difference between a laboratory and a workshop. Prof. Bose requires a special laboratory for himself, his assistants and his special students to work in, with a lecture theatre where he can occasionally address both specialists and the general educated public. The laboratory has got to be built and will be built. He has set his heart upon it, and will devote to it all that he can spare. The question for the general public is, who else are going to have the privilege of being associated with him in this institution, which will be both national and cosmopolitan. This college or that may give some facilities, but where are his successors to get their training and where are they to work? Shall the special kind of research of which he is the pioneer be continued in India, or shall the lamps lighted from our torch burn in the West alone hereafter? That is the question for us to answer.

A Galileo, a Newton or a Darwin did not build factories for their nations or bequeath manufacturing processes to them. One ought not to expect every scientific discovery to be directly coinable into rupees, annas and pias. Still, those who ask whether there is any money in Dr. Bose's discoveries may try to guess what money he could have made if he had, like Marconi, followed up and commercialized his discoveries in wireless telegraphy. We expect that the Americans and other go-ahead people will get money out of his crescograph and other apparatus and investigations by improving their agriculture therewith. Should Dr. Bose have time and opportunities to prove vivisection unsatisfactory and unnecessary, by experimenting on plants with drugs, both men and the lower animals will be spared much suffering, physicians and pharmacutists will make money, and India, with her sublime teaching of *ahimsa* (non-killing), will have made a characteristic contribution to the world's treasury of knowledge and morals.

The Famine in Bankura.

We are deeply thankful to all those friends of humanity who from far and near are so generously sending us their contributions for the relief of the famine-stricken people in Bankura. Their contributions are thankfully acknowledged on another page. We regret very much that we are unable to personally thank by letter every one of the donors. We hope they will not find it difficult to forgive us when we say that being in a weak state of health it is with difficulty that we edit and conduct two monthly magazines. The work is exacting and does not leave us any surplus time and energy.

Relief-workers on the spot and others acquainted with the circumstances tell us that the work will have to be continued till July, and that the sufferings of the people will increase from March next, and consequently more help will have to be given. At present all the relieving agencies give only a quarter seer (half a pound) of rice per head per diem, whereas ordinarily the people are accustomed to take from half a seer to a seer per head per day, besides *dal* (pulse soup), vegetables and fish. An appeal has been made to the relieving agencies to increase the doles. It will be for them a pleasant duty to do so, provided they can get the money for the increased expenditure involved. Clothing and blan-

kets have also to be purchased, as the cold in Bankura is rather severe.

An Incorrect statement made by Lord Carmichael.

In the course of the address which Lord Carmichael delivered on the occasion of the prize distribution at Dacca College, he said :—

"What I want to remind you of is that whatever is the help you get from Government, whether you think it great, or whether you think it small—and for my part I think it great—I know of no country where the general mass of students on the average are proportionately so helped by Government as students are here on the average."

This is a glaringly incorrect statement. Of the general mass of students, the majority in all countries are pupils in elementary schools. Now, in the majority of civilized countries, elementary education is free, many countries supplying books, paper, pencil, etc., also free. In some countries the scholars in elementary schools get even free lunches or mid-day meals. How then can it be said that in our country the general mass of students get more help from the Government proportionately than in other countries? Next in number to the pupils in primary schools are the students in secondary schools. In the United States of America even secondary education can be had free by rich and poor alike. How then can our boys and girls be said to be in receipt of the largest proportionate amount of help from the Government? Even in British India in Lord Carmichael's province, the students pay more in fees (Rs. 95,50,070 in 1913-1914) than the contributions from provincial revenues (Rs. 64,99,336 in 1913-14) and local and municipal funds (Rs. 23,92,426 in 1913-14) combined. In every other province the contributions from public funds are larger than the income from fees. The passage quoted above, therefore, could not have fallen less appropriately from the lips of the ruler of any other province than those of Lord Carmichael. In India itself in 1913-14 the Baroda State paid nine-tenths of the total educational expenditure, while in British India, the contribution from public funds in 1913-1914 was only 55 per cent. of the total expenditure. In Baroda and some other Native States elementary education is free, which is not the case in Lord Carmichael's province and most other provinces of India.

Here is what an Englishman who has retired from the Indian Educational Service writes to us in the course of a private letter :—

"The fees here are almost prohibitive. A friend of mine, a Subadar, who had to retire on account of ill-health before he was entitled to full pension and now gets only Rs. 40 a month, has to pay Rs. 11 a month for his son's fees, that is to say, more than a fourth part of his income. I do not think an Englishman who sends his son to Eton or Harrow has to say so much *in proportion*. The young man is reading for the Intermediate."

Considering our backwardness in education and the vast population of India, the state spends exceedingly little in scholarships for sending students abroad. Japan and China, not to speak of Western countries, spend far larger amounts and send abroad a far larger number of students.

Should it be supposed that Lord Carmichael's statement was made only with reference to College or University students, it would still be incorrect. For, to give only one example, in the United States of America,

"Wide diversity prevails at present among American Colleges in regard to fees. The State Universities for the most part charge nothing except for law and medicine....., the state, principally in the West, has been taking over more and more of education, with the consequent elimination of fees from the elementary school up through the university." (*Cyclopedia of Education*, edited by Paul Monroe and published by Macmillan & Co., Vol. II, p. 589.)

Mr. Lyon on the main duty of Government.

In an address, containing advice to students, recently delivered by the Hon. Mr. P. C. Lyon, he said, "it was the inherent right of a nation to govern itself." This doctrine would be all right if it were not in practice officially interpreted to mean that "it was the inherent right of the ever-coming but never-to-come future generations of a nation to govern themselves." Yet it is to be hoped officials would be willing to consider the claim of our great-grandchildren to self-rule;—particularly as Mr. Lyon wished to impress upon his hearers that "the future of this country and the future of Bengal

depended upon themselves and not upon the Government." For, obviously, if the Government and the people were one, their joint efforts could produce results which must be unattainable if, as now in India, the Government considered themselves a different entity from the people, and told the people to depend only upon themselves. In progressive countries Governments do not preach the doctrine of self-reliance *in this form*. There a part of self-reliance consists in making the state organisation subservient to the will and conducive to the welfare of the people. For everywhere the state is the most powerful and extensive organization and the biggest capitalist. Therefore the friendliness, encouragement and direct help of the state is necessary and beneficial in every walk of life, as, for example, the history of the evolution of modern Germany and modern Japan shows; though in Mr. Lyon's opinion, "The main duty of the Government was to preserve peace and tranquillity." We think to preserve peace and tranquillity is only a means to an end, and that end is to promote human welfare, the welfare both of man's body and mind. Mr. Lyon also, perhaps unconsciously, admitted this when he went on to say that without peace and tranquillity there could be no development and progress. But this might be forgotten if it were dogmatically laid down that the preservation of peace and tranquillity was the main duty of Government without laying at least equal emphasis on the use which was to be made of this peace and order. In his recent work on "Political Ideals" Mr. C. Delisle Burns points out how the Roman ideal of law and order is the principle of permanence, as liberty is that of change, both being indispensable for civilized life.

"But order may be paid for too dearly if it is at the expense of liberty. Obviously in giving order to Europe, Rome had taken away all local vitality ... for order cannot imply the limitation of the natural development of what is set in order. If it were so, life would not be orderly, but only death; an order which is inflexible is tyranny,—or in the words of a keen Roman critic, 'we make a desert and call it peace.' " ... as liberty tends to degenerate into license, so order tends to be corrupted into unnatural fixity of the *status quo* ... the order which sacrifices originality, and therefore growth, destroys itself."

In giving order to India, the British Government ought to see that it does not take away all her vitality: already her vitality has been impaired to some extent.

Servants of India Society and the Indebted Poor.

A Press message informs the public that the efforts of Mr. Gokhale's Servants of India Society to introduce co-operation amongst the most degraded of the wage-earners of city, viz., sweepers, scavengers and mill-hands, have produced encouraging results. After a careful study of the conditions under which this class of people live, members of the Society found there was no hope of reclaiming them except by improving their economic condition and educating them so as to organise their credit and start co-operative credit societies. In 1913 three societies for this class of very heavily indebted people were started. The results hitherto attained are full of promise. In two years 14 co-operative credit societies have been formed with a membership of 463. Of these 353 members have been redeemed entirely from debt to usurers, the average debt of each workman being rupees three hundred. Debt to the extent of Rs. 1,10,000 to usurers was reduced to Rs. 87,944 by conciliation and transferred from usurers to the co-operative society. At the same time the rate of interest was reduced from roughly an anna a rupee per month to a pice. Various societies have embarked Rs. 87,944 in redemption of debt. Of this total the members have discharged Rs. 40,033. Thus in two and a half years these societies have reduced indebtedness by nearly one-half and on the balance they are paying quite a reasonable interest. Various valuable offshoots are noted. Members who have borrowed from the societies for debt redemption have insured their lives and 247 such insurances for Rs. 250 each have been effected. A co-operative dispensary has been established and high schools set up.

The War that is always with us.

In these days of human warfare on a titanic scale, it is apt to be forgotten that we have in our midst war of a different, though not less destructive character. Plague continues to levy its terrific toll of thousands of human lives every week.

The plague mortality in India during the week ending January 22nd stood at 6,890 against 8,895 cases. Bombay Presidency and Sind report 2,265 deaths, Madras Presidency 552, Bengal 4, Bihar and Orissa 461, United Provinces 1,193, Punjab 71, Burma 243, Central Provinces 971, Mysore State 143, Hyderabad State 936 and Central India 96.

Who will fight this terrible enemy of the poor ?

U. P. Educational Conference.

It was a most important, influential, representative and successful conference which met last month at Lucknow to discuss the educational needs and formulate the educational demands of the United Provinces of Agra and Oudh. Pandit Madan Mohan Malaviya was elected to the chair. By his ability, his eloquence, and his untiring industry and great sacrifice in the cause of education, he was undoubtedly the fittest man to guide the deliberations of such a conference. Raja Rampal Singh, chairman of the Reception Committee, was quite justified in declaring, "Let us have inefficient education, rather than efficient ignorance." Mr. Malaviya's speech and many of the other speeches were characterized by accurate information and cogency of reasoning. The resolutions covered the whole field of education, general, industrial and technical, for boys as well as girls, from the primary up to the university standard. The speakers rightly emphasized the duty of the state to provide education for the people in all stages. What it could not do directly, it ought to do indirectly by stimulating public liberality. We hope a complete report of the conference will be published early. The conference has shown its earnestness and wisdom by the formation of a permanent committee to look after educational matters. This has not been done a day too soon. The United Provinces were in ancient and medieval times the home of Indian civilization. Their present backwardness is not creditable either to the people or to the State. As the people have begun to show their earnestness, the State is bound to shake off its inertia, and change the obstructive attitude of its officials.

The Science Congress.

Last month Lucknow saw the sittings of the Indian Science Congress, too. This

gathering also was very successful, as men like Prof. J. C. Bose, Prof. P. C. Ray, and others were present and delivered addresses. Considering the state of scientific knowledge in India, it was necessary and fitting that some popular lectures were delivered. India does not contain a sufficient number of original scientific investigators to make it possible yet for its science congress to be a gathering for the reading and discussion only of original papers; though the number of original contributions showed that the day may come when we may have something like the British Association in our midst.

Women on the Education of their Sex.

The women of Bombay and of the Panjab have spoken on the need of education of their sex. Let their sisters in the other provinces follow their example, though it is difficult for the purdah-ridden provinces to do so. As suggested at the Lahore meeting, the Government should associate educated Indian women with itself in its efforts to promote the education of the sex.

Home Rule League still Required.

Even if the Moslem League and the Indian National Congress were both to carry on vigorously propagandist and educative work, the need for a Home Rule League would not entirely disappear. We require an organisation which would be the meeting ground for both Hindu and Moslem, and for men of all shades and degrees of progressive political opinion, which neither the National Congress (even after the recent amendment of its constitution), nor the Moslem League is. Politically, self-rule is the greatest and the most essential need of the country. Combined work for the realization of this ideal is both an education in self-government and a necessity. Combined work in co-operation with one another can alone enable us to understand, appreciate and respect one another better, and in this way produce national solidarity.

MIDDAY

(From the Bengali of Satish Chandra Ray)

BY C. F. ANDREWS, M.A. AND W. W. PEARSON, M.A., D.SC.

I.

How silent is the light !
 What depth is in the clear blue sky !
 The eyes grow weary of the dazzling light,
 The forest depths are plunged in silence.

Who are these that pass so softly by the garden
 Wandering with soft whispers and still softer steps ?
 Ah, my heart, at such an hour, why yield to dark despair,
 Thy lute untouched, thy song of joy unsung.

Hushed in a sudden wonder with wide open eyes
 Life's narrow fretfulness is lost in light profound.
 What a glory of the sun fills the world !
 The light is still. How deep the sky !

II.

To day I am a lone spectator in the silent theatre of the world
 And watch the shadows at their silent play.
 They have come trooping down from the palace of the trees
 And sit still by the lake when their play is done.

The birds restrain their songs
 And fly past again and again.
 The leaves bend low upon the trees
 And hide the blossoming flowers with their kisses.

How silent are the ripples on the lake !
 How soundless is the wood !

EVENING

(From the Bengali of Satish Chandra Ray)

BY C. F. ANDREWS, M.A., AND W. W. PEARSON, M.A., D. SC.

It is Evening and the tired earth with its chequer work of lengthening shade
 rests silently.

The beautiful twilight floods the sky and pours its after glow upon the tops of all
 the trees.

The birds float idly on their painted wings and hover to the ground and sink
 to rest.

Out of the depth of this still beauty the burden of an aching silence draws down
 upon my heart.

A voice that tries to speak to me is sounding through the air, inarticulate.

A scented touch seems to hold me like the blind clinging of the blind.

I have found no rest, no peace.

Where, oh where, is that wonderful word of consolation so full of sweetness
 of rest,—

That word which the sunset skies are seeking to utter ?

The bar to its speech is so frail, yet, unuttered, this silent beauty crushes my heart
 to tears.

THE MODERN REVIEW

No. 111

NOTES

Self-service as Spiritual Discipline.

There are orthodox Brahmins who spend certain periods of their lives, not taking food prepared even by their mothers, sisters or daughters, in the belief that such abstinence is spiritually beneficial. We have no such belief, but it need not be discussed here. The practice, however, has no doubt, a hygienic value; as in cooking his own food a man can be as scrupulously clean as he chooses, and can also avoid the use of stale, rotten or otherwise unwholesome articles of diet. It also to a great extent serves as a check upon luxurious living and gluttony. For though it is quite easy and pleasant to enjoy course after course of rich delicacies prepared by others, it is not quite so easy and pleasant to do the cooking of so many dishes for oneself.

If we try to dispense with the services of others even for a single day, ourselves doing the work of the scavenger, the sweeper, the scullion, the cook, we can realize what we owe to others. Some male persons are apt to have a proud feeling that they are the lords of creation, and that women have been created simply to minister to their wants. But if they attempt to do even for a single day what their mothers, wives, sisters and daughters do for them, it cannot fail to be brought home to them that those who serve are really more important than those who are served, and that the usefulness, the fame and the brilliant careers of men are built on the foundations of what women do for them in the privacy and obscurity of their homes.

A similar line of thought convinces us that we owe a great part of our usefulness to our scavengers and sweepers, to our menials, to the unskilled labourers, the peasants, the artisans, the craftsmen, the me-

chanes, the tailors, the shoemakers, the builders, the carpenters, the blacksmiths,—all, in fact, who toil to make us comfortable for a scanty remuneration. The very fact that we pay and pay small sums for their services serves to obscure and dull the sense of our great indebtedness to them. It may be bad economy for every one to try to do for oneself all that is necessary for one's existence, it may even be impossible so far as the needs and activities of a modern civilized man is concerned; but it is a good discipline for the soul to try to do even part of the work necessary for one's daily sustenance and comfort. It is sure to give one a lively sense of gratitude towards the humble workers of the world and to create true fellow-feeling, instead of that so-called sympathy which in most cases nothing but the pity which fortunate persons patronizingly feel for those who occupy humbler ranks in life.

The greater the man the more is he able to stand in the place of, to identify himself with, the meanest of men in the world's estimation. With the broadening of his fellow-feeling, he becomes more and more universal.

We find it mentioned in Pundit Sivanath Sastri's reminiscences of Ramkrishna Paramhansa, published in the *Modern Review* for November, 1910, that a sage told the Paramhansa "to believe himself to be equal to the meanest sweeper, for instance. Ramkrishna at once resolved to do the duty of a sweeper. By stealth he would enter the *paikhana* or privy of a neighbour from below, and would take away the pots to the river to wash them and put them again in their places." It is given to few to be so thorough-going in the endeavour to universalize oneself; but the effort is worth making as far as one may find it possible.

Business as Service.

Mr. John Farwell Moors, a prominent man of business of Boston, writes in an article on "Ethics in Modern Business" contributed to the *Harvard Theological Review* for January, that "though the object of business is money-making, its essence is service." Facts, he says, in support of this conception face us on every hand.

For example, follow through the day, the most typical of all citizens, the salaried man. A cook serves him with breakfast, his town with a side walk, an eager boy with a newspaper, an engineer with safe conduct to the city. "Bag earned, Sir," is his welcome there. Thereafter both necessities and luxuries are everywhere thrust upon him—collars, fish, custard pies, vacuum cleaners, pyramids of oranges and of apples vigorously shined, on anonymous trousers. A street car takes him to his office building, an elevator to his office, cleaned for him in the cheerless hours of darkness by a woman on hands and knees. Throughout the day a stenographer and office boy do his bidding. At lunch a restaurant serves him. When evening comes, superabundant theatres seek to entertain him. No socialist, however ardent, can conceive greater eagerness to serve. The very streets are congested with people bent on serving one another. The activities produced by charitable agencies are in volume as nothing by comparison. There is, however, a stern condition. The recipient of this service must pay for it. With rare exceptions, ability to pay can come only from the recompenses of service. The service of business is reciprocal.

The service of business is in one respect preferable to the service of benevolence or of friendship,—preferable to what is a "labour of love." When a man receives the service of business, he reciprocates by paying him who serves. In the case of the service of benevolence or of friendship, the person who is served receives a favour from the benevolent, involving loss of self-respect, or he remains under an obligation if the person who has served is a friend. One can do a good turn to a friend in return for his service, but the mere object of charity is rarely able to have the satisfaction of being able to serve those who have done him good as a matter of charity.

"Tiger" Jackson.

On the completion of the fiftieth year of his practice at the Calcutta Bar, his friends gave Mr. William Jackson, Barrister at Law, known as "Tiger" Jackson, a dinner. Mr. Eardley Norton read the following poem on the occasion:—

W J •

Through the thin mists of fifty years
You stand for all that makes our Bar
The stay against official jeers,
The pride of men who were and are.

In your brave hands its fame was safe,
Its proud traditions fresh and sure,
Inviolable from the chains which chafe,
The bruts which tempt, the bribes which lure
Men strive for stars and kindred chaff,
Men baffle on microscopic plan,
You set a nobler epitaph,
"Here lies the larger gentleman"
What higher praise can Envy grudge,
What clearer records lawyers show
Than yours who never feared a Judge
Nor stooped to trick or wound a foe
Still at justice all adorning
As though a boy with your first brooch,
We rise to toast your honoured name,
Impulsive, generous, dear old Chief

R N

This praise is thoroughly well deserved.

What a Criminal might have been.

The judgment in the Benares Conspiracy trial contains the following passage:

We have dealt at special length with the case of Sachindra Sanyal because we regard him as definitely the most dangerous of the accused before us. He was Rash Behari's chosen lieutenant in Benares and his activities have had both a wider and a more sinister character than those of the other accused. We find him at one time in Calcutta, at another at Lahore or Amritsar. There are elements in his character which might have made him a useful and even a noble member of society—as for instance his joining the band of volunteer relief workers in the Damodar floods. The privetized elements have however gained the upper hand and he has become an anarchist of a peculiarly dangerous type, the type of man who inherits to deeds of violence while keeping in the background himself. No sentence short of transportation for life would be at all adequate in his case.

Why men who have the making of a noble character in them become criminals, is not only an important study in psychology that is worth making, but it ought to afford food for reflection to the patriot and the practical administrator as well. Both the social leaders of a country and its statesmen can be said to attain success in their respective roles only when they are able to convert possibilities into actualities.

Nepotism in England.

In discussing the Indian Civil Service (Temporary Provisions) Bill and in abusing the Indian press in connection therewith, some Anglo-Indian papers took it for granted that selection in Great Britain would secure for India the services of the best men. But nepotism exists in England as it does in other countries, as the following extract from the "Bombay Chronicle" shows:—

Nepotism in the English Courts.

The sixth and final Report of the Royal Commission on the Civil Service in England dealing with the Legal Department contains much evidence on the prevalence of old style patronage which is very entertaining. Here for example is a dialogue between Mr. Graham Wallas and Sir Kenneth Muir Mackenzie:—

"Page 5 of the Return sets out the actual names of the masters and assistant masters in the Central Office

Mr. ——— has £1,000 a year, is he the son of a judge?—Yes.

Is Mr. ——— the son of a judge?—Yes.

Is Mr. ——— the son of a judge?—Yes.

Is Mr. ——— the son of a judge?—Yes.

Is Mr. ——— the son of a judge?—Yes.

He is, certainly, a near relation of a late Lord Chief Justice, but not a son.

Mr. ——— is he the cousin of a Lord Chief Justice's wife?—I do not know.

Mr. ——— is he the brother-in-law of a Lord Chief Justice?—Yes."

That accounts for seven out of nine.

How a Job was Secured.

A majority of the Clerks of Assize, most of whom get £800 a year, are also sons of Judges. A first-class clerk in the Central Office of the Supreme Court of Judicature (£700 a year) describes how he heard of a vacancy and got the job:—

"There was a gentleman in the office at the time, who was connected with a friend of my father's and my father asked him to dinner and talked to him after dinner, he heard about the old Court of Exchequer Master's Office, and made inquiries and found that Sir Frederick Pollock had got a nomination."

Again, once the appointments are secured, says the "New Statesman," some of them appear to be very secure. A Clerk in the Probate Registry said that it would be "an act of grace" for a member of his class to retire at the age of 90, if he felt it difficult to get down to the office. As regards some light into the character of the work done in several of the Departments, the following remarks, which passed between Mr. Coward and Sir Samuel Evans, cannot be surpassed.

"We have had one or two of the clerks here, and the evidence of one I have before me. I asked him to give an account of what his day was, and you would be surprised to know how difficult he found it to give an account of what he did in the day?—You mean it would not necessarily produce brain fag."

"With the result that in the end I asked him whether any intelligent person of twenty-five could not learn all that he told us he did in twenty-four hours, and he said: 'Yes, he could', he quite agreed,—and you know these people get very substantial salaries?—They do but that is not peculiar to Somerset House. You will find it in lots of the Government offices, I should imagine."

"One of these people was asked what they did, and he said, 'Well, we help one another'?—That is a very nice feeling, but you think it too costly."

A Progressive Ruler.

The Thakore Sahib of Gondal whose munificent donation of Rs. 5,000 for the relief of the famine-stricken people of Bankura was recently appreciatively

noticed in the papers, is one of the most progressive rulers in India. He "has proved a pioneer of educational progress and of general advancement in the country." The Thakore Sahib himself studied at Edinburgh and obtained the degrees of M.D., and LL.D. He is also an F.R.C.P., and F.R.S., a D.C.L. (Oxon) and a Fellow of the Bombay University. Himself a scholar, he takes a great interest in education and has built a large college, on the hostel system, for the education of the sons of landholders. He established the only Girl's School in Kathiawar and was the first to start a Travelling Dispensary and an Asylum for the maintenance of the poor who are unable to earn their own living. The prosperity of the State can be judged from the singular fact that it is the only State free from taxation, customs, octroi duties, some 10 taxes having been abolished during the regime of the present Chief.

Hindrance instead of Help.

Bombay men who require coal for running their industrial concerns find it cheaper to obtain it from South Africa than from Bengal. If the people had a controlling voice in the affairs of the country obstructive railway freights could have been adequately reduced without any loss of time. In every direction one finds reasons why India should have Self-rule.

Our Sympathy with "Uneducated Indians."

In the course of the address which he delivered on the occasion of the distribution of prizes to the meritorious student of Dacca College, Lord Carmichael is reported to have said:—

"I do think that educated Indians, the proportion of whom is I fancy, bigger in Bengal than it is elsewhere, might do more than they have ever yet done, if they would but try more obviously to convince Englishmen as a whole that educated Indians, though they are in a minority, really have a living sympathy with uneducated Indians, who form a vast majority in this country."

We cannot say that we have no sympathy with "uneducated Indians," as they are our kith and kin, and that not merely in a figurative sense. There are not very many educated Indians who have no uneducated relatives. While many educated Indians are actively sympathetic, as is shown by their carrying on philanthropic work of various descriptions or by making pecuniary contributions to such work, it is probably true that a large number of our

educated countrymen, perhaps a majority, must be said to be rather indifferent to the lot of their poor and illiterate countrymen. As those who are comparatively prosperous are indebted, in no figurative sense, to the indigent for their prosperity, they ought to try their best to repay the debt by a more brotherly conduct.

It is a good maxim which says, "Despise not even the meanest," and Englishmen are not among the meanest. It is not, therefore, beneath our contempt to try to obtain the good opinion of Englishmen. But to sympathize with our uneducated countrymen in order that Englishmen may approve of our mental attitude is not a very worthy motive, nor one sufficiently strong to remove the apathy of the indifferent.

Among Westerners Englishmen are, for obvious reasons, among the slowest to recognize any worth in us which does not pamper their pride or promote their interest. Those of them who owe to India their careers and their wealth have sympathy of a certain kind with our illiterate countrymen. But that is because our unlettered folk have not learned to clamour for political privileges, and the profession of sympathy with them serves as an excuse and palliative for not sympathizing with educated Indians. The typical Anglo-Indian's sympathy is also sometimes of the anthropological variety.

There is no doubt that we deserve to be lectured upon our apathy; but the exhortation ought to come from those who by their *practical* sympathy with the mass of India's population have earned the right to find fault with us. Considering that India is the poorest, the most illiterate and the most unhealthy country in the world under enlightened rule, we do not see how any Englishman, occupying a high or a low official position, can with good grace lecture to us on the lesson of human sympathy. Nevertheless, we shall lay to heart Lord Carmichael's words of criticism and exhortation, but not for the reason indirectly implied in the passage we have quoted.

The Constitution of Cyprus.

In an article in the January number of *United Empire* on "Cyprus To-day" contributed by Mr. Roland L. N. Michell, C.M.G., it is said that "a Legislative Council, as created in 1883, consists of the High Commissioner and eighteen members—twelve elected and six official." Legis-

lative councils in India do not contain such a large proportion of elected members,—probably because India is India, not Cyprus.

Dreaming Bengal.

A railway, about 21 miles long, is proposed to be constructed from Khulna to Bagerhat in Bengal. For this purpose a company has been floated in—not Calcutta or any other town in Bengal, but in far off Ahmedabad. And the capital is only nine lakhs. While commending the enterprise of the wealthy citizens of Ahmedabad, one feels inclined to ask why nine lakhs could not be raised in Bengal. Was the undertaking too gigantic for Bengali brains, Bengali enterprise and Bengali capital?

Exploiters Exploited.

Not content with exploiting backward China and sleeping India, the Japanese are carrying the industrial war into the continent of the exploiters par excellence. *Commerce* says:

The Japanese "Ashabi" states that Messrs. Davis, Summers and Co., Kobe, have exported matches manufactured by the Takikawa Factory, of Kobe, and by the Fujita Factory of Akashi, to Europe, shipping 1,700 cases to Marseilles by the "Shinko-maru," which left Kobe on the 17th inst., and 1,300 cases to Port Said by the same steamer. The "Takata-maru," which sailed on the 7th inst., also carried 155 cases of Fujita matches to London. This is stated to be the first time that Japanese matches have ever been exported to that part of the world in any large quantities. The Nihon Kamijiku Match Co. and the Morita Match Factory are also in receipt of considerable inquiries from London, Paris, Holland, Egypt, etc., but are unable to conclude satisfactory business on account of the insufficiency of hold space available. Match manufacturers have been in communication with the Nippon Yusen Kaisha regarding the provision of adequate tonnage for the export of matches to Europe, and the steamship company has now decided to place at their disposal as much hold space as possible on extra steamers. It is, therefore, expected that exports of matches to Europe will increase hereafter. The "Ashabi" adds that the prices of the matches exported to England and France were about 22 yen for second-class safety matches, thick sticks, and 20 yen for third class. And pray, what is India doing in this matter? Surely India is not going to stand patiently aside and watch this new trade between England and Japan without making some effort to secure her share of the industry.

But this is crying in the wilderness. Neither the people nor the rulers of India are doing their duty. The listening to and telling of stories of the Carmichael handkerchief variety is supposed to be a good substitute for popular enterprise and practical State aid to industries.

An Exhibition of Periodicals.

It is said that an exhibition of European, American and Japanese periodicals is to be held in Baroda, to serve as a stimulant to those responsible for the production of periodicals in India. Speaking for ourselves,—and many others responsible for the production of Indian periodicals will be able to say the same thing, we may say that we have seen many of the best periodicals written in English, and the feeling we have had is that it would not be very difficult to produce reviews and magazines like those in the West if we had sufficient public support. We have, both in the case of this review and of the Bengali monthly *Prabasi*, often spent on a single issue more than the total price of the number of copies printed, but we do not remember to have sold even fifty copies more of these special numbers than of ordinary numbers. In one issue of *Prabasi* we printed the whole of Sir Rabindranath Tagore's brilliant and deeply significant play of "Achalayatan" in addition to the usual contents, but we could not feel that the public had become even curious as to what Rabindranath had written. That was some five years ago. In the *Modern Review*, too, we have published and are still publishing many stories and other productions of Rabindranath which when published in the West in book form are sure to sell by the hundred thousand. We have been doing all this in addition to publishing articles and paintings by some of the best writers and artists in India. What is the result? We began the publication of this review in 1907, and we printed 1,500 copies of the first number. Now after nine years of incessant toil and anxiety and worry, we print only 3,500 copies a month. We should like to ask those who are promoting the exhibition of periodicals in Baroda whether any publisher in England, America or Japan, having a circulation of 3,500 copies a month is able to give the public a better monthly than our humble review. If he can, let us please have a specimen copy of that monthly publication, and if we cannot bring out every month as good a thing as that, we shall not murmur if we are called upon immediately to stop publication. It is far easier to make bricks without straw than for an Indian periodical to emulate the get-up and contents of the Western periodicals having a

hundred times the circulation of their Indian fellows. It may be observed here incidentally that the contents of many of the well got-up Western periodicals are for the most part worthless and promote only mental dissipation.

It is not that no magazine-publisher in India has ideas or brains or even business capacity. What is wanting is sufficient public support. We have more critics and counsellors than customers. Sometimes a man who never bought a single copy of our review would patronize us with superior advice and criticism. If the man had given us cash for a copy instead of criticism, we should have been better pleased; for being in the line we can say without vanity that we have more ideas than amateurs of that ilk, though we always thankfully receive and consider advice and suggestions.

It is notorious that in India a good magazine purchased by a single person is read by ten or twenty others equally competent to pay but having the *gratis* instinct abnormally developed. Yet we have not heard that when one buys a pair of shoes ten of his solvent neighbors also use the pair. It is perhaps forgotten that both shoes and magazines require money to produce, and that both shoemakers and magazine makers depend upon paying customers for their livelihood.

Periodicals have two sources of income, subscriptions and cash sales, and advertisements. In India, Government is a dispenser of considerable patronage even in the case of newspapers and periodicals. Some provincial Governments issue lists of newspapers and periodicals which are allowed to be purchased for school and college libraries; and from one or two such lists that we have seen, it is fair to conclude that it is not the excellence of a publication which leads to its being patronized but rather the degree of fervour with which it adores the bureaucracy: for it is the belief of not a few officials, as it is that of the *Pioneer*, that the difference between the bomb-thrower and the constitutional agitator is one of degree rather than of kind. Periodicals have another and that an insidious and cowardly kind of enemy. The kind we refer to would be evident from the fact that a late Lieutenant-Governor of a certain province thought it worth his while to tell a certain public spirited landholder in a holy Hindu city to discontinue sub-

scribing for a periodical for which the police man confessed to have some liking. The practice of the police of seizing during house-searches copies of some newspapers and periodicals, though these may not contain seditious matter nor may have been ever prosecuted for any offence, checks the growth of business. It is also said that the police have another method of indirectly punishing publications which are not in the good books of official,—the method, namely, of frightening away subscribers by preparing a list of them.

Some of the Indian States seem to have a sort of index expurgatorius. A State in Rajputana for instance, does not allow some dailies and monthlies to be taken, though a certain Christian missionary, being an Englishman, could not be prevented from having his copy of the publication he liked. Though certain British officials consider liberty-loving newspapers to be their personal enemies, the Rulers of Indian States need not have any such prejudice; for even the anarchists do not generally seem to cherish the idea of dethroning these potentates.

The Gaekwar of Baroda is a progressive prince, and a friend of learning. There is no harm in an exhibition of good periodicals being held in Baroda; but an ideal periodical published from Baroda, setting the example to other Indian reviews and magazines would be far better. At present the periodicals published in that State are not better than other Indian monthlies published elsewhere. It is easy to do something sensational, something that would be talked of and furnish topics for paragraphs in newspapers; but an excellent periodical is a more solid achievement, requiring more brains and perseverance.

We have said, Baroda publications are not better than those of other places in India. It is possible, however, that the Baroda State patronizes the magazines of Europe, America and Japan more than other Indian States and British India do. We do not, however, know to what extent it encourages Indian periodicals by its support. Our review is said to be one of the passable monthlies in India. On a cursory glance at our subscribers' list, our despatcher tells us that only two libraries and three school and college reading rooms in Baroda take a copy each of our review. Perhaps Indian periodicals which are better than ours have more customers among the

libraries and reading-rooms in Baroda, but their number cannot be very much more, though there is a distinct possibility of their being more. For the Baroda administration report tells us that there are in that State 363 libraries and 62 reading rooms. Even Baroda, therefore, can do more for Indian periodicals than simply holding an exhibition of European, American and Japanese periodicals.

Most of the large businesses in India are in the hands of foreigners. They do not generally advertise in our journals. They do not like our politics. British publishers do not generally advertise in our periodicals, though some of them send us books for review, some have sent us publishers' puffs for free publication, and one has more than once requested us to buy his books at half price and review them in our columns. It is forgotten that British newspapers and periodicals are able promptly to review books because they are enabled to pay for reviews partly from the money which they get by printing the advertisements of publishers. We and our reviewers are expected to do the work with nothing to live upon. It is true the circulation of our periodicals is not as large as those of British ones. But we know some English-owned and English-edited periodicals, not having half our circulation, have very many more British advertisements than we ever had or can expect to have. British publishers do not send us books for review as a matter of charity; they are men of business and do it as a part of their business expecting indirect return. If they expect that our readers would buy the books we review, why cannot they also expect that our readers would buy the books advertised in our periodicals? As for those of our countrymen who have flourishing concerns, many of them do not advertise at all, and those who do, often prefer British-owned and British-edited journals. That is, for one thing, more "respectable" you know, and possibly more "loyal" too. Many depend for their success on the good grace of the *Burra Sahibs*, including those of purchasing departments, and do not, therefore, like to be included among the "suspects" by advertising in nationalist publications.

We may seem to have written at inordinate length on a not very important topic. But as most people unconnected with the press do not know the conditions which

circumscribe our capacity and, for that reason, ignorantly compare our productions with those of other countries, we have thought it proper to tell the public a little of what we know. All that we know it is neither expedient nor possible to print. The gentle reader will not, we hope, take this Note as a sort of begging circular. We have not in the past been famous for begging for anybody's favour or patronage, nor do we now feel like doing so directly or indirectly. If we have referred to our small circulation (and no other Indian-owned English monthly, as far as we are aware, has a larger), it is not to excite anybody's pity, but simply to show that the educated Indian public are not good appreciators and customers of things made in India. Producers of Indian periodicals are, for the most part, not beggars, they are men of business. If our periodicals are worth their price for the knowledge, stimulus and pleasure they give, men and women who want such knowledge, stimulus and pleasure are welcome to buy them. Others need not. But if they need not buy, they should also not borrow them for a free reading and free advice and criticism. It is customers that magazine-producers need, more than critics, counselors and exhibitors of goods not made in India.

Mr. Tilak on Excise Policy.

A public gathering was recently held at Poona under the presidency of Mr. B. G. Tilak, under the auspices of the local Temperance Association. Mr. Lavate quoted from Elphinstone an observation that Poona before 1818 was the abode of *all vices except drinking*.

Drinking was practically unknown in the district—that was the testimony of a European authority who knew what he wrote about and who was by no means prejudiced in favour of the Peshwas or the people of the district. But since the advent of the British Government, the sale of liquor showed a continuously rising curve. From zero in 1818 it rose to 70,000 gallons in 1878 and is now well-nigh 2 lakhs of gallons a year.

According to a summary of his presidential speech published in the *Mahratta*, Mr. Tilak said :—

The question had ceased to be one of logic or of argumentation, and people had come to a situation where they were at a loss to decide what to do. How was it that the sale of liquor increased from zero to thousands of gallons? The people were abstemious by instinct and habit, their religion was against it, public opinion also was so. If the Government thought that they could not uproot the vice, thereby

they were declaring their inability to manage the business. Let them hand over the management of the department to the leaders of the people and he would guarantee that they would see to it that before long the drunk enemy was expelled, without causing any commotion among the people. If the Government wanted the revenue, he would assure them that the people would readily consent to be taxed in any other way with a view to compensating the Government for the loss of the present revenue. If it was not love of money, what was it that prevented Government from taking successful measures against drunkenness? The Government had long tried but failed to appreciably check its growth. The situation then was this. The Government themselves could not successfully tackle the problem and would not let others do it. Themselves proved unfit for the management of the department, they would not let the Municipalities or other bodies take the matter into their own hands. If they wanted the money, the people were willing to pay the amount they wanted, by taxing themselves in other and better ways. What was to be done in such a situation? The answer was one which would take him directly into politics and he would therefore content himself on the occasion with only saying this: that unless the people made efforts to have the management of the department into their own hands, and divest the revenue authorities of that function, there would be no end to the trouble.

Education the Chief Need of India.

In writing in the *Social Reform Advocate* that "the chief need of India at the present time is a wider diffusion of education," Professor Homersham Cox says what we have thought all along and not only thought but acted upon; as, for a non-educational journal, we have always given great prominence to educational topics. Mr. Cox continues :

To remove the general ignorance of the masses is the fundamental reform without which no other reforms are possible. Some would put sanitation first. It is indeed deplorable that every year in India thousands of lives are lost by preventable diseases. But sanitation to be sufficient requires the intelligent co-operation of the people. In an army it may be possible to impose the orders of the medical officers on the soldiers. But military discipline cannot be enforced on a whole nation. Sanitary regulations, as experience shows, will always be evaded when the need for them is not recognised. The people in general cannot of course have the technical knowledge of the expert, but they must understand in some degree the reasons for the regulations they are required to obey. That is to say, they must be educated.

Many Hindus are now actively engaged in the endeavour to raise the depressed classes. When these classes are educated they will rise in the social scale, and at the same time, acquire a higher standard of manners and conduct. The best means to raise them is to educate them.

So too, if we consider any other reforms such as social reform or political reform, we shall see that the chief reason why they make such slow progress is the want of education. It is well that reformers should exert themselves in the direct advocacy of the reforms in which they are interested, but after all the

most efficient means of promoting them—the diffusion of education among the people.

Mr. Cox then asks what we can do to promote education. He asks this question as he thinks "the question is not what the government cannot or ought to do, but what we ourselves can do." To exert ourselves is less easy but more effective than making speeches about the duties of other people." He then says what we can do.

Every educated adult can give something for education, either from his time or his money. A lawyer in large practice may have no time to spare, but he can give some money without injuring himself. On the other hand, a young lawyer who is just beginning at the bar, may have very little money, but his time will not be so fully occupied that he cannot afford to spend an hour, or at least half an hour a day in teaching. If all who can would do something, it would be possible to give elementary education to, at any rate, a large proportion of the people of India. But many very rich Indians subscribe little or nothing to colleges and schools and as yet only a few Indians do any gratuitous teaching.

As to the way things ought to be done his advice is—

Let us suppose an Indian either by himself or in conjunction with one or two friends can give about Rs. 30 a month to education and consider how he should begin. He must not attempt too much at first. Even if only a few poor children are taught to read their own language something useful has been done, for there is no one even in the humblest classes who does not sometimes need at least to write a letter. By "their own language" we mean the language the children actually speak among themselves, not some official vernacular which they do not understand. Only the simplest words of every day use should be employed in the first reading lessons of a child. It is difficult enough for him to learn to associate the sounds with the written symbols, without the added difficulty of strange words. The practice that prevails in Kulu, Kashmir and the Panjab of teaching a child how to read by means of Hindustani, a language he only imperfectly understands, is deplorable. So too is the introduction into his first reading books of learned words which do not form part of his natural vocabulary. These should only be introduced at a later stage when the difficulties of reading have been overcome. Further the first reading book should not attempt to teach anything new. It should contain nothing but what the child is already familiar with. The attention of the child should be concentrated on learning to read. In all teaching the great rule is not to try to teach too much at once, and to remember that what has become easy for us may be very difficult for a beginner.

Even if an educated Indian cannot afford to give money, he can at least collect a few poor children around him and spend half an hour a day in teaching them to read and write.

Mr. Cox declares in quite unequivocal language that "it is most important that education for the poor should be entirely gratuitous. That is to say, not merely should there be no fees, but books, slates, paper, pencils, pens, should all be supplied

without charge. Even a small fee will keep away many "who would otherwise come."

When the child has learnt to read and write his mother tongue and it is possible to teach him something else, the first thing to consider is what will be useful to him in earning his living when he is older, as for almost all men, and most of all for the poor, that is the chief question. The Professor goes on:

It may not seem much to turn out lads who earn ten or twelve rupees a month; but if their fathers were only earning six it is really a great advance to advance to a higher standard of health and comfort. Now what is useful to the boy probably differs in different parts of India. In the towns, according to our own experience, the most useful thing is a little knowledge of English. A boy who can read and write some English, can almost always earn more than his father was earning, and to enable the boy to do that should, we repeat, be our main object. In shops, railways, presses, a knowledge of English, though it be only slight, is useful, and often procures higher pay. The demand for English too is increasing, as more Indian commercial men deal with England directly instead of through English firms in India.

Economy in Education.

British officials in India are accustomed to resist the demands of education by pleading the lack of funds even in ordinary times. Now that the British Empire is engaged in the greatest war in history the need of economy is felt in every direction, though that has not stood in the way of increasing the emoluments of covenanted civilians and certain other public servants drawing fat salaries. In England public spirited persons demand that there should be no retrenchment in educational expenditure. Mr. Frederick Henderson writes in the *Christian Commonwealth*:

There is this broad and vital distinction between educational expenditure and almost every other form of public expenditure. In the bulk of public work it is, generally speaking, possible to postpone expenditure with no worse result than delay. You go without the desired thing for a year or two—whether it is a street improvement, or a new road, or a public park, or the building of baths—but when you get it ultimately you get it as you would have had it now but for the delay. You can pick up your project where you dropped it. But you cannot do that with education. The work of the schools has to do with but a few years of the life of our children; but they are the formative years. It is work which cannot be postponed and picked up again later on. The child passes on into its life of adult responsibility, and the ignorance, the undeveloped outlooks, the narrowed powers due to any educational neglect during those few formative years will be a lasting handicap, affecting adversely the whole quality of the national life into which such a neglected and starved school generation grows up.

The President of a conference of some 300 working-class organisations interested in education which was recently held in London said that

very dangerous as he felt the action of the authorities in regard to educational economy to be, he was more concerned with it as a symptom than as an actual fact. It was undoubtedly true that those who cared for education were often seriously hampered by the fact that the country as a whole did not care much about the topic. Their primary object was to express so definite an opinion that public bodies would know they must put education in the forefront. They did not want the War used as a means for whittling away the small degree of education which had been secured by years of struggle. They felt bound at this crisis in our nation's history to reaffirm their faith that education was the primary public service, to which others must give way, if there was need for any to give way.

If in England people can speak of "the small degree of education which had been secured by years of struggle," what epithet shall we use to characterise the degree of education which the Indian people receive?

Curtailing Educational Expenditure in Bombay.

The Bombay Government's Resolution on the latest Report of the Director of Public Instruction in the Bombay Presidency contains the following passage:—

The obligation imposed by the present financial situation to practise strict economy in every department of the administration is placing severe limitations on the extension of activities and the initiation of new enterprises in the field of education. But the resultant state of affairs is not without its compensatory advantages. The advance in educational work has been so rapid of recent years that a period of suspension, which will afford opportunities for the examination of methods and results and the consolidation of achievement, may prove generally beneficial.

The alleged rapid advance in educational work in Bombay cannot be fully realized without some comparison. There is a book called "Education in Japan" written by Mr. W. H. Sharp, now Director of Public Instruction in Bombay. We gather from that book that in Japan in 1873 the percentage of children receiving primary instruction was estimated at 28. It rose to 51 in 1880, and to 91 in 1902-03. For some of the succeeding years the percentages are: 1907-08, 97.38; 1908-09, 97.80; 1909-10, 98.10; 1910-11, 98.14; 1911-12, 98.29. In the Bombay Presidency after, say, a century of British rule only about 26 per cent of the children of school-going age are under instruction. It is clear, therefore,

that the spread of education has been far more rapid in Japan than in Bombay. Yet what does Mr. W. H. Sharp say in his book on this rapid educational expansion in Japan? Here are his exact words:—

But speedy as the growth has been, we need not, therefore, look upon it with doubt, or fear that Japan will go back upon her steps. "The bamboo lacks not strength because of the rapidity of its growth; it is inflexible as steel, though it may sway idly in the wind." *

Evidently the Japanese people and government did not think it necessary that there should be "a period of suspension which will afford opportunities for the examination of methods and results and the consolidation of achievement"; nor did Mr. W. H. Sharp feel any misgiving about Japanese education when he wrote his book. Has he now changed his opinion regarding the risks involved in educational expansion in general, and did the Government of Bombay write the passage we have quoted after consulting him? Or should that Government be given the monopoly of the credit for inditing such a wise passage?

What the Bombay Government has actually done.

In pursuance of the policy foreshadowed in their Resolution on the Director's Educational Report, the Bombay Government issued sometime ago a circular announcing that the strictest economy was to be observed as far as the educational activities of the Presidency were concerned. It is enjoined that the strictest economy is to be observed in public expenditure on education and a similar policy of retrenchment is to be pursued in regard to aided institutions, so far as the disbursement of Government grants to them is concerned. For the present and until further notice, no educational institution can be newly placed on the aided list, nor can any building or equipment grant be promised to an institution already on such list.

We cannot sufficiently condemn this policy of misguided economy, whether pursued in Bombay or elsewhere in India.

Lord Willingdon on Education.

Some of Lord Willingdon's pronouncements are pro-education, though no hope can or ought to be derived from them. Speaking at the prize distribution to the successful students of the Bombay Scottish

* A. M. Knapp.

Education Society, and referring to the deficit anticipated in the building fund of the John Common High School of some thousands, he said :

"Let me appeal to you to wipe off in a few days this deficit entirely. War or no war, it is needless to say that the education of young children must go on, and I am perfectly confident, knowing as I do the generosity of the citizens of Bombay, that people will come forward to wipe off this deficit."

In January last His Excellency, after formally opening the building built by the Marwari community of Bombay for the Hindi School known as Marwari Vidyalyaya, congratulated them on the great step they had taken for the education of their young men.

One lesson, he said, which the present war had taught them was the need of education in this country, for it was owing to the want of education that there was an inclination among ignorant people to believe every false rumour and report that was circulated in regard to the war.

Local Self-Government and the Bengal Government.

The Bengal Government have done right in giving the municipalities greater freedom in framing their budgets. It is also better than no forward move at all that they are considering whether they ought to give all municipalities elected non-official chairmen instead of nominated official chairmen which some still have. In the Resolution on Local Self-Government issued in April last, the Government of India approved of the proposal for substituting elected non-official chairmen for nominated official ones, but left it to the discretion of provincial governments to act or not to act in accordance with this view. The reform has long been demanded by the press and public of India and is in consonance with the recommendation of the Decentralization Commission. In Bengal there are 85 non-official elected and 27 official nominated chairmen. All these facts leave no doubt as to what the people would like and what, therefore, Government ought to do. Still the Bengal Government have asked the municipalities concerned whether they would prefer elected non-official chairmen to nominated official ones. These local bodies should at once send a unanimitous express telegram to the Bengal Government in favour of elected non-official chairmen.

Judicial Reforms in Hyderabad.

We learn with pleasure from the "Bombay Chronicle" that a rather important measure of judicial reform is just about to be carried into effect in the Nizam's Dominions. Our contemporary says that in Hyderabad, as in most of the bigger Indian States, there are a number of wealthy jagirdars, who, like feudal lords of medieval days, enjoy quite wide powers of civil and criminal jurisdiction over the population permanently residing within their "jagirs." As is to be expected, the administration of justice, as conducted by these territorial lords, who do not possess any judicial training, is not as good or uniform as it ought to be. With a view to remedy this defect and to bring the administration of civil justice in these "jagirs" into line with that obtaining in the territories directly under the control of his Highness's Judicial Department, the Nizam, on the advice of a Committee who went into the question in all its details, in consultation with the jagirdars, has issued orders in which is embodied a scheme for the proper administration of justice in the jagirs. Irrespective of the fact whether the ancestors of any Jagirdar enjoyed any judicial powers or not, a general scheme based on the area, population and revenue of the jagir, has now been drawn up for adoption in all the jagirs.

The main features of this scheme are as follows:—

No jagirdar or paigahdar will be allowed to exercise the powers of a High Court within his estate. Powers corresponding to those of a divisional judge in civil cases and of a sessions judge in criminal cases will be granted to those estates only which have an annual revenue of five lakhs or more. The salary of these divisional or sessions judges shall on no account be less than Rs. 600 a month. If any jagir or paigah cannot maintain a judge on the prescribed pay, the jagir or paigah concerned shall forfeit its claim to exercise such judicial powers. If the amount of work is not sufficient to engage the whole time of these judges, the High Court of the Nizam may allow him to attend to other work also. While the selection of the judge will rest with the jagirdar, the appointment shall be made subject to the sanction of Government after obtaining the opinion of the High Court. The appointment of district civil judges and district magistrates, on the same system as above, but on a lower scale of pay and with lesser authority, is sanctioned for minor jagirs. Appeals from these jagir courts shall lie to his Highness's High Court and sessions courts and district courts as the case may be. There are also other safeguards provided against mal-administration of justice in the jagirs.

Our contemporary observes :—

On the whole the measure is bound to cleanse and vivify the slow moving administrative machinery of the State, and his Highness as well as his able Secretary, Mr. Hyderi, deserve credit for initiating so bold a measure which is also a step in self-government in these jagirs.

An Unmeaning and Puerile Boast

Speaking in the Imperial Council on the prevention of malaria Sir Edward Maclagan is reported to have said :

While accepting the resolution to encourage vigorous measures for the prevention of malaria, the Government of India do not wish it to be assumed that they assent in the view that their action hitherto has been remiss in this matter. It would not be possible in the first place, for the Government of India to say with any confidence that malaria is increasing in extent in the country generally. No doubt there are areas, in which there has been a marked increase of malaria, but there are others, in which there has been an equally marked decrease, and so far as the figures at our disposal go, they give us nothing upon which we can properly assume that there has been any marked increase in the disease during the last few years. This, however, is a matter into which it is unnecessary to go at present. Whether malaria has increased or not, it is notoriously a very prevalent and deadly disease, and it is our duty in any case to do the best we can to cope with its ravages. Here, I may say, that the Government has been in no way remiss.

I think it may be said without dispute that, as regards the measures for research and prevention in connection with malaria, more has been done by the Government in the last ten years in India than has been done by all the Governments of this country during all the centuries that had preceded it.

If the public cannot say that, *taking the whole of India*, malaria is increasing, Government, as represented by Sir Edward Maclagan, with all their powers of collecting information, could not also say that it was decreasing. It is to be presumed, therefore, that there has been no marked decrease. In Bengal, which may be characterized as the home of malaria, deaths from fever numbered 23.40 per mille in 1914 against 21.30 in 1913 and 20.54 as the average of the past five years from 1909 to 1913. In the Central Provinces and Berar deaths from fevers were 16.86 per mille in 1914 against 14.05 in 1913. In these two provinces, then, malaria is on the increase.

But the most amusing and puerile passage in Sir Edward's speech was where he said that, "as regards the measures for research and prevention in connection with malaria, more has been done by the Government in the last ten years in India than has been done by all the Governments of

this country during all the centuries that had preceded it." Sir Edward Maclagan forgot when indulging in this boast that in the ages when Musalman and Hindu kings ruled India, there was no malaria research anywhere in the world; consequently there was no such research in India, too. If he could show that in other countries, the contemporaries of the Indian Musalman and Hindu Kings had adopted measures for research and prevention in connection with malaria, while that duty was neglected in India, his boast would have some meaning and relevancy. But the fact is, as the Encyclopædia Britannica says, "the true nature of the disease remained in doubt until the closing years of the 19th century." "The first substantial link in the actual chain of discovery was contributed in 1880 by Laveran, a French army surgeon serving in Algeria." It may be said generally that the steps which have been taken in many countries to stamp out malaria are subsequent to that date, long before which India had ceased to have any indigenous independent rulers.

If an Englishman were to boast that his countrymen had laid down more miles of railway in India than any pre-British Indian government, that they had performed more surgical operations under anesthetics, diagnosed more diseases by taking x-ray photographs, sent more wired or wireless messages, or had given more bioscope performances than any Hindu or Musalman kings of India, these boastful words would be about as worthy of an adult statesman as the claim made by Sir Edward Maclagan in the Imperial Legislative Council of India in the year 1916 of Christ.

Filipino Independence.

Regular readers of this Review know that the Americans have promised to make the Filipinos independent within a measurable distance of time, that they have been preparing them for it, and that they have already given them self-rule to a far greater extent than India enjoys. Their hope of independence has come much nearer realization by the decision arrived at last month by the Senate of the United States of America to withdraw American sovereignty from the Philippines within not less than two and not more than four years. This decision will become final and have

effect only when it has gone before and been accepted by the House of Representatives, of which there is a great probability.

The Philippines were conquered and occupied by the Americans in August 1898, when a purely military government was established. In May 1899 the military authorities began the re-establishment of civil courts, and in July of the same year they began the organization of civil municipal government. To continue the work of organizing and establishing civil government the president of the United States appointed in February 1900 a Philippine Commission of five members. In July 1902 the Congress of the United States approved an act which contained a bill of rights, provided for the establishment of a popular assembly two years after the completion of a census of the Philippines, and more definitely provided for the organization of the judiciary. The first popular assembly, of 80 members, was opened at Manila on the 16th of October 1907, only nine years and 2 months after the conquest.

Since then the legislature has been composed of two branches, the upper house called the Philippine Commission, now consisting of three American and five Filipino Commissioners, and the lower house called the Philippine Assembly. All the members of the Assembly are elected by the Filipinos. The islands are subdivided into 36 provinces, besides the recently created Department of Mindanao and Sulu. Each province has a governor, who is elected by popular vote, except in the Department of Mindanao and Sulu, four other provinces inhabited largely by non-Christian tribes and the Province of Batanes; in these the governor is appointed by the Governor-General of the islands, with the advice and consent of the Philippine Commission. The municipal government of the towns is practically autonomous, the officials, consisting of a president, a vice-president and a municipal council, being all elected by the qualified voters of the municipality. The supreme court consists of 4 American and three Filipino judges. In the classified civil service of the islands the proportion of the Americans is gradually falling and that of the Filipinos rising. In 1911 sixty-seven per cent. of the Civil Servants were sons of the soil. Since then their proportion has still further increased.

Filipino Civilization.

What is the history and state of civilization of the Filipinos which has permitted of this rapid evolution of self-government?

Large numbers of these islanders are still in a state of complete barbarism, of which we shall give some idea later on, the majority perhaps, semi-civilized, and a small minority may be said to be fairly educated.

The Filipinos were not wholly illiterate before the arrival of their Spanish conquerors. The influence of the civilization of India had extended to Malaysia and modified the culture of the primitive forest-dwelling and seagoing Malays. Syllabic systems of writing were in use in the Philippines. Chirino (*Relacion de las Islas Filipinas*, 1604) states, "so given are these islanders to reading and writing that there is hardly a man, and much less a woman, that does not read and write in letters peculiar to the island of Manila." "They write upon canes or the leaves of a palm, using for a pen a point of iron." These syllabaries passed quickly out of use among the peoples Christianised by the Spanish, and no actual examples have come down to us, though the form of the syllabaries has been preserved as used by Bisaya, Tagalog, Pampango, Pangasinan, and Ilokano.....

Mohamedanism had also entered the southern islands of the archipelago and sent colonists to Manila Bay. The entrance of this faith meant a new source of civilization, with writing in the Arabic characters, and books of laws, genealogies, and devotion. The Moro peoples of Mindanao and the Sulu Archipelago still maintain teachers and *imams*, while the proportion who can write their Moro languages in Arabic character is surprisingly large—*Cyclopedia of Education*, Vol IV, p. 674.

Though the people who were converted to Christianity forgot the kind of writing for which they were indebted to India, the *Cyclopedia of Education* goes on to say:

But the dominant influence in the civilization of the islands was destined to be European and Christian. The permanent occupation by Spain began with Legazpi's expedition in 1565.

As to the civilizing effect of Spanish rule the same *Cyclopedia* tells us:

The motives which led the Spaniards to establish secondary and high schools in the Philippines were the education of their own sons and training for the priesthood.....

Up to and past the middle of the nineteenth century, education remained wholly in the hands of the Church, and while the mass of Filipinos received instruction in the parishes in doctrine and catechism, there were practically no educated Filipinos outside of the clergy. In spite of repeated decrees of the king enjoining the use and teaching of Spanish, this language had made no progress among the natives. Travellers in the islands up to 1870 are unanimous that the Filipinos able to speak the Spanish tongue were rarely met.

Three facts, then, are clear: the Filipino tribes had no indigenous civilization or

BAGOBO WARRIORS

Though not essentially a warrior tribe, the Bagobos have curious religious beliefs which incite them to certain bloodthirsty and repulsive deeds. In warfare they take not only the head of their slain enemy but the hands and heart as well. Even within recent years they have been guilty of human sacrifice and their custom was *to eat* the sacrificial victim, all of them owned slaves obtained either by purchase or capture, and it was a slave who was usually offered at the annual festival of their god DIWATA. The people generally are clean and sober, but all classes are addicted to the betel nut, which they chew with tobacco or *buvo* leaves. Those who have killed men wear spotted red and yellow costume, and the red and yellow skirt belongs only to the wife of a man killer. A Man killer of the Bukidnon tribe wears a most remarkable head ornament fashioned from cloth of gold, with elaborate scarlet, blue or white tassels. (See portrait on the reverse page).

AN IFUGAO HOUSE.

The Ifugao houses are raised from the ground by posts having projecting shoulders designed to prevent rats and other small animals from gaining entrance. Till a few years ago the Ifugao were persistent head hunters and the skulls thus obtained form, to this day, a prominent feature of house decoration ; sometimes they are used to form a frieze and at others they are enclosed in open-work baskets dependent from the eaves. Each house has two rooms, a living room and a store-room, the latter situated in the roof

literature; Hindu and Musalman influence had some civilizing influence on them, much of which was lost on their conquest and conversion by the Spaniards; and, the Spanish occupation did not do much to educate and civilize them.

As a result of the American government of the islands for twelve years, in 1911-12 five per cent. of the total population were at school. In British India 3 per cent. of the total population are under instruction.

The state of a nation's arts, industries, finance, etc., is also an index to its civilization. From ancient times India has been famous for her arts (applied and fine) and crafts; from time immemorial she has been a manufacturing and agricultural country. Such is not the case with the Philippines. As regards arts and industries, her ancient history is a blank; there are no monuments to testify to their existence. At present agriculture is the principal industry, but it is still generally in a primitive condition, implements and methods being for the most part antiquated, farm animals scarce, labour insufficient, and capital wanting for the proper development of the soil. Little has, as yet, been done towards the development of the mineral resources of the islands, except gold. The manufacturing industry consists mainly in preparing agricultural products for market, and in the production by the Filipinos of wearing apparel, furniture, household utensils, and other articles required to supply their primitive wants.

Filipinos not a Homogeneous People.

There is an Anglo-Indian and British Tory theory that a people cannot be a nation and a self-ruling one, unless it is one in race, habitat, language, religion, and degree of civilization. The Filipinos do not satisfy the requirements of this theory.

The total number of the islands enumerated within the Philippine archipelago is 3141. The archipelago cannot, therefore, be spoken of as a geographical unit in the Anglo-Indian and British Tory sense.

In 1914 the total population was estimated at 8,937,587. Of these approximately one-eighth are non-Christians and more primitive than the Christianised peoples. The dominant religion of the islands is the Roman Catholic, there being also followers of other Christian Churches of Western name and origin. An independent Filipino Church has also come into

existence. The Moros are Mohammedans. There are pagan tribes in some of the more remote regions. As they number about 800,000, they are not at all a negligible minority.

As regards race, the vast majority are of the Malayan or brown race; the remainder being of the yellow, black, white and mixed races.

Of the black race 97·8 per cent are Negritos, who are believed to be the aborigines of the Philippines. Nearly all of them live in a primitive state in the interior of Luzon, Panay, Mindanao and Negros. Their toes are so prehensile that they can use them nearly as well as their fingers. They tattoo themselves and wear very little clothing, usually only a gee-string. They have no fixed abodes but roam about in groups of a few families.

The brown race, which came from the south in successive waves of immigration beginning in prehistoric times, *is composed of twenty-three distinct tribes varying widely in culture, language and appearance*; their languages however belong to one common stock and there is a general resemblance in physical features and in quality of mind.

Seven Christian tribes form the bulk of the population.

The Moros were the last of the Malays to migrate to the islands; they came after their conversion to the Mahomedan religion, and their migration continued until the Spanish conquest. Slavery is common among them. They are generally miserably poor, cruel and haughty.

The Igorots are the chief representatives of the early Malay immigration to the Archipelago. Among the wildest of them head-hunting is still a common practice; but the majority are industrious farmers laying out their fields on artificial terraces and constructing irrigation canals with remarkable skill.

Some tribes indulge in human sacrifice and eat the flesh of the victims.

The Hon. Dean C. Worcester, Secretary of the Interior of the Philippines, 1901-1913, contributed an article on "The Non-Christian Peoples of the Philippine Islands" to *The National Geographic Magazine* for November, 1913. Our illustrations and the descriptive matter printed beneath them are taken from this article, which contains 49 illustrations in eight colours and numerous other illustrations in half-tone.

Mr. Worcester says that at the present time approximately half of the territory of the Philippine Islands is inhabited by the uncivilized non-Christian peoples, who constitute nearly an eighth of the entire population. He adds that there are probably no regions in the world where within similar areas there dwell so large a number of distinct peoples as are to be found in northern Luzon and in the interior of Mindanao. The pictures and their descriptions taken from Mr. Worcester's article will give the reader some idea of the primitive state of barbarism in which not an inconsiderable proportion of the Filipino population still live.

Presidency College Affairs.

It is not proper or possible for a monthly reviewer to write of current affairs of which the closing scene may come any day and regarding which there are or may be fresh developments everyday. So we shall not deal with any of the details of the affairs of the Presidency College, of which the outstanding events were the students' strike, Mr. Oaten's "hellenism", the general fine of Rs. 5 per head inflicted on them, the assault on Prof. Oaten, the appointment of the committee of enquiry, the expulsion of some students by the governing body and the suspension and removal from the principalship of Mr. James.

We may be allowed to indulge in a few general reflections.

Order or Discipline Nature's First Law.

The heavenly bodies are kept in their places by discipline or obedience to law. With the growth of scientific knowledge the conviction becomes firmer that everywhere there is the reign of law. Students, like others, must obey laws or rules. But this obedience should be made to proceed from a conviction and feeling in them, that it is for their good that the rules exist, it must not be merely imposed from without in an arbitrary manner. And their teachers also must observe the rules of gentlemanliness and human sympathy. He who cannot respect the budding manhood of even an infant pupil has still too much of the animal and savage in him to be worthy of the position of a teacher.

Parents, teachers, kings, are all entitled to respect and obedience, but not under all circumstances. Among the wildest

savages parents believe that they have the right even to kill their children; and in civilized communities, too, there are still found men and women whose treatment of their children is inhuman without being reformatory. Such was and in some places still is the character of the punishments inflicted by some teachers. In civilized countries kings have ceased to oppress. "The divine right" of kings to plunder and oppress their subjects has long been exploded. But "the divine right" of parents and instructors to insult and cruelly punish their children and students is still superstitiously believed in by many. We think insulting rebukes and severe corporal punishments are a remnant of savagery. Boy nature, girl nature, and the nature of youth, require considerate, sympathetic, humane, nay, respectful, treatment under all circumstances and at the hands of parents, teachers and others alike.

It should be remembered that these are times when from childhood onwards and upwards human beings exercise the critical faculty, and it is good that it should be so. In addition, therefore, to the artificial position or natural relationship of a superior, people should see that they have the claim to respect and obedience which is based upon character and conduct.

Strikes and the Mob-impulse.

Several Indian papers have reminded Anglo-Indian journalists that students' strikes, howsoever to be regretted, are not peculiar to this country or province. They happen occasionally in schools and colleges in Western countries, and other provinces of India, too. They should not be looked upon as peculiarly ominous or portentous and should be dealt with just as they are in other civilized countries. It should not be concluded from them that we are a peculiarly unworthy lot.

We are not going to say that the Presidency College incident has covered its students and staff or our people with glory. But we may be allowed to say something to counteract the excessive condemnation of our nation by Anglo-Indians and prevent the excessive self-abasement of some of our countrymen, both based on the same regrettable occurrence. This self-abasement has the peculiarity of finding expression only when a European happens to suffer; most disgrace-

ful episodes between Indian and Indian never calls it forth. In reality, a shameful deed is shameful whoever may be the sufferer. The guilt of any man of any race ought to make all of us ashamed of human nature, the shame of one being the shame of all.

It is not proper to draw conclusions regarding the character of a whole class or community from isolated incidents. In Western countries when school boys or college students mob their teachers or professors, they too, generally do it in an unsportsmanlike manner, they, too, do not give notice beforehand, do not punctiliously observe the rules of boxing, duelling or wrestling, do not count their own number and that of the person or persons to be attacked, they too lie in ambush, they too attack sometimes in front and sometimes from behind. This is not heroic, but this is mob-nature all over the world, not peculiar to Bengal. When individuals advocating unpopular causes are attacked in Western countries by mobs, and cuffed and kicked by them, is their conduct heroic? When not long before the beginning of the present war, some women, who were suffragettes, were roughly handled by a London mob of adults, when, as Reuter cabled out, their skirts were raised and a rude shock was otherwise given to their modesty in an unmentionable manner, was that heroic? When in America, a Negro man or woman is lynched by a white mob, is that heroic? Mobs, big or small, composed of students or of other persons, do behave in an unsportsmanlike or even cowardly, and sometimes in an inhuman manner, not because they belong to this country or race or that, but because they are mobs and are driven by a wild mob-impulse. And retaliation either by individuals or bands or mobs becomes more proportionate, more open, more sportsmanlike and more self-confessed as laws and the administration of laws become less discriminating for or against classes, punishments become more proportionate, and there is an increasing approximation in the political status and means of defence of the different parties.

Of Attacks Provoked and Unprovoked.

Men who attack others without being themselves in the first place insulted, in-

jured or attacked should be considered as having an excessive proportion of the brute in them. The man who, when insulted or assailed, can, like a Buddha, strongly forgive, because he is master of himself in every sense and strong enough to forgive, has our entire and unreserved homage and reverence. Whether we can exercise the right of forgiveness or not, we ought all to have the conviction that forgiveness is the privilege of the strong. We ought therefore to acquire strength. It is doubtful whether the weak are ever able really to forgive.

The other pole is occupied by him who when insulted or assailed is too unmoved by fear to think of any kind of lawful redress or personal retaliation. He is wholly pitiable. Those who dwell in civilized countries and when injured take the law into their own hands openly or secretly, are all alike law-breakers, though some may be more sportsmanlike and more indifferent to consequences than others.

When aggrieved, a normal individual living in normal times under normal conditions, if he does not feel strong enough to forgive, seeks redress at the hands of some constituted authority. If rules or laws be unequal or are not impartially administered there is a temptation under such abnormal conditions to take the law into one's own hands. It is the duty of statesmen to produce and maintain normal conditions.

Second Edition of February Number.

The February number of the MODERN REVIEW having been exhausted, a second edition is in the press. Those subscribers who have not yet received it, will receive their copies in the course of a week.

To Students of Prof. J. C. Bose.

On account of its importance we print here a notice which we have received from Dr. B. L. Chaudhuri, D. Sc. (Edin). We hope all students of Prof. Bose, young and old will promptly comply with Dr. Chaudhuri's request.

TO PAST STUDENTS OF PROF. J. C. BOSE.

At the close of Dr. J. C. Bose's 31 years of professorship in the Presidency College it has been thought desirable that his past and present students should combine to take steps to commemorate his past services.

and perpetuate his life-long work. The undersigned will, therefore, feel highly grateful if his past students would kindly send their names with addresses to 120 Lower Circular Road, Calcutta.

B. L. Chaudhuri,
Jt. Secy., Provisional Committee,
120 Lower Circular Road.

"The Express" Souvenir number.

To commemorate His Excellency the Viceroy's last visit to Bankipore, the *Express* has published an interesting souvenir number. It contains several valuable historical and other articles, and a number of illustrations. Beharis and Bengalis have co-operated to produce it. May that be an augury and a happy augury for the future of Behar.

The Famine in Bankura.

It has been officially stated in the *Calcutta Gazette* that owing to the absence of timely rain, the winter harvest in Bankura will be poor. The hope of a temporary and slight relief which might have been received by the people from a satisfactory outturn of cold weather crops, has therefore vanished. We learn, both from the *Bankura Darpan*, the vernacular organ of the district, and from relief-workers in the field that the condition of the people is daily growing worse. The number of seekers of relief are fast increasing, and more relief centres have also been opened. The doles of rice have also been increased in quantity. It is now estimated that relief will have to be given till at least the end of September next.

There is a threefold scarcity; scarcity of food for men, scarcity of food for cattle, and scarcity of water for both men and cattle. If money be forthcoming, enough rice can be had in the local markets. Fodder may also be had, but not perhaps in sufficient quantities. It requires to be imported from other districts. As for water, there is nothing for it but to dig new tanks and wells and repair old ones. This will also provide remunerative work for able-bodied men and women of the labouring class; but, for this, large sums of money are required.

Forty tanks are now being excavated; but a far larger number is required. Men and women are also at work on new and old roads.

Unwholesome and insufficient food and impure water have produced cholera and other diseases in several places. Large number of persons who had left home in search of work, have now come back, some disappointed and others ill of malaria or Kalazar.

The Bankura Sammilani Relief Committee, of which the editor of this Review is vice-president and treasurer, spends at present about Rs. 300 a week. In the course of a week or two, a much larger amount will be needed every week. It is also in contemplation to try to do something in a few centres to supply good drinking water. Friends are therefore requested to kindly continue the help which they have been generously giving. Contributions received are thankfully acknowledged elsewhere in this issue.

Free meals for School Children.

Free meals are given to children in elementary schools in most civilized countries. Compulsory and free universal education makes it necessary that children should have such meals, as many parents are too poor and some too negligent to feed their children properly. To tax the brain without properly nourishing the body is like burning the candle at both ends.

Last year we were glad to read in the papers that the State of Travancore had, with the help of some villagers, begun to supply free meals at noon to the pupils of some schools. The practice has been adopted at Baroda too. A committee appointed by His Highness the Gaekwar of Baroda to inquire into and suggest changes, if necessary, in the system of education prevalent in Baroda pointed out the marked physical degeneration that was setting in among the rising generation and suggested that a probable cause was that school children had to go without food for many long hours. The result was the experiment of supplying free meals during the midday recess. The experiment has been quite successful. There has been an average gain in the weight of the students, and there is better discipline and more alertness in learning.

The Hindu University.

The foundation of the Hindu University is a great event. This institution is not meant simply to feed Hindu young men and women on western or eastern knowledge merely, though knowledge from no quarters will be neglected. The university is meant to conserve the best in Hindu culture and civilization, and to enable the Hindu mind to realise and express itself in literature, science and art, and give to the world by this means what it is capable of creating and giving.

Opinions will differ as to what is Hindu and what not. There will be greater differences still as to what is the best and most essential element in Hindu culture and civilization. It is therefore good that no definition of Hindu has been given in the university act. Whatever is most vital will no doubt survive.

Hindus of all classes and ranks, holding various shades of religious and social opinion, and others, too, assembled in Benares on the occasion of the laying of the foundation stone by the Viceroy. The bejewelled and bedecked rulers of states were there. Commoners whose claim to distinction rests on intellectual achievement were also there. All must have reflected what makes for power in these days and may be expected to act accordingly.

Executive and Police arrangements.

The executive and police arrangements made on the occasion have annoyed a good many persons, including students, mostly Bengali. This should not make anybody dissatisfied with the University authorities, as the aforementioned arrangements were beyond their control. Nor should any innocent man feel insulted or aggrieved by what certain public servants do. For it is only those who betray signs of life that receive their attentions, which are, therefore, a kind of indirect compliment.

An Indian Body for the Hindu University.

As suggested in the *Central Hindu College Magazine*, by Mr. O. C. Ganguly, the Hindu University buildings should be of some Indian style of architecture. An Indian body should enclose an Indian spirit.

Hindu University Addresses.

Many striking addresses were delivered on the occasion. Prof. J. C. Bose in his

masterly address went to the root of the matter and pointed out in an inspiring manner what should be done to make the Hindu university worthy of its name. He deprecated a repetition of the Universities of the West. He said:—

In tracing the characteristic phenomenon of life from simple beginnings in that vast region which may be called unvoiced, as exemplified in the world of plants, to its highest expression in the animal kingdom, one is repeatedly struck by the one dominant fact that in order to maintain an organism at the height of its efficiency something more than a mechanical perfection of its structure is necessary. Every living organism, in order to maintain its life and growth, must be in free communion with all the forces of the universe about it.

Stimulus within and without

Further, it must not only constantly receive stimulus from without, but must also give out something from within, and the healthy life of the organism will depend on these two-fold activities of inflow and outflow. When there is any interference with these activities, then morbid symptoms appear, which ultimately must end in disaster and death. This is equally true of the intellectual life of a Nation. When through narrow conceit a Nation regards itself self-sufficient and cuts itself from the stimulus of the outside world, then intellectual decay must inevitably follow.

Special Function of A Nation

So far as regards the receptive function. Then there is another function in the intellectual life of a Nation, that of spontaneous outflow, that giving out of its life by which the world is enriched. When the Nation has lost this power, when it merely receives, but cannot give out, then its healthy life is over, and it sinks into a degenerate existence which is purely parasitic.

How India can Teach

How can our Nation give out of the fulness of the life that is in it, and how can a new Indian University help in the realisation of this object? It is clear that its power of directing and inspiring will depend on its world status. This can be secured to it by no artificial means, nor by any strength in the past; and what is the weakness that has been paralysing her activities for the accomplishment of any great scientific work? There must be two different elements, and these must be evenly balanced. Any excess of either will injure it.

How to Secure This Status

This world status can only be won by the intrinsic value of the great contributions to be made by its own Indian scholars for the advancement of the world's knowledge. To be organic and vital our new University must stand primarily for self-expression, and for winning for India a place she has lost. Knowledge is never the exclusive possession of any particular race, nor does it recognise geographical limitations. The whole world is interdependent, and a constant stream of thought had been carried out throughout the ages enriching the common heritage of mankind. Although science was neither of the East nor of the West but international, certain aspects of it gained richness by reason of their place of origin.

Professor Bose thought:

In any case if India had to make any contribution to the world it should be as great as the hope they cherished for her. Let them not talk of the glories of the past till they have secured for her her true place among the intellectual nations of the world. Let them find out how she had fallen from her high estate and ruthlessly put an end to all that self-satisfied and little minded vanity which had been the cause of their fatal weakness. What was it that stood in her way? Was her mind paralysed by weak superstitious fears? That was not so; for her great thinkers, the Rishis, always stood for freedom of intellect, and while Galileo was imprisoned and Bruno burnt for their opinions, they boldly declared that even the Vedas were to be rejected if they did not conform to truth. They urged in favour of persistent efforts for the discovery of physical causes yet unknown, since to them nothing was extra-physical but merely mysterious because of a hitherto unascertained cause. Were they afraid that the march of knowledge was dangerous to true faith? Not so. For them knowledge and religion were one.

He concluded with a note of undying hope.

"These are the hopes that animate us. For there is something in the Hindu culture which is possessed of extraordinary latent strength by which it has resisted the ravages of time and the destructive changes which have swept over the earth. And indeed a capacity to endure through infinite transformations must be innate in that mighty civilisation which has seen the intellectual culture of the Nile Valley, of Assyria and of Babylon wax and wane and disappear and which to-day gazes on the future with the same invincible faith with which it met the past."

It is remarkable that an orthodox Sanskrit scholar like Pandit Srikrishna Joshi of Allahabad also dwelt on the freedom of thought of the ancient Hindus on which Prof. Bose laid stress. In his paper on Indian culture and its claims which the Pandit read in Benares occurs the following passage:

No other religion can claim to allow liberty of conscience and freedom of thought and speech to the extent enjoyed by the followers of the Vedic religion. Europe has known martyrs of free thought from the time of Socrates down to the days of the Inquisition. In India even downright atheists like the Charvakas were allowed to disseminate their views unmolested. Kapila never suffered any persecution for declaring that the existence of God could not be proved. On the contrary, he has been given the unique distinction of being included among the seven fathers of Sankya philosophy called *Sanakadi Sapta manushyah*, who are offered libations known as *tarpana* by all who offer them to their ancestors. This honour is not paid to the founder of any of the most orthodox systems of philosophy or to any one else, except Bhishma, the renowned hero of the *Mahabharat*, who is so honoured for his surpassing wisdom, virtue and valour. Gautama Buddha, who broke away from the Vedic religion, and made converts of the followers of that religion, was never persecuted. On the other hand his renunciation of a kingdom, his

lofty character and his humane teachings were rewarded by his deification as an *avatar* of Vishnu. His followers were allowed to live in peace among the followers of the Vedic religion.

Another point in favour of the Vedic religion is that it does not come in conflict with science.

The Pandit's paper was a reasoned and impassioned plea for the study of Sanskrit literature.

Similar was the object of the scholarly and informing paper on "The Educative Influence of Sanskrit" read by Mahamahopadhyay Pandit Haraprasad Sastri. He dwelt on its wonderful continuity and magnificent volume, and said that Sanskrit literature contains the religious literature not only of the Hindus, but also of the Buddhists and Jainas, not to speak of other religions which have perished after doing their mission of good in India.

But we are not here to speak only of religious influence, because that is very well-known and need not be expatiated upon. Therefore, I will confine myself to the beneficial secular influence, which Sanskrit may exert on its votaries; and for that purpose I shall have to enumerate the vast number of branches into which that secular literature divides itself.

He spoke particularly of Economics, the various experimental and other Sciences, the Mechanical Arts, Arts, History and kindred subjects, Philosophy, Poetry and the Drama, and many miscellaneous branches.

A literature to be effective and complete, must reflect the entire life and action of a race. If there is any truth in this maxim, that truth has been completely realized in Sanskrit literature. Never, in the ancient world and even in the mediæval world, before the manufacture of paper, and the invention of printing, was a literature so thoroughly representative of the race as the Sanskrit literature in India. Even the art of thieving has a literature. It has two different traditions or successions of teachers, one given by Bhasa in his *Avimaraka* and another though different but more lengthy, by Sudraka in his *Mricchakatika*. When we read of them, we thought that it was a mere fancy. Would anyone care to put the art of stealing into writing? We were, however, agreeably surprised when an actual work on *Chaurasastra* was discovered. It was a thief's pocket-book on palm leaf, six inches long and about an inch and a half broad,—giving many secret chemical preparations, many incantations and many hints to avoid difficulties. Another curiosity is a work on the art of hawking which gives the life-history of the various kinds of hawks, the method of taming them and using them in sport. There are works on the game of chess and many other indoor and outdoor games, but I will not take up the time of the audience by an enumeration of these curiosities in literature,—they are not fit for occasions like this.

Prof. P. C. Ray spoke of the past glorious traditions of Benares in connection

with the sciences of medicine, surgery, chemistry and astronomy, and reminded his audience how

Alberuni, the cultured Muhammadan traveller of the 11th century, quoted the famous passage of Varahamihira which, interpreted, means, "the Greeks are 'unclean,' but the science of astronomy is their *forte*; we have to learn at their feet, and these teachers are to be adored like our own Rishis."

His peroration was an exhortation to his countrymen to give up patriotic bias and imbibe the catholic spirit of Varahamihira.

What Herbert Spencer calls the "bias of patriotism" has often been the means of leading people astray into dark paths and false moves. We must look about. The whole of Asia is astir and instinct with new aspirations, and pulsating with new life. It will not do for us tenaciously to hug the past and live like the proverbial frog in the well. We should invoke the liberal and catholic spirit of Varahamihira and learn at the feet of western teachers.

Every devout Hindu pilgrim to Benares makes it a point to drink of the "Jnana Vapi" or "Well of Knowledge." I trust the new University will be a veritable "Jnana Vapi" to the students who will flock here from the distant parts of India. To me it has been a source of sincere gratification that ample provision has been made for teaching the different branches of science and of furthering the promotion of original research. I hope, the starting of this University will inaugurate a new era and I trust it will be a sacred confluence of ideals of the East and the West and will play a prominent part in the building of the India of the future.

This is my brief and humble message.

Speaking on Agriculture in Modern Universities Dr. Harold Mann pleaded for the inclusion of practical sciences like agriculture in the University courses of study.

Nearly all modern universities, at any rate in the newer countries, and very largely in the old ones also, have realized the necessity of connecting up the best intellect and the noblest minds of a country with agriculture. Even conservative institutions like Oxford and Cambridge, steeped as they are in mediæval traditions, have created special agricultural sections. They do not, as yet, give these sections the full recognition which the older recognised branches of study enjoy, but they have been admitted to the republic of letters, and will win their way, I have no doubt, to an equal seat in the circle. Other universities, not bound by the ties of the past, have done more. In England, still more in Scotland, in the Britain beyond the seas, in the United States, already fullest recognition is given, and all I plead for in the present address is already given.

In India here we are conservatives among the conservatives. We modelled most of our universities in the middle of the nineteenth century when the older spirit was dominant. In Bombay, slowly and with very great hesitation, the recognition of agricultural studies, as being possibly a form of liberal culture, has been granted. Even there, however, the recognition has been grudging and is still incomplete. Elsewhere there has been nothing.

But as we stand today at the opening of a new university I feel we may be at the dawn of a new era where all that men can do is seen to be worthy of study and when the intellect will not merely aspire to soar in the clouds but will feel also that it can be as usefully and as nobly employed in studying the life and the occupation of the meanest of the population of the country. Trust me, this is a worthy outlook. Accepted, and the new university puts behind it the darkness of the older period of esoteric learning, and even the half lights of the waking days of the wider culture of more recent times,—and leads us, in India at any rate, into a nobler day when intellect shall be proud to serve mankind.

Mr. H. Sharp, Education Commissioner with the Government of India, the maker of the wise observation that an agricultural population does not require much education, will please make a note of the above passage.

Lieutenant-colonel K. R. Kirtikar, I.M.S. (retired), said in the course of his address :—

Professional efficiency of Indian Medical practitioners being admitted on all hands, it is desirable to ameliorate their condition and improve their status. They have proved bold operators, for many Indian medical men have performed difficult surgical operations with great success; skilled physicians, subtle chemical analysers and perfect accoucheurs. What then, stands in the way to place them in higher or more responsible posts? Give them an opportunity to display the forces which lie latent and hidden in them at present. What inducement have they to work, when all avenues of distinction are more or less shut against them? The present system in vogue, the system which denies the alumni of Indian Medical Colleges the higher appointments—is not the one to foster a spirit of original research, in the domain of medicine or science among the medical graduates of the Indian Universities. This policy of exclusion has thrown a damper upon Indian medical talent.

There were many other notable addresses delivered, but the limits of space, it is to be regretted, prevent us from noticing or mentioning them.

Russia and Japan.

Just now Japan is evincing a great fondness for Russia, her erstwhile enemy. We all know that Japan is supplying Russia ammunitions; she has even sent Japanese artillerymen to teach her friend to shoot effectively. She has raised a loan for Russia and now we learn, on reading a few issues of the *Kobe Herald*, of the magnificent reception accorded to Grand Duke George Michailovitch, the Czar's representative. We learn from the same paper that the Japanese Emperor went to the railway station of Tokio in person, to welcome the Grand Duke, a thing which could never have been credible in the days of the departed Emperor Mutsuhito. The *Kobe Herald*,

further informs us that Russian coins are going to be struck at Osaka.

Gold and silver bullion, representing a value of £20,000,000 arrived at Osaka from Tsuruga on Saturday evening. Six gendarmes and several detectives were in the train which carried the bullion. Immediately after arrival, this bullion, was transported to the Osaka Mint. It is reported that with this bullion, Russian coins representing a value of 15,000,000 roubles will be made at the Mint. Two officials of the Russian Mint have arrived in this country with the necessary dies and matrices.

Russian ambitions of territorial expansion in Asia and especially in China are well-known. Japan, too, holds similar ambitions; and that, in fact, was accountable for the Russo-Japanese War. These ambitions will not be any the whit less on the part of both countries after the conclusion of the present war. It would be to the mutual advantage of both countries if they could work out their ambitions, side by side, as friends and not as rivals. Hence the eagerness of Japan to cultivate the friendship of Russia. Russia and Japan combined would be able to place in the field the most numerous land-army in Asia. And, if China's resources in men could be secured, by treaty or force, the aggregate would be unrivalled, in our old continent at any rate. England can, no doubt, utilize the military resources of India; but it would take time for her to repose confidence in the people of India and follow a steady policy.

The Monarchical movement in China : What Japan thinks of it.

We are indebted to the *Kobe Herald* for the following interesting Japanese views regarding the efforts of Yuan-Shih-kai to establish a monarchy in China and himself as the Emperor.

The *Asahi* asks who has led China to the present state—a state in which it is neither an Empire nor a Republic—and who has thrown the people into a state of uneasiness? The present condition of things is the outcome of the highhanded action of the Yuan-Shih-kai Government in pushing forward the movement for a Monarchy! The Yuan Government still refuses to realise its failure and will not compose the public mind by stopping the movement for a Monarchy. Further, the Peking authorities assured the Powers that the Monarchy would not be adopted in a hurry. Now disturbances have already broken out, and it is doubtful whether the Chinese Government can subdue them. It may be pointed out, says the *Osaka* journal, that there are signs that some of the expeditionary troops will join the Rebels. The Peking Government has now prohibited foreigners from travelling in the provinces of South China, and has asked the foreign missionaries to leave Szechuan. It still intends to establish a Monarchy and to carry

out the plan without delay. It is hardly necessary to repeat that Japan, in co-operation with four other Powers, had addressed a warning to China, fearing the outbreak of a disturbance. The Yuan-Shih-kai Government has entirely disregarded the good will and friendship of the Powers and trampled upon their views. However, proceeds the *Asahi*, the adoption of such an insolent attitude by the Yuan-Shih-kai Government is due to the weak and yielding policy pursued by the Japanese Authorities.

The *Osaka Mainichi* says :

The Chinese Authorities seem to intend to hold the Coronation as soon as possible on the pretext that even a day's unnecessary delay is calculated to unsettle the public mind. In reality, however, this is quite false reasoning, as a day's delay should serve to compose the public mind one day longer. The Japanese Government addressed a warning to China, because it had discovered this fact. In reply to the warning, China stated that there was no fear of the outbreak of disturbances and that even if a disturbance should break out, the Government was able to subdue it. While China's tongue was still wet, Yunnan and Kweichow declared independence and Kwangtung, Kwangsi and Szechuan seem likely to follow their example. Moreover, there are indications of unrest in Hunan. And the Yuan Government is powerless to subdue the revolted provinces. Surely China must feel ashamed to meet the Quintuple Powers, especially Japan. Mr. Yuan-Shih-kai cannot ascend the throne, in view of the actual situation. In the event of Yuan-Shih-kai daring to ascend the throne, without regard to the Quintuple Powers and especially Japan, thereby fanning the flames of disturbance, Japan should interfere in China. So long as the present situation continues, Yuan-Shih-kai cannot ascend the throne, and China, cannot announce the alteration of her national constitution abroad.

Yuan seems to be very anxious to get the proposed monarchy in China recognised by Japan. To attain this end he is said to be even ready to bribe Japan. For we read in the *Kobe Herald* :

A message from Shanghai to the *Osaka Mainichi* reports that according to a Chinese newspaper, China has presented the following conditions in return for the recognition of the Monarchy :—

1.—That China will recognise Japanese jurisdiction in Kirin and Mukden Provinces and cede the Ching-Pu Railway and the coast line between Pe uan and Shantung.

2.—That China will engage Japanese as financial advisers and entrust the training of troops to Japanese officers.

3.—That China will agree to co-operate with Japan in establishing and carrying on Arsenals.

A leader of the Chinese Revolutionists in Tokio is quoted by the *Mainichi* as saying that the mission of Mr. Chou, China's Envoy, is said to be to obtain Japan's recognition of the adoption of a Monarchy by offering the Han Wei-ping mine and two railways, but it is doubtful whether the Japanese Government will accept the offer. He said he hoped that Japan would not be misled by the prospect of minor advantages, losing sight of the greater interests of the two countries.

All that has hitherto appeared in the

papers makes Yuan-Shih-kai responsible for the movement for a monarchy. But in diplomacy very often it is found that "things are not what they seem." Some six months ago information was available in our country that Japan would press Yuan-Shih-kai to ascend the Chinese throne as emperor, promising that if trouble arose in consequence she would help him to quell the disturbances; but if Yuan did not listen to the advice of Japan she would help the revolutionary party of Sun Yat Sen. Whether this information was derived in the last resort from trustworthy sources or not cannot be ascertained; but the actual event, the movement for monarchy, has, as anticipated, taken place; though it is beyond our power to discover whether Japan was at the bottom of it or not. The British Government have undoubtedly better sources of information;—at least, ought to have. For Japanese ascendancy in China is not without its bearing on Indo-Britannic politics and policy, and whatever is calculated to give Japan opportunity to interpose in Chinese affairs requires close watching.

Progressive Travancore.

To the patriotic Indian, the recent address of the Dewan of Travancore to the Sri Mulam Popular Assembly is a hope-inspiring document. It gives us very welcome information regarding the progress of that State in various directions. Take education, for example.

Including unrecognised schools, the total number of educational institutions in the State during 1090 was 3,243 and their strength 3,96,753. The percentage of pupils in all denominations of schools to the total population was 8.9 and to the number of children of school-going age 50.6. There was on an average one recognised school for every 3.5 square miles of the area and for every 1,684 persons of the population of the State. 73.2 per cent of the boys and 29 per cent. of the girls of school-going age were under instruction in recognised schools. Devicolum is the only taluk with less than 30 per cent of its children of school-going age attending school, while Tiruvalla, which takes the second rank among the taluks of the State in point of population, shows the greatest progress, with 99.8 per cent of its children of school-going age attending recognised schools. In this connection, it will be of interest to you to know that the last Administration Report of Baroda states that "Travancore deservedly represents the highest watermark yet obtained in India by the voluntary principle in education."

This is a much better record than any that any British Indian province can show. Take Abkari.

In connection with reduction of country-liquor shops, the following figures will be interesting :—

Year.	Number of Shops.
1083	7,050
1084	5,103
1086	4,634
1088	2,462
1090	2,273

It will be seen that, in the course of seven years, the number of these shops in the State has been reduced by 68 per cent.

Can any province or district in British India show such a record?

An All-India Music Conference.

The wonderful musical talents of Moula Bux found recognition and encouragement in Baroda. The Gackwars have been munificent patrons of music. It was in the fitness of things therefore that a meeting was held at Baroda on the 10th January last to consider the question of an All-India Music Conference at which it was resolved that the Conference should be held on such dates during the second week of March, as may be convenient to His Highness the Maharaja Sahib. His Excellency the Dewan Sahib on behalf of the State was pleased to indicate that the travelling and entertainment expenses of the guests, which were estimated at about Rs. 5,000, would be met by the Government of His Highness. This was only to be expected.

History of Aurangzib.

The third volume of Professor Jadunath Sarkar's original history of the reign of Aurangzib is in the press and will be out in April next. It covers the twenty-four years forming the first half of the reign (1658-1681) which the Emperor passed in North-east India, and deals with an immense variety of subjects and interests. Three chapters of it were published in this *Review* in 1915. The Mughal conquests of Assam and Chittagong, the Rajput Wars that followed the death of Jaswant Singh, the relations of India with the outer Muslim world and the Frontier Afghans in the 17th century, Aurangzib's repression of the Hindus and demolition of temples, and the risings of the Jats, Satnamis and Sikhs are fully dealt with in the volume and much curious and new information given.

Price of Milk in England.

When I was in England, more than two decades ago, I found milk was much cheap-

er in London than it was in Bombay or Calcutta. I was unable to find an explanation. But not long ago, reading a book on Agricultural Economics, I came across the following passage which gave the true explanation of the fact, which had greatly puzzled me for many a long year. The author writes :—

"Since the fall in the price of cereals, about thirty years ago, the European field-system has been quite upset. Those articles which will not stand long shipment, such as milk, vegetables, etc., prove most profitable because foreign countries cannot compete so successfully upon the European markets. As a result gram land has, in many instances, been converted into pastures. A good example of this is found in eastern England where many old wheat fields have been converted into permanent pastures for dairy cows. The production of green fodders for cattle has proved relatively more profitable in recent years than formerly." (An Introduction to the Study of Agricultural Economics, by H. C. Taylor, p. 75). B.

Sven Hedin in Simla.

"How fascinating is this sight, but how much more imposing as a symbol of the power of the British Empire! Here the eagle has its eyry, and from its point of vantage casts its keen eyes over the plains of India. Here converge innumerable telegraph wires from all the corners and extremities of the British Empire, and from this centre numerous orders and instructions are daily despatched "On His Majesty's Service Only"; here the administration is carried on and the army controlled....."

—*Trans-Himalaya, Vol. I. Chap. I.*

Sven Hedin on the Tashi Lama.

The Tashi Lama, the head of the monastery at Tasi-lunpo, whose temple roofs glitter with gold and where 3800 monks dwell, is the spiritual lord of Tibetan Lamaism, as the Dalai Lama is its political pontiff. He is elected by a college of cardinals partly by nomination and partly by lottery, and is regarded as the incarnation of the Amitabha. We should add that the celebrated explorer Sven Hedin does not suffer from an excess of humanity or of regard for the feelings and the civilisation of oriental nations, and might, from remarks made everywhere in his books, be easily mistaken for hidebound Anglo-Indian bureaucrat.

"Wonderful, never-to-be-forgotten Tashi Lama! Never has any man made so deep and ineffaceable an impression on me. Not as a divinity in human form, but as a man, who in goodness of heart, innocence, and purity approaches as near as possible to perfection. I shall never forget his expression: it displayed unbound kindness, humility, and philanthropy; and I have never seen such a smile, a mouth so delicately formed, so noble a countenance. His smile never left him: he smiled like a sleeper dreaming of something beautiful and desirable, and whenever our eyes met,

his smile grew broader, and he nodded kindly and amiably, as much as to say: "Trust in my friendship implicitly, for my intentions are good towards all men."

"The incarnation of Amitabha! The earthly shell in which the soul of Amitabha lives on through time! Therefore a deity full of supernatural wisdom and omniscience. The Tibetans believe that he knows not only what is and has been, but also all that is to come. Can he be Amitabha himself? This much is certain, that he is a very extraordinary man, a singular, unique, and incomparable man. I told him that I thought myself fortunate to have seen him, and that I should never forget the hours I had spent in his company.....For my part I could hardly think of anything else but the Tashi Lama and the powerful impression he had made on me. I left the Labrang, his cloister palace, intoxicated and bewitched by his personality. This one day was worth many days in Tibet, and I felt that I had now beheld what was most remarkable in the country....." *Trans-Himalaya, Vol. I. Chap. XXV.*

Again Sven Hedin writes, after more than a month's acquaintance and intimate association,

"...he was one of those rare, refined, and noble personalities who make other people feel that their lives are fuller and more precious. Yes, the memory of the Tashi Lama will cleave to me as long as I live. His friendship is sincere, his shield is spotless and bright, he seeks for the truth honestly and humbly, and knows that by a virtuous and conscientious life he renders himself a worthy temple for the soul of the mighty Amitabha." *Trans-Himalaya, Vol. I. chap. XXVIII.*

The Tibetan Prayer Wheel.

"In one particularly small room stand two colossal cylindrical prayer-mills before which a crowd is always collected—monks, pilgrims, merchants, workmen, tramps, and beggars. Such a praying machine contains miles of thin paper strips with prayers printed on them, and wound round and round the axis of the cylinder. There is a handle attached, by which the axle can be turned. A single revolution, and millions of prayers ascend together to the ears of the gods."—*Trans-Himalaya, Vol. I, chap. XXVIII.*

Spiritual Slavery of the Lamas.

"The people are kept by the Lamas in spiritual slavery, and the lamas themselves are docile slaves to the tomes of narrow-minded dogmas which have been stereotyped for centuries, which may not be interfered with or criticised, for they are canonical, proclaim the absolute truth, and stand in the way of all free and independent thought. The clergy form a very considerable percentage of the scanty population of this poor country. Without the Peter's pence Tibet could not make both ends meet. Tashi-lunpo is, then, a huge savings box, in which the rich man places his pile of gold, the poor man his mite. And with what object? to propitiate the monks, for they are the mediators between the Gods and the people. Scarcely any other land is so completely under the thumb of the priests as Tibet."—*Trans-Himalaya, Vol. I, chap. XXX.*

The Civilisation of the Tibetans.

And yet, poor as the people may be, the glimpses that we get of life in Tibet from

the author's book show that the people are not so badly off after all as may be imagined. The solid white houses of stone, the vast and imposing monasteries many stories high and with massive towers and golden roofs, the terraced gardens, the solemn religious processions and soul-stirring hymns, the brilliant New Year's festival, where the dignified movements of the monks, amidst the vast concourse of people impressed Dr. Sven Hedin who writes: "their gestures are noble; when they converse, bending slowly towards one another, an air of genuine, striking nobility pervades the whole picture without the slightest touch of anything vulgar," their horse races and shooting competitions and other manly amusements, their religious disputations and solemn convocations for the conferring of degrees—each monk must take a vow of chastity and abstinence and study the Kanjur and other sacred books for a number of years—all these betoken a state of civilisation which, both in its material and spiritual aspects, is not altogether despicable. Dr. Sven Hedin himself says at one place:

"It is astonishing to find in Tibet so much cultivable land, and such a number of inhabited villages with solid stone houses and gardens."

We read of 'pictured galleries', 'towns of white sanctuaries,' 'numerous pictures of the Buddha painted in fresco on the walls,' 'suits of armour with shirts of mail, iron rings, maces, spears, tridents, and lances', 'pillared halls, statues of monks and images of Buddha, handsome banners on Chinese silk, 'extremely finely executed frescoes which cover the walls' of monasteries, and again and again, of the "grand, lovable, divine Tashi Lama."

The Monasteries of Tibet.

"The whole broad valley at Ye is begirt by a circle of monasteries" [and, as the context shows, of nunneries also]. There is the "wonderful monastery of Tashi-gembe, which, after Tashi-lunpo, is the richest and finest I have seen in Tibet. As to cleanliness and good taste, it surpasses all." "The Monastery of Lingayompa is placed on the uppermost ledge of a steep flight of terraces, and is as fantastic, fascinating and attractive as a fairy castle." Of the sanctuary of Tarting-gompa ['Gompa' is a monastic cave, cf. the 'Hasti-Gompa' or Elephant Cave at Udaygiri in Orissa] Sven Hedin writes:

"I started with surprise in the portal, for we had seen many halls of the gods in Tashi-lunpo, but never yet one so large, ancient, and so wonderfully fascinating in its mysterious light.

"What rich and subdued coloring! The Sego-Chummo-thakang, as it is called, is like a crypt, a fairy grotto, recalling to mind the rock temples of Elephanta, but here all is of repainted wood, and 48 pillars support the roof. The capitals are green and gold, carved in intricate and tasteful designs, and carved lions, arabesques, and tendrils adorn the projecting beams of the ceiling. The floor consists of stone flags, their cracks filled up with the dust of centuries, so that it is smooth and even as asphalt. The daylight falls into the hall through a square impluvium, spanned by a network of chains. . ."—Vol I, chap XXXII.

The Cavedwelling Monks.

The lifelong immurement of some monks in cave dwellings in entire seclusion from day-light and the world and human association, leads Sven Hedin to indulge in the following reflections:

".....his tremendous fortitude, compared with which everything I can conceive, even dangers infallibly leading to death, seems to me insignificant. For, as far as I can judge, less fortitude is required when a hero, like Hirose, blockades the entrance of Port Arthur, knowing that the batteries above will annihilate him, than to allow oneself to be buried alive in the darkness for forty or sixty years. In the former case the suffering is short, the glory eternal; in the latter the victim is as unknown after death as in his lifetime, and the torture is endless, and can only be borne by a patience of which we can have no conception..... Waddell, who has a thorough knowledge of Lamaism, believes that the custom of seclusion for life is only an imitation of the practice of pure Indian Buddhism, which enjoins periodical retreats from the world for the purpose of self-examination and of acquiring greater clearness in abstruse questions. In his opinion the Tibetans have made an end of the means."—Vol II., Chap. XXXV.

"Such a life seems hopelessly sad and gloomy. And yet a man who will venture to shut himself day and night within the walls of a dim convent must possess faith, conviction, and patience, for it is a prison which he in the tumult of his mind has chosen of his own free will. He has renounced the world when he allows himself to be walled in alive in the dark courts of Tarting; and when the smoke of his pyre ascends, it must, if equal justice be meted out to all, be a pleasant savour before the eternal throne. Vol I., Chap. XXXII.

Indian Explorers.

Important geographical explorations and discoveries in Central Tibet were made by Indian Pandits, of whose exploits passing mention is to be found everywhere in Sven Hedin's book, of one of them specially, Nain Singh by name, who discovered the great lakes in Central Tibet in 1874, Sven Hedin speaks in rapturous terms. He is 'the immortal

Pundit,' 'the incomparable and wonderful Nain Sing.' Colonel Sir Henry Trotter has described the famous journey from Leh to Lassa performed by Nain Sing in 1873.

"The great Pundit A. K., or Krishna, who contends with Nain Sing for the foremost place, crossed the most easterly parts of the Trans-Himalaya on his journey in 1881." "A pundit also went between Manasarowar and Tok-jabung—past the [lake of] Ruldap-tso. . . . It seems likely that he crossed the Trans-Himalaya by a pass called Sar-bung."

Dr. Sven Hedin concludes that two Frenchmen, two Englishmen and half a dozen Pandits had crossed the trans-Himalayan range of mountains before him, but he claims that not only had he crossed eight passes while none of the others had crossed more than seven, but seven out of the eight passes crossed by him were unknown before. Sven Hedin does not mention Babu Sarat Chandra Das, whose geographical expeditions into Tibet are so well-known.

Maharashtra Women's University.

The Maharashtra Women's University inaugurated by Prof. Karve deserves success, as it cannot but be productive of great good. Similar schemes, with changes made according to local conditions, ought to be elaborated for all the other provinces of India and carried out with steady zeal. The scheme of university extension lectures in the vernacular advocated by Dr. Nil Ratan Sircar in his presidential address at the last Theistic Conference is based on a similar idea. The Committee appointed by the Bengal Government for suggesting methods, means, and courses for the education of Hindu girls and women in Bengal, finished their labors towards the close of last year. They are of opinion that Bengali should be the medium of instruction at all stages, English being taught only as a second language. The highest courses of study outlined by them are equivalent to the B. A. courses of Indian Universities. Their scheme of a model school includes (1) a general department, (2) a technical department, and (3) a training department. Great

stress is laid on the teaching of domestic science.

Exhibition of Indian Paintings in Madras.

Art is one of the important elements by which the civilization of a country is known. Utterly neglected by our educated men at first, Art is gradually obtaining their recognition. The works of Bengali painters have been exhibited in Calcutta, Paris, London, and Lahore. They are now on exhibition in Madras. Everywhere they have received both praise and adverse criticism. Both are welcome. At Madras they are calling forth both. In the course of an address on "Modern Indian Painters and their message to young India" Mr. J. H. Cousins said:—

The first quality of the modern Indian painters to which he would call their attention was their *Indian-ness*. He knew that some good judges had seen Europe and Japan reflected in the exhibition, but this was a matter of technique. He, the speaker, with a fresh eye for Indian life and scenery, and a long and loving study of Indian thought, was not bothered by the experiments that every artist would make: he found the paintings to be full of India, and that was as it should be. India had risen far beyond the stage of the "sedulous ape." The Indian artists only found themselves when they gave up imitating poor Western copies. India could also be herself by clinging to her own ideal of spiritual realisation, and by seeing, as the modern painters saw, one life in multitudinous forms.

Mr. W. S. Hadaway, Superintendent of the Madras School of Arts is very critical in *New India*. But he admits that

"The best work in painting and drawing which India has produced in modern times is undoubtedly the work of this group of Bengali artists."

Mr. Johan van Manen also contributes a critical article to *The Commonweal* which concludes:—

The joyous message proclaimed by these pictures tells us that there exists around us, at the present day in India, a group of artists, dissatisfied on the one hand with dead national traditions, on the other hand with mere mechanical copying of unassimilated foreign models, a group which is striving and groping for new formulae for the expression of beauty and truth in pictorial form and whose productions—quite apart from the question as to what has been reached and what has not been reached as yet—shows that healthy and continuous ferment which is the token of life and the promise of growth. Not yet a school itself, this group may prepare the arising of a school of modern Indian pictorial art.

MY REMINISCENCES

BY RABINDRANATH TAGORE.

[ALL RIGHTS RESERVED. COPYRIGHTED IN THE UNITED STATES OF AMERICA]

(8) MY FIRST OUTING.

ONCE, when the dengue fever was raging in Calcutta, some portion of our extensive family had to take shelter in Chhatu Babu's river-side villa. We were among them.

This was my first outing. The bank of the Ganges welcomed me into its lap like a friend of a former birth. There, in front of the servants' quarters, was a grove of guava trees; and, sitting in the verandah under the shade of these, gazing at the flowing current through the gaps between their trunks, my days would pass. Every morning, as I awoke, I somehow felt the day coming to me like a new gilt-edged letter, with some unheard-of news awaiting me on the opening of the envelope. And, lest I should lose any fragment of it, I would hurry through my toilet to my chair outside. Everyday there was the ebb and flow of the tide on the Ganges; the various gait of so many different boats; the shifting of the shadows of the trees from west to east; and, over the fringe of shade-patches of the woods on the opposite bank, the gush of golden life-blood through the pierced breast of the evening sky. Some days would be cloudy from early morning; the opposite woods black; black shadows moving over the river. Then with a rush would come the vociferous rain, blotting out the horizon; the dim line of the other bank taking its leave in tears; the river swelling with suppressed heavings; and the moist wind making free with the foliage of the trees overhead.

I felt that out of the bowels of wall, beam and rafter, I had a new birth into the outside. In making fresh acquaintance with things, the dingy covering of petty habits seemed to drop off the world. I am sure that the sugar-cane molasses, which I had with cold *luchis* for my breakfast, could not have tasted different from the ambrosia which *Indra** quaffs in his heaven;

for, the immortality is not in the nectar but in the taster, and thus is missed by those who seek it.

Behind the house was a walled-in enclosure with a tank and a flight of steps leading into the water from a bathing platform. On one side of the platform was an immense Jambolan tree, and all round were various fruit trees, growing in thick clusters, in the shade of which the tank nestled in its privacy. The veiled beauty of this retired little inner garden had a wonderful charm for me, so different from the broad expanse of the river-bank in front. It was like the bride of the house, in the seclusion of her midday siesta, resting on a many-colored quilt of her own embroidering, murmuring low the secrets of her heart. Many a midday hour did I spend alone under that Jambolan tree dreaming of the fearsome kingdom of the Yakshas* within the depths of the tank.

I had a great curiosity to see a Bengal village. Its clusters of cottages, its thatched pavilions, its lanes and bathing places, its games and gatherings, its fields and markets, its life as a whole as I saw it in imagination, greatly attracted me. Just such a village was right on the other side of our garden wall, but it was forbidden to us. We had come out, but not into freedom. We had been in a cage, and were now on a perch, but the chain was still there.

One morning two of our elders went out for a stroll into the village. I could not restrain my eagerness any longer, and, slipping out unperceived, followed them for some distance. As I went along the deeply shaded lane, with its close thorny *scora* hedges, by the side of the tank covered with green water weeds, I rapturously took in picture after picture. I still remember the man with bare body, engaged in a belated toilet on the edge of the tank, cleaning his

* The Jupiter Pluvius of Hindu Mythology.

* The King of the Yakshas is the Pluto of Hindu Mythology.

teeth with the chewed end of a twig. Suddenly my elders became aware of my presence behind them. "Get away, get away, go back at once!" they scolded. They were scandalised. My feet were bare, I had no scarf or upper-robe over my tunic, I was not dressed fit to come out; as if it was my fault! I never owned any socks or superfluous apparel, so not only went back disappointed for that morning, but had no chance of repairing my shortcomings and being allowed to come out any other day. However though the Beyond was thus shut out from behind, in front the Ganges freed me from all bondage, and my mind, whenever it listed, could embark on the boats gaily sailing along, and hie away to lands not named in any geography.

This was forty years ago. Since then I have never set foot again in that *champak*-shaded villa garden. The same old house and the same old trees must still be there, but I know it cannot any longer be the same—for where am I now to get that fresh feeling of wonder which made it what it was?

We returned to our Jorasanko house in town. And my days were as so many mouthfuls offered up to be gulped down into the yawning interior of the Normal School.

(9) PRACTISING POETRY.

That blue manuscript book was soon filled, like the hive of some insect, with a network of variously slanting lines and the thick and thin strokes of letters. The eager pressure of the boy writer soon crumpled its leaves; and then the edges got frayed, and twisted up claw-like as if to hold fast the writing within; till at last, down what river *Baitarani** I know not, its pages were swept away by merciful oblivion. Anyhow they escaped the pangs of a passage through the printing press and need fear no birth into this vale of woe.

I cannot claim to have been a passive witness of the spread of my reputation as a poet. Though Satkari Babu was not a teacher of our class he was very fond of me. He had written a book on Natural History—wherein I hope no unkind humorist will try to find a reason for such fondness. He sent for me one day and asked: "So you write poetry, do you?" I did not conceal the fact. Since then he would now

and then ask me to complete a quatrain by adding a couplet of my own to one given by him.

Gobinda Babu of our school was very dark, and short and fat. He was the Superintendent. He sat, in his black suit, with his account books, in an office room on the second storey. We were all afraid of him, for he was the rod-bearing judge. One day I had escaped from the attentions of some bullies into his room. The persecutors were five or six older boys. I had no one to bear witness on my side—except my tears. I won my case and since then Govinda Babu had a soft corner in his heart for me.

One day he called me into his room during the recess. I went in fear and trembling but had no sooner stepped before him than he also accosted me with the question: "So you write poetry?" I did not hesitate to make the admission. He commissioned me to write a poem on some high moral precept which I do not remember. The amount of condescension and affability which such a request coming from him implied can only be appreciated by those who were his pupils. When I finished and handed him the verses next day, he took me to the highest class and made me stand before the boys. "Recite," he commanded. And I recited loudly.

The only praiseworthy thing about this moral poem was that it soon got lost. Its moral effect on that class was far from encouraging—the sentiment it aroused being not one of regard for its author. Most of them were certain that it was not my own composition. One said he could produce the book from which it was copied, but was not pressed to do so; the process of proving is such a nuisance to those who want to believe. Finally the number of seekers after poetic fame began to increase alarmingly; moreover their methods were not those which are recognised as roads to moral improvement.

Nowadays there is nothing strange in a youngster writing verses. The glamour of poesy is gone. I remember how the few women who wrote poetry in those days were looked upon as miraculous creations of the Deity. If one hears to-day that some young lady does not write poems one feels sceptical. Poetry now sprouts long before the highest Bengali class is reached; so that no modern Gobinda Babu would have taken any notice of the poetic exploit I have recounted.

* Corresponding to Lethe.

(10) SRIKANTHA BABU.

At this time I was blessed with a hearer the like of whom I shall never get again. He had so inordinate a capacity for being pleased as to have utterly disqualified him for the post of critic in any of our monthly Reviews. The old man was like a perfectly ripe Alfonso mango—not a trace of acid or coarse fibre in his composition. His tender clean-shaven face was rounded off by an all-pervading baldness; there was not the vestige of a tooth to worry the inside of his mouth; and his big smiling eyes gleamed with a constant delight. When he spoke in his soft deep voice, his mouth and eyes and hands all spoke likewise. He was of the old school of Persian culture and knew not a word of English. His inseparable companions were a hubble-bubble at his left, and a *sitar* on his lap; and from his throat flowed song unceasing.

Srikantha Babu had no need to wait for a formal introduction, for none could resist the natural claims of his genial heart. Once he took us to be photographed with him in some big English photographic studio. There he so captivated the proprietor, with his artless story, in a jumble of Hindustani and Bengali, of how he was a poor man, but badly wanted this particular photograph taken, that the man smilingly allowed him a reduced rate. Nor did such bargaining sound at all incongruous in that unbending English establishment, so naive was Srikantha Babu, so unconscious of any possibility of giving offence. He would sometimes take me along to a European missionary's house. There, also, with his playing and singing, his caresses of the missionary's little girl and his unstinted admiration of the little booted feet of the missionary's lady, he would enliven the gathering as no one else could have done. Another behaving so absurdly would have been deemed a bore, but his transparent simplicity pleased all and drew them to join in his gaiety.

Srikantha Babu was impervious to rudeness or insolence. There was at the time a singer of some repute retained in our establishment. When the latter was the worse for liquor he would rail at poor Srikantha Babu's singing in no very choice terms. This he would bear unflinchingly, with no attempt at retort. When at last the man's incorrigible rudeness brought about his dismissal Srikantha Babu anxiously inter-

ceded for him. "It was not he, it was the liquor," he insisted.

He could not bear to see anyone sorrowing or even to hear of it. So when any one of the boys wanted to torment him they had only to read out passages from Vidya-sagar's "Banishment of Sita"; whereat he would be greatly exercised, thrusting out his hands in protest and begging and praying of them to stop.

This old man was the friend alike of my father, my elder brothers and ourselves. He was of an age with each and everyone of us. As any piece of stone is good enough for the fletcher to dance round and gambol with, so the least provocation would suffice to make him beside himself with joy. On one occasion I had composed a hymn, and had not failed to make due allusion to the trials and tribulations of this world. Srikantha Babu was convinced that my father would be overjoyed at such a perfect gem of a devotional poem. With unbounded enthusiasm he volunteered to personally acquaint him with it. By a piece of good fortune I was not there at the time but heard afterwards that my father was hugely amused that the sorrows of the world should have so early moved his youngest son to the point of versification. I am sure Gobinda Babu, the superintendent, would have shown more respect for my effort on so serious a subject.

In singing I was Srikantha Babu's favorite pupil. He had taught me a song: "No more of **Raja** for me," and would drag me about to everyone's rooms and get me to sing it to them. I would sing and he would thrum an accompaniment on his *sitar* and when we came to the chorus he would join in, and repeat it over and over again, smiling and nodding his head at each one in turn, as if nudging them on to a more enthusiastic appreciation.

He was a devoted admirer of my father. A hymn had been set to one of his tunes, "For He is the heart of our hearts." When he sang this to my father Srikantha Babu got so excited that he jumped up from his seat and alternately violently twanged his *sitar* as he sang: "For He is the heart of our hearts" and then waved his hand about my father's face as he changed the words to "For *you* are the heart of our hearts."

When the old man paid his last visit to

* Krishna's playground.

my father, the latter, himself bed-ridden, was at a river-side villa in Chinsurah. Srikantha Babu, stricken with his last illness, could not rise unaided and had to push open his eyelids to see. In this state, tended by his daughter, he journeyed to Chinsurah from his place in Birbhoom. With a great effort he managed to take the dust of my father's feet and then return to his lodgings in Chinsurah where he breathed his last a few days later. I heard afterwards from his daughter that he went to his eternal youth with the song "How sweet is thy mercy, Lord!" on his lips.

(11) OUR BENGALI COURSE ENDS.

At School we were then in the class below the highest one. At home we had advanced in Bengali much further than the subjects taught in the class. We had been through Akshay Datta's book on Popular Physics, and had also finished the epic of Meghnadvadha. We read our physics without any reference to physical objects and so our knowledge of the subject was correspondingly bookish. In fact the time spent on it had been thoroughly wasted; much more so to my mind than if it had been wasted in doing nothing. The Meghnadvadha, also, was not a thing of joy to us. The tastiest tit-bit may not be relished when thrown at one's head. To employ an epic to teach language is like using a sword to shave with—sad for the sword, bad for the chin. A poem should be taught from the emotional standpoint; inveigling it into service as grammar-cum-dictionary is not calculated to propitiate the divine Saraswati.

All of a sudden our Normal School career came to an end; and thereby hangs a tale. One of our school teachers wanted to borrow a copy of my grandfather's life by Mitra from our library. My nephew and classmate Satya managed to screw up courage enough to volunteer to mention this to my father. He came to the conclusion that every-day Bengali would hardly do to approach him with. So he concocted and delivered himself of an archaic phrase with such meticulous precision that my father must have felt our study of the Bengali language had gone a bit too far and was in danger of over-reaching itself. So the next morning, when according to our wont our table had been placed in the south verandah, the blackboard hung up on a

nail in the wall, and everything was in readiness for our lessons with Nilkamal Babu, we three were sent for by my father to his room upstairs. "You need not do any more Bengali lessons," he said. Our minds danced for very joy.

Nilkamal Babu was waiting downstairs, our books were lying open on the table, and the idea of getting us to once more go through the Meghnadvadha doubtless still occupied his mind. But as on one's death-bed the various routine of daily life seems unreal, so, in a moment, did everything, from the Pandit down to the nail on which the blackboard was hung, become for us as empty as a mirage. Our sole trouble was how to give this news to Nilkamal Babu with due decorum. We did it at last with considerable restraint, while the geometrical figures on the blackboard stared at us in wonder and the blank verse of the Meghnadvadha looked blankly on.

Our Pandit's parting words were: "At the call of duty I may have been sometimes harsh with you—do not keep that in remembrance. You will learn the value of what I have taught you later on."

Indeed I have learnt that value. It was because we were taught in our own language that our minds quickened. Learning should as far as possible follow the process of eating. When the taste begins from the first bite, the stomach is awakened to its function before it is loaded, so that its digestive juices get full play. Nothing like this happens, however, when the Bengali boy is taught in English. The first bite bids fair to wrench loose both rows of teeth—like a veritable earthquake in the mouth! And by the time he discovers that the morsel is not of the genus stone, but a digestible bon bon, half his allotted span of life is over. While one is choking and spluttering over the spelling and grammar, the inside remains starved, and when at length the taste is felt, the appetite has vanished. If the whole mind does not work from the beginning its full powers remain undeveloped to the end. While all around was the cry for English teaching, my third brother was brave enough to keep us to our Bengali course. To him in heaven my grateful reverence.

(12) THE PROFESSOR.

On leaving the Normal School we were sent to the Bengal Academy, a Eurasian

institution. We felt we had gained an access of dignity, that we had grown up—at least into the first storey of freedom. In point of fact the only progress we made in that academy was towards freedom. What we were taught there we never understood, nor did we make any attempt to learn, nor did it seem to make any difference to anybody that we did not. The boys here were annoying but not disgusting—which was a great comfort. They wrote ASS on their palms and slapped it on to our backs with a cordial "hello!" They gave us a dig in the ribs from behind and looked innocently another way. They dabbed banana pulp on our heads and made away unperceived. Nevertheless it was like coming out of slime on to rock—we were worried but not soiled.

This school had one great advantage for me. No one there cherished the forlorn hope that boys of our sort could make any advance in learning. It was a petty institution with an insufficient income, so that we had one supreme merit in the eyes of its authorities—we paid our fees regularly. This prevented even the Latin Grammar from proving a stumbling block, and the most egregious of blunders left our backs unscathed. Pity for us had nothing to do with it—the school authorities had spoken to the teachers!

Still, harmless though it was, after all it was a school. The rooms were cruelly dismal with their walls on guard like policemen. The house was more like a pigeon-holed box than a human habitation. No decoration, no pictures, not a touch of colour, not an attempt to attract the boyish heart. The fact that likes and dislikes form a large part of the child mind was completely ignored. Naturally our whole being was depressed as we stepped through its doorway into the narrow quadrangle—and playing truant became chronic with us.

In this we found an accomplice. My elder brothers had a Persian tutor. We used to call him Munshi. He was of middle age and all skin and bone, as though dark parchment had been stretched over his skeleton without any filling of flesh and blood. He probably knew Persian well, his knowledge of English was quite fair, but in neither of these directions lay his ambition. His belief was that his proficiency in singlestick was matched only by his skill in song. He would stand in the sun in the middle of

our courtyard and go through a wonderful series of antics with a staff—his own shadow being his antagonist. I need hardly add that his shadow never got the better of him and when at the end he gave a great big shout and whacked it on the head with a victorious smile, it lay submissively prone at his feet. His singing, nasal and out of tune, sounded like a gruesome mixture of groaning and moaning coming from some ghost-world. Our singing master Vishnu would sometimes chaff him: "Look here, Munshi, you'll be taking the bread out of our mouths at this rate!" To which his only reply would be a disdainful smile.

This shows that the Munshi was amenable to soft words; and in fact, whenever we wanted we could persuade him to write to the school authorities to excuse us from attendance. The school authorities took no pains to scrutinise these letters, they knew it would be all the same whether we attended or not, so far as educational results were concerned.

I have now a school of my own in which the boys are up to all kinds of mischief, for boys will be mischievous—and schoolmasters unforgiving. When any of us are beset with undue uneasiness at their conduct and are stirred into a resolution to deal out condign punishment, the misdeeds of my own schooldays confront me in a row and smile at me.

I now clearly see that the mistake is to judge boys by the standard of the grown-ups, to forget that a child is quick and mobile like a running stream; and that, in the case of such, any touch of imperfection need cause no great alarm, for the speed of the flow is itself the best corrective. When stagnation sets in then comes the danger. So it is for the teacher, more than the pupil, to beware of wrong doing.

There was a separate refreshment room for Bengali boys for meeting their caste requirements. This was where we struck up a friendship with some of the others. They were all older than we. One of these will bear to be dilated upon.

His speciality was the art of Magic, so much so that he had actually written and published a little booklet on it, the front page of which bore his name with the title of Professor. I had never before come across a school-boy whose name had appeared in print, so that my reverence for him—as a professor of magic I mean—was

profound. How could I have brought myself to believe that anything questionable could possibly find place in the straight and upright ranks of printed letters? To be able to record one's own words in indelible ink—was that a slight thing? To stand unscreened and unabashed, self-confessed before the world,—how could one withhold belief in the face of such supreme self-confidence? I remember how once I got the types for the letters of my name from some printing press, and what a memorable thing it seemed when I inked and pressed them on paper and found my name imprinted.

We used to give a lift in our carriage to this schoolfellow and author-friend of ours. This led to visiting terms. He was also great at theatricals. With his help we erected a stage on our wrestling ground with painted paper stretched over a split bamboo framework. But a peremptory negative from upstairs prevented any play from being acted thereon.

A comedy of errors was however played later on without any stage at all. The author of this has already been introduced to the reader in these pages. He was none other than my nephew Satya. Those who beheld his present calm and sedate demeanour would be shocked to learn of the tricks of which he was the originator.

The event of which I am writing happened sometime afterwards when I was twelve or thirteen. Our magician friend had told of so many strange properties of things that I was consumed with curiosity to see them for myself. But the materials of which he spoke were invariably so rare or distant that one could hardly hope to get hold of them without the help of Sinbad the sailor. Once, as it happened, the Professor forgot himself so far as to mention accessible things. Who could ever believe that a seed dipped and dried twenty-one times in the juice of a species of cactus would sprout and flower and fruit all in the space of an hour? I was determined to test this, not daring withal to doubt the assurance of a Professor whose name appeared in a printed book.

I got our gardener to furnish me with a plentiful supply of the milky juice, and betook myself on a Sunday afternoon, to our mystic nook in a corner of the terraced roof, to experiment with the stone of a mango. I was wrapt in my task of dip-

ping and drying—but the grown-up reader will probably not wait to ask me the result. In the meantime, I little knew that Satya, in another corner, had, in the space of an hour, caused to root and sprout a mystical plant of his own creation. This was to bear curious fruit later on.

After the day of this experiment the Professor rather avoided me, as I gradually came to perceive. He would not sit on the same side in the carriage, and altogether seemed to fight shy of me.

One day, all of a sudden, he proposed that each one in turn should jump off the bench in our schoolroom. He wanted to observe the differences in style, he said. Such scientific curiosity did not appear queer in a professor of magic. Every one jumped, so did I. He shook his head with a subdued "h'm." No amount of persuasion could draw anything further out of him.

Another day he informed us that some good friends of his wanted to make our acquaintance and asked us to accompany him to their house. Our guardians had no objection, so off we went. The crowd in the room seemed full of curiosity. They expressed their eagerness to hear me sing. I sang a song or two. Mere child as I was I could hardly have bellowed like a bull. "Quite a sweet voice," they all agreed.

When refreshments were put before us they sat round and watched us eat. I was bashful by nature and not used to strange company; moreover the habit I acquired during the attendance of our servant Iswar left me a poor eater for good. They all seemed impressed with the delicacy of my appetite.

In the fifth act I got some curiously warm letters from our Professor which revealed the whole situation. And here let the curtain fall.

I subsequently learnt from Satya that while I had been practising magic on the mango seed, he had successfully convinced the Professor that I was dressed as a boy by our guardians merely for getting me a better schooling, but that really this was only a disguise. To those who are curious in regard to imaginary science I should explain that a girl is supposed to jump with her left foot forward, and this is what I had done on the occasion of the Professor's trial. I little realised at the time what a tremendously false step mine had been!

SURENDRANATH TAGORE.

KALIDASA, THE SPIRIT OF ASIA

BY PROF. BENOY KUMAR SARKAR, M.A.

[T was a New India, the India of the Guptas—a new stage, new actors, and what is more, a new outlook. Extensive diplomatic relations with foreign powers, military renown of “digvijaya” [conquest of the four quarters] at home, overthrow of the ‘barbarians’ on the western borderland, international trade, maritime activity, expansion of the motherland, missionising abroad, the blending of races by which the flesh and blood of the population was almost renewed, and social transformation as epoch-making as the first Aryanisation itself—all these ushered in in the fourth and fifth centuries of the Christian era a thorough rejuvenation and a complete overhauling of the old order of things in Hindusthan. The Indians of the Vikramadityan era started their life afresh—with young eyes and renovated mentality. Hindu tradition has ever known this to be the age of “Navaratna” (or Nine Gems, *i. e.*, celebrities). Sir R. G. Bhandarkar of Bombay, calls it the age of Hindu Renaissance. Mr. Vincent Smith says :

“The Gupta period, taken in a wide sense as extending from about A. D. 300 to 650, and meaning more particularly the fourth and fifth centuries, was a time of exceptional intellectual activity in many fields—a time not unworthy of comparison with the Elizabethan and Stuart period in England. In India all the lesser lights are outshone by the brilliancy of Kalidasa, as in England all the smaller authors are overshadowed by Shakespeare. But, as the Elizabethan literature would still be rich, even if Shakespeare had not written, so in India, if Kalidasa’s works had not survived, enough of other men’s writings would remain to distinguish his age as extraordinarily fertile in literary achievement.”

If it is at all necessary to single out one name as a synonym for India and Hindu culture, it is not that of Manu, Yajñavalkya, Sakyasimha, Asoka, Samudragupta, Sankaracharya, Tulsidasa, Sivaji or Chaitanya, but of Kalidasa, the poet of the 4th-5th century A.D. If it is at all possible to regard any one work as the embodiment of Indianism, it is not the *Rig Veda*, the *Arthashastra*, the *Tripitaka*, *Gita*, *Vedanta*, *Kural* (Tamil work—3rd century A.D.) *Sakuntala*, *Dasa-bodha* (Marathi work—17th century), or *Kavikankana Chandi* (Bengali work—17th century), but the *Raghu-vamsam* of Kalidasa. And if it is required to point to single passages in this epic which may

be regarded as the most convenient *Sutra* or mnemonic formula for *Indono Damashii* (the spirit of Hindusthan), these are :—

A-samudra-kshitishanam
*A-naka-ratha-vartmanam**
Vardhakye muni-vrittinam
Yogenante tanutyajam.

i. e., Lords of the lithosphere from sea to sea,
Commanding the atmosphere by chariots of air;
Adopters of the life of the silent sage when old,
And passing away at last through Yoga’s aid.

These four phrases occur in the very prelude to *Raghu-vamsam* where the poet invokes the deities to help him in describing the achievements of the House of Raghu. The following English translation is by Griffith :

“Yes, I will sing, although the hope be vain
To tell their glories in a worthy strain,
Whose holy flame in earliest life was won,
Who toiled unresting till the task was done.
Far as the distant seas allowed their sway ;
High as the heaven none checked their lofty way,
Constant in worship, prompt in duty’s call,
Swift to reward the good, the bad appall,
They gathered wealth, but gathered to bestow,
And ruled their words that all their truth might know.
In glory’s quest they risked their noble lives ;
For love and children, married gentle wives,
On holy lore in childhood’s days intent,
In love and joy their youthful prime they spent,
As hermits, mused, in life’s declining day,
Then in Devotion dreamed their souls away.”

Here is a Hegelian synthesis of opposites—the Machiavellian Kautilya shaking hands with the *Nirvanist* Sakyasimha. Here are secularism and other-worldliness welded together into one artistic whole, a full harmony of comprehensive life. This is Indianism ; and if ‘the East is East,’ this is that East.

European travellers in ancient and mediæval times were impressed by the “wealth of Ormus and of Ind” and the “barbaric pearls and gold” of “the gorgeous East.” They had no philosopher like Matthew Arnold going out of his way to poetise about ‘the legion,’ nor a stylist like Kipling to write pseudo-anthropological stories about foreign races and to start fascinating theories of race-psychology. They, therefore, did not notice any abnormal mentalities in the Orient, but found activity and the joy of life scattered

* Literally, whose chariot-tracks went up to the skies. Pseudo-scientists may read in this and similar other passages in Sanskrit an anticipation of aeroplanes.

everywhere. The globe-trotters of the steam-age, however, begin their first lessons in Oriental lore with the dictum that "the East is East, and the West is West." They, therefore, make it a point to find evidences of 'Oriental Sun,' 'Oriental atmosphere,' 'Oriental lethargy,' 'Oriental intrigue,' 'Oriental superstition,' 'Oriental corruption,' and 'Oriental immorality.' To make "confusion worse confounded," historians and philosophers who ought to be able to dive beneath the surface have been misled by the theory of Schopenhauer about Hindu pessimism. Though Schopenhauer's ideas do not count for much in the present day life and philosophy of the western world, the cue supplied by him regarding the Orient bids fair to be a permanent superstition with those who should understand better.

That Hindu culture could have expressed itself in an objective philosophy of energism and positivism would, therefore, appear paradoxical to those who have been taught to know India only in her subjective metaphysics of Nirvanism and mysticism. Strictly speaking, each represents 'the truth, and nothing but the truth,' but not 'the whole truth'; for, as the poet has said, "we are but parts and can see only but parts." As for the travellers of ancient and mediæval times, or the tourists and scholars of the modern world, they have certainly seen only parts, because they came to see only parts. They were *specialists* commissioned to study definite interests. Thus there have been political ambassadors like Megasthenes, commercial agents like Marco Polo and Tavernier, sightseers, curio-hunters, and sensation-mongers, newspaper-reporters who are deputed to get the 'inside view' of things, Christian missionaries who must force their gospel, archaeologists whose interests, if really honest, must only be the unearthing of 'fossils' from the dead past, and others, who like all these have been born into the faith that the Oriental human beings belong to a fundamentally inferior race.

The whole India is an organic synthesis of the two philosophies. That synthesis cannot be interpreted fully by bringing about a mechanical adjustment of the conflicting reports of tourists and scholars. To unbiased students of the philosophy of history, however, that is the only frame-

work through which the signs of life have to be read. Besides, the synthetic race-ideal can be studied only in the representative creations of constructive national imagination. Hindu Culture found its best expression in the mind and art of Kalidasa. For the complete view of Indian life and thought, therefore, one should turn to Kalidasan literature. And to do justice to it one must apply the same method of literary criticism as is used in the interpretation of Dante, Shakespeare, Voltaire and Goethe as exponents of their times. A part of my remarks on the *Raghu-vamsam* of Kalidasa made elsewhere * may be reproduced in this connexion.

"It is impossible to study it from cover to cover without noticing how profoundly the greatest poet of Hindusthan has sought to depict this Hindu ideal of synthesis and harmony between the positive and the transcendental, the *bhoga* (enjoyment) and *tyaga* (renunciation). *Raghu vamsam* is the embodiment of Hindu India in the same sense that *Paradise Lost* is the embodiment of Puritan England. The grand ambitions of the Vikramadityanera, its colossal energies, its thorough mastery over the things of the world, its all-round economic prosperity and brilliant political position, its Alexandrian sweep, its proud and stately outlook, its vigorous and robust taste are all graphically painted in this national epic, together with the 'devotion to something afar from the sphere of our sorrow,' the 'light that never was on sea or land,' the *sanyasa*, *vairagya*, *ahimsa*, *yoga*, the preparation for the other world, the idea of nothingness of this world, and the desire for *mukti* or the perpetual freedom from bondage.

This antithesis, polarity or duality has not, however, been revealed to us as a hotchpotch of hurly-burly and pell-mell conflicts and struggles, but presented in a serene, sober and well-adjusted system of harmony and synthesis—which gives 'the World, the Flesh, and the Devil' their due, which recognises the importance and dignity of the secular, the worldly, and the positive, and which establishes the transcendental, *not to the exclusion of*, but only *above*, as well as *in* and *through*, the civic, social and economic achievements."

It was when this synthetic idea of the One in the Many, the Infinite in the Finite, and the Transcendental in the Positive, was uttering itself in literature, sculpture, mythology and philosophy, that Hindusthan first became what may truly be called the school of Asia. Kalidasa as the embodiment of Hindu nationalism is thus the spirit of Asia. Nobody understands Asia who does not understand Kalidasa. He is the "God-gifted organ-voice" of the Orient.

* Foreword to *The Positive Background of Hindu Sociology* (Panini Office, Allahabad, India).

INTERMARRIAGE BETWEEN HINDU CASTES AND SUB-CASTES

BY CHIMANLAL MAGANLAL DOCTOR, M.A., LL.B.,
ASSISTANT LEGAL REMEMBRANCER, BARODA STATE.

HINDU society, from times immemorial, has been divided into the four main castes or Varnas, viz., Brahmin, Kshatriya, Vaishya, and Sudra. These castes were in their origin elastic, but in the course of time, they became rigid and were themselves sub-divided into a number of sub-castes. Castes of mixed origin grew up, and the system became crystallised into the present multiple caste-system. Under the older Smritis like that of Manu, the marriage of a male of a higher caste with a female of a lower caste was allowed, while the marriage of a female of a higher caste with a male of a lower caste was discountenanced. The former type of marriages was called Anuloma, while the latter type was known as Pratiloma. Although Anuloma marriages were permitted by Hindu law in the days of the Smritis, they became obsolete in the course of centuries, and during the confusion created by successive Mahomedan invasions, every group tried to protect itself against any admixture of blood by strictly restricting the field for marriage. The result has been that not only intermarriage has become obsolete between interdining sub-castes, but in some parts of India and especially in Gujarat, persons of the same sub-caste belonging to some limited number of towns and villages have formed themselves into "rings" for purposes of marriage, beyond which no person can give girls in marriage, even to persons of the same sub-caste as themselves without incurring the penalty of a fine and in some cases excommunication. The "rings" many times defend this restriction on the ground that it ensures a sufficient supply of marriageable girls for their boys. The result is that girls have sometimes to be married to illiterate persons, who may not be able even to support a family, owing to the paucity of suitable husbands in the "ring." Very few people have the moral courage to kick at these intolerable fetters, and educated Hindu India suffers the evils in silence.

The Social Reform Conferences piously pass a resolution about intermarriage between interdining sub-castes every year but no practical results have yet been achieved. This is a reform in which both the orthodox and reformers can co-operate, since there is no text of Hindu law or religion that prohibits intermarriage between interdining sub-castes. I will go further and say that there is no reason why we should not have intermarriages between subdivisions of the same main Varna whether they interdine or not. We may also restore the practice of Anuloma-marriages which was prevalent in ancient India. But before we deal with the steps that may be taken in these directions, it will be well to examine the legal aspects of the question.

Later authorities have laid down that the twice-born shall marry girls of equal caste (सम्बन्ध) in the Kali age. Some writers only admit the existence of the Brahmin and Sudra castes at present and say that the Vaishya and Kshatriya castes do not exist. But this question has been set at rest by the Privy Council in 7 M. L. A. P. 18 (Chuturya Run Murdan Syn v. Sahab Puhulad Syn) where it judicially recognises the existence of the Kshatriya caste and says "the courts in all cases assume that the four great classes remain."

But the practical question now in such cases is "what constitutes a difference of caste sufficient to prevent intermarriage." And this is a very difficult point to decide. Whether some of the castes such as the Kayasthas and others are really Sudras or not, whether the Vaidyas are a mixed caste or are genuine Vaishyas are questions which are sometimes keenly contested in the courts in India.

In Bengal, in 9 Suth. W. R. 552, Melaram v. Thanooram, where a Dome Brahmin had married a girl of the Haree caste, the High Court held that local custom is the only authority by which such marriage can be sanctioned, the general Hindu law being against it. In another case (Narain

Dhara v. Rakhal Gain I.L.R. 1. Cal; 23 W.R. 334) where the legality of a marriage between a man of the Kaivarta caste and a woman of the Tantee caste was one of the points for decision, Mr. Justice Romesh Chunder Mitter said:

"Marriage between parties in different subdivisions of the Sudra caste is prohibited unless sanctioned by any special custom, and no presumption in favour of the validity of such marriage can be made, although long cohabitation has existed between the parties."

And although Justice Markby expressed a doubt on the point, he concurred in remanding the case to the first court to try whether by any usage or custom there could be any valid marriage between the parties in question. The first of these cases was decided, before the Privy Council took the contrary view in two Madras cases, while the latter case seems to have been decided after the Privy Council decisions. The first of the Madras cases was that of Pandaiya Telavar v. Puli Telavar (1 M.H.C. 478) where Sir Colley Scotland C. J. said:—

"It is not, however, to be understood that supposing the late Zamindar and the second plaintiff had been of different castes, the marriage would, in my opinion, have been invalid. The general law applicable to all the classes or tribes does not seem opposed to marriage between individuals of different sects or divisions of the same class or tribe, and even as regards the marriage between individuals of a different class or tribe, the law appears to be no more than directory. Although it recommends and inclines a marriage with a woman of equal class as a preferable description, yet the marriage of a man with a woman of a lower class or tribe than himself appears not to be an invalid marriage, rendering the issue illegitimate (Manu Ch. III. Cl. 12, et seq; Mitakshara, Ch. I. Sec. 11 Clause 2 and note; 1 Strange's Hindu Law, p. 19). According to this view of the law, there being no proof of special custom or usage, the marriage would be valid, even though the parties had been of different sects or caste divisions of the fourth or Sudra caste."

And Justice Holloway in his judgment in the same case observed:

"Moreover, it is not invalid if it took place because of the difference of class. The opinion of the Plaintiffs, as usual, vague and unsatisfactory. As the twice-born is instructed to marry a wife of the same class with himself, the reasonable inference is that upon one who is not twice-born the precept is not binding."

"Further I am of opinion that the classes spoken of are the four classes recognized by Manu and not the infinite subdivisions of these classes introduced in the progress of time. I think, therefore, that being a Sudra, the woman was of the same class in the sense of the authority quoted."

On appeal to the Privy Council (13 M.I.A. p. 141, 12.W.R.&P.C. 41) their Lordships of the Privy Council observed:—

"Then if there was a marriage in fact, was there a marriage in law? When once you get to this, viz., that there was a marriage in fact, there would be a presumption in favour of their being a marriage in law. The opinions are matter of reasoning, and where they refer to authority which applies to persons of two different but higher castes, not to the Sudra caste at all, and still less to what may be called different classes or divisions of one and the same Sudra caste."

"It would be a most unlikely thing for a person of his (Zamindar's) caste to go through the ceremony of marriage which was invalid in law; ... and on the whole, seeing that these parties are both of the Sudra caste and that the utmost that has been alleged really is that the Zamindar was one part of the Sudra caste, and the lady to whom he was married was of another part, or of a sub-caste, their Lordships hold the marriage to have been valid; to hold the contrary would in fact be introducing a new rule and a rule which ought not to be countenanced."

In 14 M. I. A. 346, the Privy Council held that a marriage between a Zamindar of the Malavar class, a sub-division of the Sudra caste, with a woman of the Vellala (superior) class of Sudras was valid by Hindu Law.

The above Privy Council decisions seem to take a view contrary to that of Mr. Romesh Chunder Mitter in the two Bengal cases quoted above, and in (I. L. R. 15 Cal. 708, Upoma Kuchain v. Bholaram Dhubi), where the marriage of the plaintiff, a Dhubi or washerman, with the defendant, a fisherwoman, was held valid, the Calcutta High Court observed:

"We think that these decisions (13. M. I. A. 141, 14 M. I. A. 346) are conclusive as to there being no rule of law regarding such marriages being invalid. It is true that the cases referred to were cases from the Madras Presidency; but it has not been shown to us, that in this respect any principle of Hindu Law followed in that Presidency is inapplicable to the Presidency of Bengal; nor has any case or any authority from ancient writers been cited to show that such marriages are invalid. Mr. Mayne in his work on Hindu Law treats such marriages as obsolete; and most probably they are so in the more advanced parts of Bengal in which castes have been sub-divided in such a way that the sub-divisions are regarded as distinct castes in themselves. But the fact that these marriages are not resorted to is no ground for holding that they are invalid according to law..... We hold, therefore, that there is nothing in the Hindu Law prohibiting a marriage between the parties to this suit."

On this, Dr. Gurudas Banerji, an eminent authority on Hindu Law, in his "Hindu Law of Marriage and Stridhan," observes,

"This may be true for the Madras Presidency, but in Bengal the state of things is very different, and Mr. Justice Mitter's opinion is quite in accordance with the prevailing practice of the people of that province. The case under notice came from Assam where the sub-divisions of the Sudra caste may not be so well marked as in Bengal proper. But it would

create quite a revolution in Hindu Society in Bengal, if the rule laid down in this case were to be applied generally."

In 18 Cal. 264, *re* Ramkumari, it was held that where one or both parties to a marriage are illegitimate, it will be valid if they are in fact recognized by their castemen as belonging to the same caste.

Turning to Bombay, we find that in I. L. R. 22 Bom. p. 277 (*Fakir Ganda v. Gangi*) the Bombay High Court held that according to the Hindu Law, marriages between members of different sects of Lingayats are not illegal, and where it is alleged that such a marriage is invalid, the onus lies upon the persons making such allegation of proving that such marriage is prohibited by immemorial custom. Hosking J. in that case said that the status of Lingayats as Sudras was determined by the judgment of the Bombay High Court in *Gopal v. Hanumant*, I.L.R. 3 Bom. p. 273. In another case (I. L. R. 33 Bom. P. 693), a marriage between a man of the Panchal (artificer) caste and a woman of the Kurbar (shepherd) caste was held to be valid. The Panchals and the Kurbars are sub-divisions of the Sudra caste. It was also held that the onus lies upon the party alleging the illegality by reason of immemorial custom to prove such prohibiting custom.

In the foregoing cases we have dealt with the intermarriage between different sub-divisions of the Sudra caste, and now we shall turn our attention to the law relating to the intermarriage between the upper classes. In *Ramlal Shookool v. Akhoy Charan Mitter* (7 Cal. W.N. p. 612) the question was as regards the marriage of Kayasthas and Vaidyas. The Sub-Judge had treated them as Sudras and hence held a marriage between them valid. On the case going up in appeal to the High Court, it said,

"It cannot be disputed that his (Chandrakant Sen's) mother a Kayastha and therefore a Sudra married his father a Vaishya. The ancient Hindu law did not regard such marriages with the condemnation expressed by later authorities which have been accepted by our courts so as to make children born from such unequal marriage illegal. But however that may be, there is ample evidence set out in the judgment of the Sub-Judge, on which it must be held that such marriages as in the present case are recognised by local custom in the District of Tippera and that there is no instance in which their validity has been questioned. We agree with the Sub-Judge in holding that such marriages are in accordance with local custom in Tippera and are valid."

On the other hand, in I. L. R. 28 All. p. 458, *Padamkumari v. Surajkumari*, the Allahabad High Court held that whatever may have been the case in ancient times, and whatever may be the law in other parts of India, at the present day the marriage between a Brahmin and a Chhettri is not a lawful marriage in these provinces and the issue of such marriage is not legitimate. While the Calcutta High Court holds the marriage of a Vaishya and Sadra valid by custom, the Allahabad High Court declares the marriage of a Brahmin and Chhettri illegal, apparently irrespective of custom.

In a Punjab case (*Haria v. Kanhya*, Punj. R. Vol. 13, p. 325) it was held that the marriage of a Rajput with a Khatriani woman was valid and that the onus of proving a custom to the contrary lay on the defendant.

In 130 C. 375, it was held that marriages between persons belonging to two of the four primary castes are invalid, but that this rule does not apply to marriages between persons of hybrid castes or between a person of hybrid caste and a person of one of the four principal castes.

The last case to be noted in this connection is that of *Muthusami Mudaliar, v. Masalmani* (I. L. R. 33 Mad. 312) in which the Madras High Court held that a marriage contracted according to Hindu rites with a Christian woman, who, before marriage, is converted to Hinduism, is valid when such marriages are common among and recognised as valid by the custom of the caste to which the man belongs, although such marriage may not be in strict accordance with the orthodox Hindu religion. It was also held that under the Hindu law, clear proof of usage will outweigh the written text of the law. The court further held that apart from custom, such a marriage between parties who do not belong to the twice-born classes is valid under Hindu Law; it is only persons who belong to the twice-born classes that are enjoined to marry in their own class; all other persons must be treated as Sudras, and marriages between different classes of Sudras are valid. The court also held that where a caste accepts a marriage as valid and treats the parties thereto as members of the caste, the court will not declare such a marriage null and void.

We have already quoted Dr. Gurudas

Banerji's observations on the leading Privy Council cases and shall now quote his final remarks on the subject in which he says :

"It may perhaps be laid down as a general rule, that so far as the prohibition of intermarriage between different castes is concerned, a marriage would be valid or void according as the parties to it are or are not in point of fact recognized as belonging to the same caste, irrespective of the propriety of such recognition."

Mr. J. C. Ghose in his "Hindu Law" says that sub-castes, formed by intermarriages in former times or otherwise and regarded as such should be considered distinct castes, and that English Judges have fallen into the error of considering these as sub-divisions of the same caste.

On a review of the whole law on the subject, we may safely lay down the following propositions as established at present:—

1. Intermarriage between persons belonging to different sub-divisions of the Sudra class is valid, the onus of proving invalidity by immemorial custom lying on the person who alleges such invalidity;

2. Intermarriage between persons belonging to different primary castes is invalid unless allowed by local custom as in the case of Kayasthas (Sudras) and Vaidyas (Vaishyas).

3. Intermarriage between different castes would be valid or void according as the parties to it are or are not in point of fact recognised as belonging to the same caste, irrespective of the propriety of such recognition.

4. The marriage of a Brahmin with a Chhettri is not lawful in the United Provinces.

To these, Mr. Trevelyan, in his "Hindu Family Law," adds a fifth proposition, viz.

5. That intermarriage between persons belonging to different sub-divisions of the same primary caste is valid.

As regards the first proposition, I have quoted the remarks of Dr. Gurudas Banerji at length, and in view of these observations and the opinion of Mr. J. C. Ghose, it cannot be said that the law on the subject has been finally settled. In an extreme case as that of an intermarriage between a Kayastha (Sudra) with a person belonging to one of the untouchable classes (such as a Pariah), it is very likely that the courts will hesitate to hold the marriage valid although it may be true that all Hindus who are not twice-born must be regarded as Sudras as held in 33

Madras 342. Even among the touchable Sudras in some of the advanced provinces of India like Bengal and Gujarat where the caste system prevails in all its rigidity, the different sub-divisions are regarded as distinct castes in themselves, some of whom do not even interdine with each other, it will be hazardous to say that the courts will not take a different view in future than the one taken by the Privy Council in the Madras cases, if the Privy Council chooses to over-rule their former rulings on the point taking into consideration the views of such eminent Hindu Jurists like Dr. Gurudas Banerji and Mr. J. C. Ghose.

As regards the second proposition, all intermarriages between persons belonging to different primary castes are invalid, unless allowed by local custom. It is very difficult to prove an immemorial custom so as to override the general provisions of Hindu Law, so that practically, such marriages are prohibited. Again it is only the Calcutta High Court that allows a local custom in such cases, while in Allahabad the marriage of a Brahmin with a Chhettri has been expressly held to be invalid, apparently irrespective of custom.

According to the third proposition the validity of each intermarriage will have to be decided on the merits of each case and not under a general law. It will turn upon the evidence adduced, and very few people can be tempted to try the uncertainties of the law and the varying views of different courts.

The fifth proposition will turn upon the question what present day castes belong to a particular primary caste. This is the most difficult question to solve. There are many communities which are on the border-line and it may be impossible to say whether they belong to this or that primary caste. There are other communities who claim to belong to a particular primary caste but whose claims are denied by other sister communities which have been generally recognized as belonging to that particular primary caste.

The only safe way at present of intermarrying lies in taking advantage of the provisions of the Indian Civil Marriage Act of 1872. This law is explicit and while it legalises the marriage, it avoids bastardy for the children. But the Hindus are a pre-eminently spiritual people, and they would rather do without such intermar-

riages than declare that they do not belong to any of the recognised religions of the world. Another difficulty is that the incidence of divorce attaches to all marriages under the Civil Marriage Act, which must prevent the vast majority of the twice-born classes from taking advantage of the Act inasmuch as they rightly or wrongly believe that marriage is a sacrament which can not be dissolved by divorce. These people may be very willing to intermarry, provided that all the incidents of a Hindu marriage under the Hindu Law do attach themselves to such a marriage. The present stage of the law can only allow a safe intermarriage between interlining sub-castes which recognise themselves as belonging to the same primary caste from times immemorial.

Apart from the legal aspect of the question which has been thoroughly dealt with above, there are difficulties of language, customs and manners, diet whether vegetarian or otherwise, and sometimes fundamental differences of religious faith which come in the way. A Bengal Brahmin worshipping Kali, for instance, will not be able to intermarry a strictly vegetarian Vaishnava Brahmin girl of Gujarat nor will such a marriage turn out a happy one. In such a case all the difficulties enumerated above will supervene, and it is quite necessary that these difficulties should be overcome.

Yet another difficulty is of the unwillingness of the Aryans of Northern India to intermarry with the Dravidian Hindus of Southern India where in addition to the aforesaid difficulties, the questions of race-pride and colour may prove sometimes insuperable.

I have dealt with the legal and social aspects of the question, and shown the practical difficulties that prevent intermarriage from becoming general. I shall now proceed to suggest what we should do to encourage such marriages.

The first step that suggests itself to me is the appointment of Commission by the Government of India enjoying the universal confidence of all Hindus whether orthodox or otherwise. Such a Commission should be composed of the most impartial persons, well-versed with the sacred literature of the Hindus and the actual social conditions prevailing in India. It may very well include some of the most enlightened religious heads of the Hindus

and an equal number of eminent educated Hindus like the Maharaja of Durbhanga, Dr. Gurudas Banerji, Lala Lajpat Rai and Pandit Madanmohan Malaviya. It should also have a sprinkling of enlightened Pandits and Shastris. It may be presided over by an impartial European Savant saturated with the Hindu sacred lore, or an impartial progressive Shankaracharya of any of the four Maths. Such a Commission should be empowered to report after taking evidence on the question "which present day Hindu castes and sub-castes belong to which primary caste," dividing the Sudras into touchable Sudras and untouchable Sudras. The untouchable Sudras may be treated as belonging to a fifth primary caste. I doubt how far it will be practicable to secure such an impartial Commission, but if we are really able to secure such a Commission, it will settle many delicate and thorny questions that prevent intermarriages. On the findings of the Commission, legislation may be initiated expressly declaring that intermarriage between communities found by the Commission to belong to a particular primary caste is lawful and will have all the incidents of a Hindu marriage attached to it. This will be a first step in the building up of a homogeneous Hindu nation as it will reduce much of the narrow caste spirit, and in the course of time we shall only have to deal with the question of only four or five big primary castes instead of the present thousands of castes and sub-castes. At least, so far, both the orthodox and reformers can join hands and work harmoniously together for the common national end. *Steps will have to be taken to get similar enactments passed in all the Native States, in order to secure uniformity of law for the Hindus throughout India.*

As intermarriage between persons belonging to the same primary caste is not prohibited by any text of Hindu Law, an Act should be passed enacting that any present day Hindu caste, sub-caste, or sub-division of such a caste or sub-caste or any "ring" excommunicating or in any other way punishing any person for such intermarriage will be liable to be mulcted in damages in a civil suit by the injured party as if on a recurring cause of action and on a decree being passed, the person will have to be restored to his former status and in case of refusal, the injured

party will have the right to sue for damages and restitution to his status as many times as the caste, sub-caste, sub-division or ring refuses to obey the successive decrees of the courts. Such a provision is quite essential in view of the terrors of caste-tyranny that prevail, in some parts of India and especially in Gujarat. I would even propose that members of a community taking part in excommunication or in any other way punishing a person for such intermarriage should be liable to prosecution and sentence in a criminal court on a complaint lodged by the injured party. But thinking that this may be considered too harsh, I do not press for it. Unless the law restricts the powers of the autonomous Hindu caste in some way, there is no chance of intermarriages becoming popular, and very few persons will have the moral courage to brave the terrible punishment of social ostracism passed by their caste-fellows.

Under the present circumstances, the legalising of Anuloma marriages under Hindu Law will rouse intense opposition from the orthodox classes and so it will be well to enact that local custom shall govern the validity or invalidity of such a marriage throughout India. Those however, who are desirous of contracting Anuloma or Pratiloma marriages, and wish to put them beyond doubt, should get an enactment on the lines of the celebrated Basu Bill passed for their benefit,

so that they may not be compelled to declare that they are not Hindus. They will have, however, to decide whether they wish to have the provisions relating to divorce made compulsorily applicable to such marriages or not. The scope of such an enactment will have to be confined to Hindus only, since there is a large majority of educated Hindus who abhor the idea of intermarrying with non-Hindus except Jains, Sikhs, Aryasamajists and Brahmos, who are to all intents and purposes Hindus in their ways of living and thinking.

To remove the difficulty of language, Hindi should be made the lingua franca throughout the length and breadth of India. No efforts should be spared to achieve this end, as it will go a long way in building up the future nation. Education is bound to spread, and in the course of time all other difficulties of customs and manners, diet, religious faith, race and colour will disappear at the magic touch of education. We will become more tolerant in future in such matters, more catholic in our ways of living and thinking and a day will come when a happy Hindu India will have been evolved out of the present chaos. I fervently hope that the day may soon come, and I earnestly request my fellow-countrymen to take into consideration my suggestions, and, if found feasible, to try to work them out in any way they think practicable.

THE LONDON MONEY-MARKET AND THE WAR

By K. M. PANIKKAR.

THOSE of us who take any interest in the economic world will remember with great interest the situation that arose in the early days of the international crisis. The month of August, 1914, can without hesitation be called the most critical period in monetary history. How the crisis was met and what permanent results it will have are the things that I propose to consider in this paper.

The whole fabric of international commerce is based on the assumption that peace is the normal state of things. The primary and essential characteristic of the

relations of hostility between nations, which we call war, is that it is a dislocation of the delicate mechanism of trade on which the prosperity, nay, the very existence, of the chief European States depends. War, therefore, even on a small scale, is bound to make itself felt in the economic world; and a European war in which all the leading Powers are engaged will, it is clear, automatically destroy the big edifice of international commerce.

Commerce, since it developed to its present dimensions, has unquestionably become international. Professional paci-

fists, we know, built their 'great illusions' on the fact that the economic relations of the Powers had become so intricate that war between them was impossible. Mr. Norman Angel worked out this point with consummate skill and wonderful elaborateness, to show that the Powers in future would shrink from war, because a war between two economically developed nations—not to think of a European war—would be disastrous, not only to themselves but to the whole world. When questioned about the validity of his arguments, in the light of actualities at the beginning of last August, when the unthinkable had happened, Mr. Angel triumphantly pointed out the closing of the Stock Exchange, the extension of the Bank Holiday, the raising of the bank rate, and the proclamation of the Moratorium as conclusive evidence of the truth of the economic arguments he had advanced in favour of pacifism. Therefore we have to preface our study of the crisis in the monetary world by a few words on the international position of English Banking, and consequently that of London.

It need not be said that *gold* is the ultimate basis on which all the commercial life of the world is built. It is *the only* form of payment acceptable everywhere, and therefore all international transactions depend upon the ability to procure gold. As the metal itself cannot easily be had, the commercial genius of the English nation hit upon a wonderful system to which is due the enormous growth of the commercial life of the world. All important business is now done on credit, that is, a promise to pay gold on demand. Bills, drafts, cheques, notes, and other credit instruments depend for their value on their immediate convertibility into gold.

London is the only place in the world where these instruments can be turned into gold without either question or delay. Hence it is clear that London is the Centre and Capital of the monetary world, in the same sense as it is the political Capital of the British Empire. It gives gold to all the other countries and thus finances big enterprises all over the world. It is the world's banker, and never once has its position been questioned. How, then, is it that the Bank of England had to raise its rate from 3 per cent on July 29th to 10 per cent on August 1st? How is it that the London Stock Exchange had to close? And why

is it that the unheard of financial instrument, the moratorium, was brought down from the armoury?

Before attempting to deal with these points, it is necessary, for the sake of clearness, to point out one very important fact. We saw that the credit instruments in general use in the monetary world depend for their value on their convertibility into gold. It is clear, therefore, that London, being the world's market for gold, must keep in stock a very great amount of cash to meet the demands on it. But the English system, as is well known, is based on very small gold reserves. All the "cash" deposits of the big banks are with the Bank of England, which holds them, to a large extent, as its own notes. It must be remembered that Bank of England notes, though legal tender to any amount, are only credit instruments, and not bullion tickets, because of the "fiduciary" nature of their issue. They are issued against Government security, and not against gold, up to £18,450,000. Therefore, under certain conditions, Bank of England notes themselves would not do for international transactions.

In ordinary times those notes are, for all practical purposes, equal to bullion certificates. The inadequacy of cash reserves will not in the least matter, for London can at any time draw in any amount of gold, by simply raising its discount rates. The unquestioned predominance of London was in itself the reserve for all calls on her gold. It was hoped that if a crisis arose, London had only to beckon to other monetary centres to fill its vaults with coins. City editors optimistically prophesied London's ability to meet any situation.

The Austrian ultimatum to Serbia, on July 25, came to the monetary world as a bolt from the blue. The people of all countries had been for a long time fearing a European rupture, but the quickness with which it overtook the world surprised even the cool-headed men who control "the City." It was pretty clear from the beginning that the small spark lighted at Serajevo was going to spread a conflagration and would possibly consume the whole world.

Banking is an economic experiment performed on the psychology of the crowd. The fear of war—the fear of a plunge into the future, to be settled by the God of

Cannon and Ammunition—upsets the whole state of mind which the banker takes for granted. Every one rushes for gold and accepts nothing but gold; cheques become of no value, because no one will accept them; the position of the banks themselves becomes a matter of question, and depositors begin to withdraw their money and hoard it up in family chests. Such a change in the minds of the people is in itself sufficient to shake the soundest and best-managed money market.

Such an extraordinary run on the banks caused them to call in their money lent to bill-brokers and other Stock Exchange dealers, whose usual custom is to pay into one bank by borrowing from another. As the crisis was universal, they had to declare their inability to pay, for the money which they had borrowed was already in the shape of bills, which, as is clear, were of no use. From the time of the Austrian ultimatum the Stock Exchange had begun to suffer: sales from abroad poured in to London; all foreign stock fell tremendously; and the securities which London banks had held against them became unsaleable and hence of no value. The Stock Exchange had therefore to close.

Thus the "collateral securities" of the banks—which consist of stocks, and which in ordinary crises could be realised in gold—became useless. The only reserve on which they could depend was the cash deposited in the Bank of England. But, as we have seen, the Bank of England does not itself hold gold for its notes up to £18,450,000, and hence the matter became extremely critical. This raised the "run" into a wild panic, and extraordinary measures were found necessary to cope with the situation.

There is generally a very great demand for gold at the end of July, for holiday purposes, and this, together with the general state of mental confusion, caused an enormous run on the Bank of England. The refusal of some country banks to pay gold instead of paper increased it. The Bank of England found itself handicapped by the Bank Charter Act, which had laid down that for every note issued over £18,450,000 the bank must keep coin or bullion in its vaults. Recognising its inability to comply with these conditions, the Bank of England applied to the Treasury (then under Mr. Lloyd George) to suspend the operation of the Act. The Treas-

ury pointed out that the Act had never been suspended when the bank rate stood below 10 per cent; and thus the Bank of England was forced to raise its rate from 3 per cent to 10 per cent in three days. It was a very clumsy operation—one that destroyed the prestige of the London money market before the world.

The Bank Act was then suspended, that is, the Bank of England was allowed to issue notes, on Government guarantee, over £18,450,000, without having gold in coin or bullion behind it. But after the suspension the Government took in hand the provision of new currency and began to issue Treasury notes, thus making the suspension of the Bank Act and the clumsy raising of rate that preceded it entirely meaningless.

On August 6th the Government extended the partial moratorium which it had already issued on August 3rd, and safeguarded the position of the banks till arrangements for a new currency were made. The moratorium, as everybody now knows, is an instrument by which all payment of debts contracted within a specified time is postponed till a specified date. We have seen how some such arrangement was forced on the City by a variety of causes which were on the whole unforeseen. Perhaps its declaration was in itself a confession of inability, and, coming as it did to support the strongest money-market, must have caused a good deal of surprise outside the circle of experts who knew the intricacies of the exchange machine.

Looking now from a distance, after the tornado in the market has to a certain extent passed away, we can without much difficulty see the causes that led to it. When London became aware of the demands made upon her, she naturally called upon her debtors (and all the world except Paris owed her money) to pay up their debts. The exchange was in favour of Paris, and New York found that she could pay London only by drafts on London—which was evidently a move in a vicious circle. Thus London was unable to realise the money she had advanced against securities; and the securities themselves, because of the defection of the exchange, were unsaleable and hence of no use in strengthening the position of the banks against demands on them. Thus London was thrown back on her own reserves—on

the gold within her own vaults. Moreover London had to ship gold to Paris, because the exchange, as we have said before, was in favour of the latter. Thus we see that the edifice of the money market broke down completely under the weight of such an unthought-of pressure.

The situation was unexpected, and in the bewilderment caused by the shock of the crisis the banking community—a community characterised by extreme sanity and cool-headedness—lost their balance for the time. The result was the muddle-headed proceedings which we have noted before. In the meantime the gold that the Secretary of State for India holds at the Bank of England was transferred, and South Africa, Canada, and the United States sent all the gold they could collect. The financial expert of the "Times" calculated the amount imported to be 52½ millions.

The crisis, however, did not affect Berlin in such a serious way. It remains one of the many surprises of the war that German bankers avoided a moratorium and kept the exchange open. The wonder is greater when we consider that English financial experts used to assert that if Germany wanted to fight England, it could be done only if London furnished the money. This has proved to be more illusory than any other expectations connected with the war. Not only was Germany able to conduct the war, finance Turkey, and advance money to Bulgaria, but also to avoid all the confusion that "the City" experienced. The fact cannot now be explained in any satisfactory manner: we have to wait till the war is over to study the preparation that Germany made to stand the crisis. But we have to acknowledge this, that, with little or no help from outside, German bankers were able to preserve their financial system from breaking down.

London soon found her feet, and the City soon came back to conditions as normal as is possible during these abnormal times. It is perhaps profitable to consider what results it will have permanently on the position of London and the money market as a whole.

Before the crisis financial experts amused themselves by speculating on the possible conditions that would arise in case of a European war. When the crisis actually came they were surprised to find

that all their calculations were as far as possible from the truth. It is still more difficult to say with any amount of certainty what permanent results this war will leave in "the City." Most of them, of course, depend for their seriousness chiefly on the length of the war. However, we will try to enumerate some of the possible results which the City will have to face when peace is again restored to the world.

There is, first of all, a great diminution of wealth. This is negative as well as positive. Negatively the nation will suffer from the loss of the wealth which might have been accumulated. This may seem an unimportant consideration, but remember that a great majority of the English bourgeoisie depend for their incomes on some sort of investment in foreign lands, we shall have to recognise a great loss of wealth in that way.

Positively, finance will suffer in two very important ways:

(1) There will be a great amount of foreign indebtedness, due either to monetary help derived from other Powers (such as the subscription of the British War Loan in New York, etc.), and indebtedness incurred by placing big contracts with foreign firms. On the latter point we have to bear in mind the great amount of ammunition and other things for war supplied by the United States to the British Government. It is said that Great Britain and the Allies have placed an order of £300,000,000 for munitions in America. After the war, therefore, London will have to pay all this debt back, which means that for a long time after the war the exchange will be moving against London, in favour of New York.

(2) Then, again, we must remember that England and France are less self-supporting than the Central Empires. England has to import all her food from foreign countries. This will show itself in an enormous amount of foreign indebtedness after the war. England, for example, has to import wheat from the Argentine and U.S.A.; cotton from Egypt and America; and various other things from various parts of the world. In ordinary times these things are paid back by goods and services, and as this is impossible during war-time, it is clear that there will be great outstanding liabilities after the war.

Add to this, the chances that New York is standing to take the place of London in the international money market. We have seen that when the banking world settles down after the conclusion of peace, New York will be in a position of vantage in every respect. It will undoubtedly be a great credit market, and if the Federal Government removes the difficulties under

which New York banking is now labouring, we have to face seriously the problem of New York taking the position of London.

After this was written comes the news of the fall in the sterling exchange in New-York. The news has caused considerable alarm in the monetary world on both sides of the Atlantic.

PAPER-PULP FROM THE BAMBOO

D. STRICTUS BAMBOO OF THE DANGS.

By DHIRVA SUMANAS, *Paper Pulp Expert.*

TO put the industry of paper-making in India on a proper footing, the Government of India has been investigating for the fibrous materials suitable for production of paper-pulp for the last 50 years and over. Complimentary to *Ischæmum Angustifolium* and *Saccharum Munja*, the chief paper-making materials which are not obtainable in large quantities on a remunerative scale, *Bambusa* has been found out to be the proper material for the manufacture of paper-pulp and no fibre available in quantity at the present moment can be superior to bamboo. It received special attention since 1905, when the Government of Burma invited Mr. R. W. Sindall F.C.S. (London), a paper-pulp expert, to make an inquiry into the possibility of manufacturing paper-pulp from bamboo growing in Burma. In 1906, his report was published, followed by a booklet printed on paper made from bamboo, in 1909. Interesting experiments on the subject were made by Mr. W. Raitt, F.C.S., the cellulose expert attached to the Forest Research Institute at Dehra Dun, and the results of his labours are chiefly embodied in his valuable Report on the Investigation of Bamboo as Material for Production of Paper-pulp, in the Indian Forest Records Vol. 3, pt. 3; followed by Vol. IV. pt. V., containing information about the bamboo-forest areas and the results of several tests carried on in the Titaghur Mills.

In January 1914, the Government of Bansda State requested me to visit Bansda

for the purpose of investigating into the possibility of utilizing bamboos growing in their forests, as a suitable raw material for making paper-pulp and to determine if the industry could be established there successfully.

The Dangs forests are situated in the Northern circle of the Bombay Presidency and are surrounded principally by the boundaries of Baroda, Bansda, Dharampore and Sulgana States and Nasik and Khandesh collectorates.

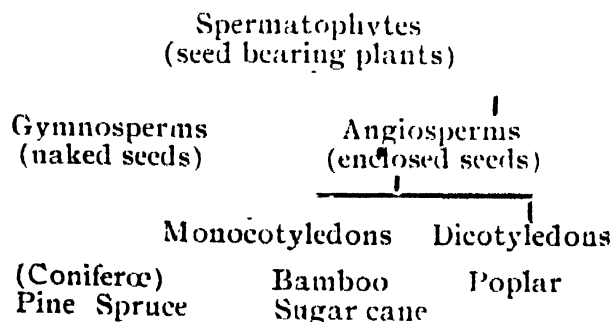

The principal variety of bamboo growing in is *Dendrocalamus Strictus*. This is the most common, most widespread and most universally used of all Indian bamboos. It is deciduous, densely tufted, gregarious, and has strong often solid culms which average from 20 to 40 feet high and 4.5 to 5.5 inches in girth, weighing nearly 6 to 10 lbs. It flowers about every 30 years and is reproduced by seed. A forest of surprising splendour is transformed into one of desolation and death, soon followed by fire, until the charred stems, dust and ashes are all that remain. The seeds which somewhat resemble wheat are edible and have a high food value after the removal of the husk. The leaves are very largely employed as food for buffaloes and elephants.

Here it is not necessary to enter at any length into the question of suitability of bamboo-fibre for the manufacture of paper. This has been fully demonstrated by previous experimentists. Every one who has

handled the material has agreed that it is admirably adapted for the purpose of and especially so for high class printing and illustration work requiring a close even texture and surface, and a minimum of stretch and shrinkage under the damping operation. Again it makes into any kind of paper by itself and does not require blending with other fibres. The one serious objection hitherto advanced against it was the cost of bleaching. With the soda process, this difficulty is almost removed. The quantity of bleach required now is not 9 to 40 per cent., but is nearly 5 to 10 per cent., only. Esparto boiled with 15 to 18 per cent. soda requires 5 to 10 per cent. bleach according to the standard of whiteness of the paper required. Now it can be said that bamboo is treated quite similarly as is esparto, except that bamboo requires a higher temperature though lower than what is needed in boiling wood. Thus it can be seen that the bleaching expenditure has been considerably brought down to a figure which compares very favourably with esparto or any of the raw materials now in use.

The serious and special difficulties hitherto experienced with bamboo, viz., irreducible nodes, irregular yields, irregular digestion of mixed ages and high cost of bleaching can all be overcome by splitting, crushing and shredding and further by treating the substance by the alkali process under varying conditions of time, temperature and liquor.

Wood Pulp is a comparatively modern product called into existence as a paper maker's raw material. Of the four great groups of modern botanical classification the spermatophytes are the most conspicuous and widely distributed. Again, the trees which furnish wood pulp are of two sub-groups.

The ordinary flowering plant as a complex structure is an assemblage of units

known as cells and its work as a plant is to grow, to build up tissue. Variations and differentiations of the typical forms of cells correspond with infinite diversity of functions and conditions. More extreme variations in the form of cellular tissues lead to the structural forms classed as fibres and vessels. Fibres are the strengthening elements of plant substance and are of relatively simple form. Vessels are the seat of complex vital functions and operations involved in nutrition, and are much more diversified in form. The monocotyledonous stem is composed essentially of a ground tissue known as parenchyma made up of thin naked cells showing equality in their dimensions, though occasionally elongated and scattered but closed fibro-vascular bundles, i.e., with no connecting combium. This arrangement implies an absence of provision for large increase of diameter, and the stem of a perennial of this type is columnar or cylindrical. The vascular bundles generally develop seterome tissue, i.e., sclerenchymatous thick-walled fibres which in association with the vessels, contribute the fibres and vascular bundles. In bamboos and canes they run parallel to each other up the internodes.

In structure, bamboo presents several features which markedly differentiate it from any of the raw materials now in use. It is porous, thereby differing from coniferous woods; its pores run vertically in close, straight and regular series throughout their whole length, which in the green culm are filled with sap, and in the dry with air. Dry bamboo is therefore largely impregnated with air in a state of capillarity, a condition rendering its expulsion difficult. Drying and seasoning does not cause a collapse or flattening of these pores by shrinkage as is the case to a considerable extent in the rice straw. In bamboo they retain their shape and size and therefore their air-holding capacity, and no other material in common use carries so large a quantity of imprisoned air. Therefore in addition to the mass and colloidal resistance common to all materials, we have in bamboo a resisting force peculiar to itself, since complete penetration of the tissues by the chemical solvent cannot take place until the whole of this capillary air has been ejected. When means are not adopted to force the whole contents of the digesters by screens in

stationary ones, the last chips to sink have been found badly digested, not only because they get two hours' less treatment than the bulk of the contents but because they fall into a liquor already weakened by two hours' previous work,—and even when the whole contents are brought under liquor from the start there is found some irregularity in result between the outer and inner tissues of the chips unless the liquor of greater strength is used than would be necessary if rapid penetration were secured, so as to ensure it still being of sufficient strength when the interior of the chip is ultimately reached. This irregularity in digestion is removed by using rotary digesters instead of stationary ones.

Bamboo has little mass resistance to the action of solvents in comparison with other impervious hard woods in spite of its high specific gravity. Bamboo is a hard and heavy material but is strongly resistant to mechanical force in the transverse direction only. To a splitting or crushing force acting longitudinally, it has scarcely any resistance whatever and it is possible by careful dissection to isolate individual fibre-bundles, and to follow them up along the nodes and through the internodes for the whole length of the culm.

The monocotyledonous fibre-aggregates, whether fibro-vascular bundles (*Alx* fibres, *Musa*, &c.) or entire plants (*Esparto*, *Bamboo*, *Sugarcane*, *Straw*,) are largely made up of pectocelluloses. The general characteristics of the pecto-celluloses are that they are resolved by boiling with dilute alkaline solution into cellulose (insoluble) and soluble derivatives of the non-cellulose (pectin, pectic acid, and metapectic acid): they are gelatinised under the alkaline treatment; they are "saturated compounds" not reacting with the halogens, nor containing any groups immediately allied to the aromatic series; and are colloidal forms of the carbohydrates, or closely allied derivatives of lower molecular weight, and belonging to the series of 'pectic' compounds or hexoses, &c. Pectose is of a gelatinous nature, lignin being more like resin, and like glue and resin, the first effect of solvent action is with both to produce a partially dissolved waterproof colloidal film which protects the tissues it encloses from the further action of the solvent. The influences which overcome this resistance are strong liquors, high temperatures, and prolonged duration, of digestion each being

within certain limits complimentary to the others and capable of being substituted for each other. Ligno-celluloses, such as spruce, contain much lignin but no pectose, while pecto-celluloses such as the smaller fibrous grasses have a large quantity of pectose and little or no lignin. Bamboo contains both in considerable amount, and its resistance from this cause alone is equal to that of spruce, while its total resistance from mass, colloids, and capillary air is greater than spruce. The pectose is readily soluble in boiling NaOH solutions, but gelatinises at the higher temperatures employed in digestion and is therefore liable to become mechanically bound to the cellulose and difficult to wash out in the case of material treated in chip form. When this occurs, the difficulty of the subsequent bleaching is considerably increased. The smaller the particle, the less will this mechanical binding occur in the interior, hence the advantage of crushed material is very marked upon this point. With pectose, fat and wax may conveniently be grouped, as the latter is insignificant in amount and is soluble under similar conditions. Together they neutralise or abstract from the digestion liquor 32 per cent. of NaOH on the raw material for each 1 per cent. found on analysis. Unlike pectose, lignin is not soluble in weak solutions nor at temperatures below 130° and with strong solutions and high temperatures the danger of serious hydrolysis and destruction of fibre comes into play. The weaker the solution and the lower the temperature, the higher the cellulose yield, but the minimum limit with both is the point at which lignin is no longer soluble. Its resolution is essentially a process of saponification and it must be borne in mind that it has to be transformed into a soap which remains soluble in the cold, otherwise precipitation on the pulp would occur during the subsequent washing. Crushing entirely eliminates the two difficulties peculiar to bamboo, viz., its capillary air and also very largely reduces its colloidal resistance. With their colloidal and air resistance gone, their additional pectries and ligneous contents sink into insignificance in relation to the whole mass. But the crushed material, by its large bulk, entails the use of a large volume of comparatively weak liquor, and this, to a considerable extent eliminates the hydrolysing tendency of strong liquor. In general the digestion

liquor will not exceed 12°. In liquors of this strength, the lowest temperature at which the permanently soluble saponification of the lignin can be effected is 150° and the consumption of NaOH is equal to 66 per cent. on the raw material for each 1 per cent. found on analysis. The duration of digestion required is three hours. Estimating on the analysis Mr. Raitt has shown that 17.58 per cent. NaOH on air-dry bamboo is the irreducible minima with which bare but complete resolution can be accomplished under nearly perfect conditions of resistance. Anything in excess of these amounts which may be found necessary will be due to conditions of material or digestion other than the non-cellulose contents of the material.

The processes of pulping are of two kinds: (1) a simple disintegration by wet or hot grinding to a "mechanical" pulp. Such pulps are substantially the original wood substance, deprived incidentally of water soluble constituents; (2) chemical processes which attack the ligneous constituents and convert them into soluble derivatives, leaving the cellulose which preserves the form and dimensions of the original fibres constituting a "chemical" pulp composed of the fibrous structural elements of the wood in the fully resolved condition.

Out of these two processes of pulping, bamboo is subject only to the chemical process; and such methods employed are of two kinds, viz., acid, of which the so-called "sulphite" process is typical; and the alkaline, exemplified by the well-known "soda" process. Whichever system is used the preliminary operations for preparing the bamboo are the same. The stems of bamboo are crushed and flattened under rollers and these are afterwards cut into chips and shredded into fine shavings. The unsuitability of the acid treatment has been finally determined by previous experimentists, in spite of its possessing certain advantages along with the cheapness in cost. Sulphite process exercises a less destructive effect on the fibre, so its yield of cellulose is slightly higher and it does not degrade the solubles of the material to a brown colour which stains the pulp. The material therefore is of a fairly good yellowish white colour in the unbleached state and can be used for many purposes (such as the cheaper grades of newspaper) without further bleaching. But this advantage is

largely lost where better grades are concerned which entail bleaching to a white shade, for it is frequently the case that the brown soda pulp is more easily bleachable than the pale yellow sulphite. So it is not suitable unless a market exists for the pulp in its yellow unbleached condition. But the bamboo pulp is so emphatically suitable for better uses that it would be misplacing it entirely to devote it to purposes for which an unbleached yellow cellulose is good enough, and the cost of bleaching bamboo sulphite pulp is so much greater than for bamboo soda that any economy of sulphite over soda is lost.

The alkaline treatment of bamboo for the manufacture of soda bamboo-pulp is similar to that used for the manufacture of esparto-pulp. The crushed bamboo in the form of fine shreds is heated in large rotary digesters with a solution of caustic soda. The non-fibrous constituents of the wood are completely dissolved, and a brown coloured pulp is obtained. The spent liquors are preserved and the soda recovered to be used over again as required. All kinds of wood and other fibrous materials may be converted into pulp by this process. Caustic soda combines with the acid products derived from the non-fibrous constituents of the wood until the alkali is neutralised, so that the insoluble portion of the wood left is cellulose in a more or less pure condition, containing much less resin than the pulp obtained by the sulphite process.

It has been said before that for digestion of material which has had its mass, air and colloidal resistance almost entirely destroyed and from which the starchy contents have been extracted, a temperature of 150° is essential for at least 3 hours, with consumption of NaOH 17.58 per cent. on the crushed bamboo. The condition of treatment vary according to the nature of the material and the requirements of the manufacturer. For pulp that will bleach readily the process of digestion is carried out to a greater extent than for pulp which is required in the manufacture of wrapping papers. The yield of pulp and the quality are influenced by these conditions. The increase of pressure results in a diminution of yield, the quantity of pulp obtained being reduced considerably. The excess of Alkali causes rapid destruction of the fibres. With lower pressure the resulting pulp though

higher in yield requires a greater quantity of B.P. Saving of time also is a most important factor in the economic conditions governing modern factory practice. The fixed charges increased by a factory for interest and depreciation of plant, salaries, wages, &c., bear so high a proportion to the total cost of pulp per ton that the quantity of output becomes a question of supreme importance. The greater the production the less the ton cost for these items, and it may easily be of so much importance that it may pay to sacrifice chemicals, or even yield, in order to save time and thus increase the output. The problem therefore is to arrive at those conditions which most economically balance the two.

Instead of giving all the details of the long series of my experiments which were made to obtain results to compare with the results obtained by Mr. Ratt, in con-

nection with the other five species he treated, it would be desirable to give the final conclusion drawn from the series of my experiments with the *Dendrocalamus Strictus Bamboo*.

And that conclusion is that *D. Strictus* bamboo of the Dangs requires a treatment less severe than any of the other varieties of bamboo, bleaches more economically, and costs less. It is quite safe now to say that any kind of bamboo can be treated without difficulty to produce pulp of the highest quality and that no fibre available in quantity at the present moment can be superior to bamboo. It is suitable for the highest qualities of paper, and when properly treated, can also be converted into excellent kraft paper. As a matter of fact when properly handled, bamboo can be used for practically anything for which cellulose is suitable.

THE STRUGGLE

By J. J. BELL, AUTHOR OF "THOU FOOL," "A KINGDOM OF DREAMS," &c.

[All Rights Reserved.]

"**T**ALKING of conscription," the handsome, white haired guest remarked, helping himself to a walnut, "just as I was leaving the club to-night I heard that General Farrar, one of its most strenuous advocates, had died suddenly this afternoon."

"General Farrar!" exclaimed the young host, and simultaneously a cry came from the hostess.

"Dear me! Pray forgive me." The guest looked apologetically from one to the other. "I was not aware that the general was a friend——"

"Oh, that's all right, Sir Philip," the host hastened to say reassuringly. "We know the general only by name, though we happen to have the acquaintance of some of his relations, the Stanfords. Do you know them?"

The question seemed to miss Sir Philip's

ears; his attention was all for his hostess. "Mrs. Lennard, I fear I have upset you," he was murmuring self-reproachfully.

"Oh, no not really, Sir Philip. I can't think why I should have been startled——"

"Why, Hilda," said her husband, "you look as if you had seen a ghost!"

"Nonsense, Frank!" She laughed almost easily. Her colour was already coming back.

"I'm afraid you are developing those nerves again," he said smiling, albeit anxiety lingered in his eyes. "Just as well, perhaps, that we no longer need to go out to-morrow." He turned to his guest, remarking: "Mrs. Stanford was to have given a dance in the Ritz to-morrow evening."

"Ah!" said Sir Philip, his eyes still on his hostess.

And the truth is," said Hilda, with another uncertain laugh, "I'm frightfully

disappointed. Am I not heartless person, Sir Philip?"

"I should not have a thought so," the old man replied, "trifle drily. "You are fond of dancing, Mrs. Lennard?"

"Well, this was to have been a special affair," put in Lennard, who was obviously puzzled by his wife's manner. "Apart from the dance itself, Hilda and I were going to regard it as a sort of celebration of the anniversary of our wedding——"

"We shall have been married five whole years," Hilda interrupted as one who feels speech absolutely necessary. "What shall we do by way of celebration now, Frank?"

"What do you say to a quiet evening at home, Hilda?" It was a serious question lightly put.

"How horrid!" She pouted. "Of course, I didn't mean that, dear, but surely we ought to celebrate such an occasion in festive fashion. Don't you agree with me, Sir Philip?" Her smile was charming.

"I am afraid I must ask you to permit me to agree with your husband's suggestion," Sir Philip answered with gentle gravity. "A quiet evening together seems to me a real celebration after five gay and happy years." He raised his glass. "My dear Mr. and Mrs. Lennard, I drink to you both. May your future be as happy as your past, and—if possible—happier." Once more his gaze lingered on the young woman, and suddenly she flushed to her dark hair.

"Thanks, Sir Philip; thanks from us both." Lennard tried to speak brightly, but he was feeling dissatisfied, irritated; he could not have told why. Until five minutes ago he had been in the best of spirits, and the informal little dinner had gone merrily, as their little dinners had always gone with Sir Philip as a guest. Was the old man to blame? Nonsense! How should the announcement of an unknown person's death that involved no more than the cancellation of a dance upset his wife? Hilda had shown similar signs in the past; during the last two years she had suffered from brief attacks of nervousness, especially before and after big entertainments. She must really see a doctor this time.

Hilda broke the short but somewhat strained silence. "Shall we have coffee in the billiard room or in the library?" she asked, pressing the electric button beside her plate.

"Let's have it in the Library, Hilda. Percival is coming in for a game, but before he arrives I want to show Sir Philip your necklace."

"My necklace!"

"Why, yes, Hilda. I brought it from the bank to-day, because I thought you would want it for the Stanfords' dance." He paused to allow of her giving the order to the man who had entered and was standing attentive at the door.

"Yes, yes, of course. I—I expected you would bring it from the bank." She appeared to be unaware of the servant's presence: "I suppose you have left it in your safe in the library. Do you think Sir Philip would really care to see it, Frank?"

"My dear, Briggs is there."

"Oh! . . . Briggs, we shall take coffee in the—the billiard-room."

"Yes, ma'am." The servant bowed and retired. Sir Philip, who had given him more than one casual glance, made a slight grimace.

"I thought it was to be the library." Lennard was looking at his wife. She was pale again; her fingers toyed restlessly with a wine-glass. His heart smote him. He had been allowing her to overdo it. "All right, dear," he said kindly; "the billiard-room will do excellently. We should have been going there in any case on Percival's arrival. Meanwhile I'll take Sir Philip to the library and show him the necklace. He is a judge of diamonds, and I want his opinion."

"Delighted!" said Sir Philip. It seemed almost as if he had turned his back on his hostess. "You are speaking, I presume, of the necklace you gave your wife just after you were married. You have more than once promised to show it me."

Mrs. Lennard rose. "Don't wait for me, she said, her hand on the back of her chair. "I'll follow you immediately."

"Hilda," said her husband, "you are feeling fit enough?"

She contrived a semblance of a smile. "Perfectly. A little tired, perhaps. Nothing serious, I assure you."

Lennard hesitated, then left the room with the guest.

Hilda's grip on the chair tightened; her body relaxed and drooped. "Oh, my God," she whispered, "help me to do something, quickly."

When she reached the library her husband was stooping behind the open door

of the safe. Her ears informed her that he was fitting a key into a drawer. Sir Philip was standing by the hearth, and to him she went directly. She was now very pale.

Aloud she said: "I shall wait for you in the billiard-room, Frank." In scarce a whisper: "Read it now."

She turned and went, leaving in her guest's hand a narrow slip of paper.

There was the sound of a steel drawer sliding open. Sir Philip scanned the hurriedly penciled words:

"For God's sake, pretend you think the stones are real."

II.

About ten o'clock she excused herself to her guests on the plea of feeling the billiard-room too warm.

"I will write to Mrs. Stanford and then go to bed," she told her husband, who was "making" for the others.

"Go to bed, dear, and leave everything else till the morning," he said tenderly. "And perhaps we shall do something moderately festive to-morrow, after all. In the afternoon, we'll have a look at the jewellers' shops. You want a new ring."

"Oh, no, no!"

He laughed. "And then I've decided to have the necklace reset—Sir Philip thinks the stones don't get their proper chance; so——"

"Seven to go, old man," interrupted Percival.

"All right. . . What! are you off, Hilda?"

"Yes. Good-night, all," she managed to say from the doorway, her hand pressed hard to her heart.

* * * * *

Ten minutes later Sir Philip found her in the library, cowering over the fire, though May was near its end.

"Frank is playing a hundred, with Mr. Percival," he remarked, seating himself on the other side of the hearth. "Like you, I found the atmosphere of the billiard-room a little oppressive."

She did not respond, save with a glance, and the misery in her eyes shocked him.

"Mrs. Lennard," he said softly.

"Well?" she whispered at last.

He took a bit of paper—a narrow slip—from his waistcoat pocket and gave it deliberately to the fire. "My dear," he said gently, "to-night I have lied to your husband, whom I have known and loved since

he was a little boy. His mother was the lady I would fain have married. I remember her when she was a girl like you—very like you. I think it was partly for her sake that I did what your note asked me to do."

Hilda put a hand to her head. "I thank you," she said: "I am very grateful. . . But, oh! why did you advise him to have a new setting? Now I am ruined—utterly ruined. To-morrow he will take it to the jeweller, and then—Well, I suppose I ought not to have expected you to think of everything, Sir Philip."

"I tried to think of everything, Mrs. Lennard. Can't you guess why I suggested resetting the stones?"

She started. "Surely—surely you did not want to betray me?"

"No; to save you. My motive was simply to force your hand."

"To force my hand!"

"In other words, to compel you to tell your husband everything."

"Oh, never! How cruel!" She covered her face.

"My poor child," he said in a low voice, "there is no other hope for you. I'm an old man, and I know. You must tell him everything."

"He would detest me!"

"Ah, no! I beg you to believe me when I say that he would neither hate nor despise you. I would ask you to believe also that it would be easier for me to give you a blank cheque than this advice——"

"A blank cheque?"

"Yes. I'm surely an old enough friend to be permitted to do that. A cheque with which to redeem the real necklace—so that you might, in some sly and underhand fashion, substitute it for the false."

"Stop! Sir Philip, you don't understand—of course, you can't understand. I—I have the real necklace——" Involuntarily she raised her voice.

"Sh!" Sir Philip, holding up a hand for silence, rose and tiptoed to the door, which he opened softly, suddenly. Closing it he nodded. "All right. But I don't like your man-servant, Mrs. Lennard. Has he been long in your service?"

"Only a month. Why—" She uncovered her face.

"I may be wrong. I'm an old man, and old men have fancies." He came back to the hearth and seated himself. "You have

the real necklace— Where?" he asked gently.

"In my room, upstairs."

There was a silence for some seconds. Then Sir Philip said: "Do you wish to tell me more?"

"I will tell you everything."

He sighed. "That is what you must tell Frank."

Her head drooped. "I am hoping that when you have heard everything you will no longer think it necessary for me to—to kill Frank's love."

He shook his handsome white head, smiling faintly. "Oh, thou of little faith! But tell me what you will, my dear."

Presently, with lowered gaze, she began to speak. "I suppose you have guessed that it started with cards—bridge. But it was bridge in the afternoons. Women's parties. I think women are worse than men. I was. At first I didn't like playing for money. I don't think I ever played for money until I had been married for two years. And then—I didn't know where to stop. At the end of one year I was deeply in debt and—terrified." She paused for a moment. "At that time I kept the necklace with my other jewels. I didn't know its value. I don't know it now. But—"

"Seven thousand pounds." Sir Philip remarked quietly.

"Oh! I had no idea it was worth nearly so much. Well, when the debts were driving me crazy I—I decided to pawn the necklace. I had heard of people getting paste copies made of their valuable jewels, and a woman—the one I owed the most money to—showed me the way. The day after I got home with the false necklace there was a burglary in the neighbourhood. Frank insisted on keeping the necklace in future at the bank. I—I had to give him the false one, for the real one was already pawned. I paid all my debts—and I wasn't a bit happy."

"Poor thing!"

"But since then," she went on, "I have never played bridge. Since then I have scraped together every penny I could from my allowance—Frank is very generous—and all the interest on my own tiny little bit of money, and I have pretended to be awfully extravagant and frightfully charitable, when I've been really economical and mean. And yesterday I was able to get the real necklace back from pawn." Once

more she covered her face. "You think that was nothing?"

"My dear!" Sir Philip rose and stood looking down on her with infinite pity. "And then?"

"And after the Stanford's dance I was going to give back Frank the real necklace."

"And then?"

She dropped her hands and turned up a pale, indignant face.

He gave her no time to speak. "You have done a great thing, Hilda," he said, "but it cannot take the place of confession. I am thinking of you. Tell Frank, and he will forgive you. Tell him everything to-night."

"Oh, you are hard—hard! You have made it so that I must either tell him I have been a wicked little fool or be discovered as a wretched cheat."

"We have all been wicked and foolish.... Tell him to-night."

Suddenly she slipped to her knees before him. She caught his hand. "It—it would be so simple a thing for you to—to ask to see the necklace again, and exchange it for the real one."

"Ah!"

"It would be my salvation, Sir Philip. Could you not—"

"You do not know what you are saying, my dear," he said firmly. "If you actually saw a person deliberately deceiving your husband, you would want to kill that person. Is it not so?"

She let go his hand and rose slowly to her feet. "Then I had better kill myself." She took a few steps away from him and threw herself on a couch.

Sir Philip wiped his brow. "Mrs. Lennard, do you love your husband?"

"Have I not been saying as much ever since I told you my secret?"

He sighed. "I have heard a woman speak like that in a play," he said. "I'm an old man and old-fashioned. If I did what you suggest, I could never face Frank again. As it is, his eyes can shame me now. Oh, Hilda, Frank's wife, let this old fellow go on being as proud of you as he has been since that happy wedding day! Be brave, be brave, my dear. For Frank's sake, as well as your own. Make his future happiness and your own secure against any ugly whisper out of the past. Remember your secret is known to at least one woman." He moved to where she sat and laid a hand

on her shoulder, for now her head was bowed and her breath was coming sobbingly. "You will tell him to-night?" he said very softly.

It seemed that he had won.

"I will, I will!" she murmured.

"That is grand of you," he whispered, and took her hand and kissed it, and went from her presence with wet old eyes.

III.

"I will tell him everything!"

Lying in bed, Hilda heard midnight strike, and soon thereafter voices and the clang of the hall door. Mr. Percival had taken his departure.

"I will tell him everything!"

Voices again, nearer at hand. Her husband was conducting Sir Philip to his room. Then a door closed softly, and there was a long silence. Evidently her husband had gone downstairs again.

"I will tell him everything!"

But when at last Frank entered the room her eyes were shut, and she was lying very still. She was conscious of his looking down at her, but not of the infinite tenderness in his eyes. Presently he bent over her; she heard him sigh, felt the touch of his lips on her hair. As he moved away she nearly cried out. He passed into the adjoining room.

One o'clock. She thought she heard a sound on the stairs and listened; but all was quiet.

"I will tell him everything!" she repeated feverishly, staring at the nightlight; yet she lay still, and the seconds of another hour trod wearily past.

Suddenly the question smote her: What if she were to be taken ill—so ill that she could not tell him anything? What if she were to die?

She got up and slipped on her pretty dressing-gown. From its secret hiding-place—which an inquisitive infant would have discovered—she took the real necklace in its case. The door was not shut; to her cautious pressure it yielded soundlessly. She stole into her husband's room.

He was fast asleep. But she would go down on her knees at his bedside and waken him gently, and—tell him everything.

A feeling of weakness assailed her, and she sought support. Her hand fell on a ledge of the dressing-table. Her fingers touched something cold. Her ears caught

the faintest of faint metallic sounds. Her eyes dropped to the cause of it. A shiver passed through her body. In the dim light she stood staring downwards, as though fascinated.

A small bunch of keys.

* * * *

The tiny light that was wont to burn in the hall throughout the night may have served her as she descended the staircase and crossed to the library; yet a spy would have deemed her progress to be that of a sleep-walker. The door of the library swung silently before her; as silently it closed behind her. In the darkness her hand groped for the electric switches on the wall. A pause of hesitation ended in a click.

The bulbs on either side of the mantelpiece leapt into luminance. And the woman staggered.

"Sir Philip!" she gasped.

The old man was seated in an easy-chair in front of the dead fire.

"Ah," he remarked, rising, "it is you, Mrs. Lennard. I got it into my old head that your servant Briggs might come to-night and try the safe, which is not a particularly strong one. I warned your husband about Briggs, whom I am certain I have seen in less reputable service than the present, but I fear he did not take me seriously. However, I do not now think Briggs will attempt anything to-night. The lights will scare him off. Still, I would recommend you to part with him as soon as possible, unless you are satisfied that the whole thing is an old man's delusion. But"—he moved towards her—"permit me to retire, Mrs. Lennard. I fear I may be in the way."

She was leaning against the door, her eyes half closed. Possibly her mind did not grasp what he had been talking about.

"Do not be afraid," he said suavely. "Any attempt at burglary has been at least postponed. Will you allow me to pass, please?" He stood waiting, watching.

All at once her eyes opened wide, like the eyes of a hunted creature. Her strength seemed to fail, and the leather case and bunch of keys she had been holding to her bosom fell at her feet.

He stooped, picked them up, and offered them to her, saying: "It won't take you two minutes to open that safe, make the exchange, and close it again—"

"Oh, but you are killing me," she breathed. "I hate you!"

"—and those two minutes will poison all the hours of your life."

"How dare you meddle—"

"Perhaps because I am an old man who loves your husband—and you."

She moved aside from the door. "Oh, go!" she whispered. "I can bear no more. At first I thought you were right, but now—oh, I dare not risk losing Frank. Can't you understand that? And if I've got to suffer all my life—"

"My dear," he interrupted gently, "how much do you love your husband?"

She stared at him. "Can't you see that I love him above everything?" She spoke almost irritably.

"Then," he said calmly, "you cannot open that safe."

There was a silence while she took the keys from his hand, crossed the floor, and stooped before the steel door.

"I care nothing for honour or anything else so long as I keep his love," she muttered, choosing the key.

"Whose honour?" the old man softly asked. "Whose is the honour when you and he are one?"

"Oh!" It was as if he had struck her. She wavered and sank to her knees. Presently she began to sob. "Oh, God, I can't do it!"

"Poor child, poor child!" he sighed. "Of course you can't do it." But he waited for a little while ere he approached her.

She allowed him to lead her from the library, wherein he left the light burning, and upstairs, and to the door of her room.

"I am going to tell him now," she whispered.

"Wait till the morning," he murmured, in spite of himself, in spite of all that had

passed, for he was torn with pity for her.

She shook her head and passed from his sight.

* * * *

Her husband had not stirred since her last glimpse of him. She knelt by the bedside, clutching the necklace and seeking to summon the courage she still required to utter his name. She was in torment.

She sought to waken him by gazing at his closed eyes until her brain seemed about to fail her, and her head drooped against the edge of the pillow.

Time passed, and despite her mental agony she became conscious of a slight physical discomfort; something hard was pressing against her cheek. Involuntarily her free hand made inquiry.

She lifted her head. Her whole body stiffened, for her fingers recognised the case that held the false necklace.

The safety she had sought through two dreadful years was literally within her grasp; it offered itself; it awaited her acceptance. And her husband would never know; he was sleeping so soundly—so soundly.

But even as she glanced stealthily at his face an awful horror of herself seized her.

"Save me, Frank," she cried, and gripping his shoulder she shook him frantically.

In the dawn Lennard watched over his wife in her slumber of utter exhaustion. At last her breath was beginning to come naturally, a faint colour was gaining upon the pallor of her face, the shadows of suffering were passing away.

"Thank God," he said softly, and bent to kiss her.

Which may suggest, among other things, that Sir Philip had not meddled altogether unwisely.

"Like the star
That shines afar,
Without haste
And without rest,
Let each man wheel with steady sway
Round the task that rules the day,
And do his best."—Goethe.

WHEN a man is in that period of his life when he seriously considers it necessary to enter upon matrimony,

he has need to have his eyes wide open and to set his brains a-thinking, so that the great responsibilities and duties devolving on him as a family man may reveal themselves to him in their true colours and that the great moral obligations and responsibilities lying behind the outward glitter of married life may not be left unreckoned; for, the glory of manly character depends

upon the honest performance of an individual's duties in life.

Great and solemn are the duties of a family man, and his responsibilities and obligations towards his wife and children are of such a serious nature that it should well nigh stagger even the stoutest heart if he carefully pre-surveys them. Nevertheless, many a young man, with hardly any knowledge of the troubles and anxieties of married life, rushes in for wedlock with an avidity and thoughtlessness that is most astonishing.

Almost the first thing that a young man, about to enter upon married life, should consider about, is whether he has the means to keep a home and maintain a family. It is only after he has this assurance that he should consider the question of his choice of a partner in life. Unfortunately, several of our young men first make their choice of a partner; the necessity for a home, the wherewithal for the maintenance of a family are made subjects for later consideration. Domestic life can not have any charms with the lovely looks alone of a wife. There must be grist in the mill. She might sing all day, but her songs will be strained and lifeless; she might, out of love for her husband, smile and ring the house with her laughter, but her smiles and laughter will lack the mirth of contentment and peace of mind; and the poor thoughtless husband who dragged her life to share his misery will feel, in his inmost heart, a pang at the strained songs and the forced smiles. Instead of one struggling soul, there would be two and, perhaps, more in future years; and where happiness was expected, misery would sit enthroned. The neglect on the part of a young man to consider this important aspect of married life is not only a crime to his family but an offence to society in general; as by his thoughtless action he drags a young woman from the care and protection of her parents to share his misery, and introduces, by and by, into this sad lot a number of young people—the fruits of his marriage—who, for want of proper education and sufficient means, contract evil habits,—the general concomitants of an impoverished and miserable life—and retard the course of civilization.

Another equally important, if not far more serious, question that should engage the attention of young men is the choice

of a suitable partner in life. The success or failure of a married life hinges upon this all important question. This is the more-so in the case of those whose religion admits of no divorce, or, in other words, who have to take a wife "for life, for good," or for bad, until death do them part." The smallest want of prudence and forethought in the selection of a wife would land a young man in future years to untold miseries, troubles, and anxieties. Following the principle of Keats, that "a thing of beauty is a joy for ever," young men generally go in for good-looking damsels, forgetful, oftentimes, of the virtues in a woman, so necessary to make a home happy and peaceful. Beauty in a wife is, no doubt, a good thing; but it will be tarnished the next day after marriage, if it is not embellished by the good qualities necessary in a wife; for, "handsome is that handsome does" more than that handsome looks. Beauty would be an additional charm in a wife, if she has the necessary, or more important, good qualities. The lady, a young man selects, should be of an amiable nature. Amiability does not mean her tendency to flirt with you all day long, nor can it be gauged by her sweet words and winning ways. Amiability consists in obedience, honesty, and frankness, and a desire to please (morally) those with whom she comes in contact, whether it be her husband, her children or strangers. She must also be one who does not put a high premium on her own comforts and luxuries, but should be one who loves self-sacrifice and self-denial, not to speak of self-help. She must be pure and virtuous. Well has it been said that "purity of heart and mind elevates man"; how much more does this noble attribute do for a woman? It simply glorifies her. There can be no sight more consoling than that of a woman, pure in heart, presiding as the mistress of a home. Her purity of heart and mind would be the halo of grace that would shed its lustre on her husband, and cast its reflection on her sons and daughters. Her virtue would be to her husband, a crown richer than those on the heads of Kings. Her purity will be the firm rock on which the moral fabric of her offspring shall be raised. Her moral lustre will penetrate not alone the inmost recesses of her home, but even farther outside it, shedding a glory for several to profit by. What, if

she is ill-clad and undecorated with jewels? What if powders, perfumes and pomades have not done her the work of beguiling? The ancient artists painted Madonna, that paragon of womanly purity, in plain clothes and undecked hair, and still was the Virgin Mother shining in all the splendour of her heart.

To know that a young lady has these attributes which alone can make home happy, it is essential for a young man to know her intimately. If a close personal knowledge, which must, as far as possible, be resorted to, is not feasible, the young man is morally bound, at least by patient and diligent enquiries, to ascertain the ways and manners of his intended partner-in-life. Young men, unfortunately, fall in love with young maidens at first sight and promise marriage—nay, some foolish thick-headed young men would even decide their choice through proxys or, perhaps, a look at the young lady's photograph, not knowing whether it is a counterfeit.

A young man once went into an institution to find a mate. The Lady Director in charge of the Institution arraigned before him a number of women belonging to the Institution, and when he had surveyed them and they had dispersed, he told the Director that he had chosen No. 3. After the young man left, the Director asked the women to re-arrange themselves as they did in the presence of the young man, and she selected No. 3, but, unfortunately for our young man, from the *wrong* end. No words are needed to portray the young man's consternation when, after the marriage service was over, he lifted up the bridal veil for the bridal kiss, and discovered the serious blunder that was made in substituting a very elderly matron for a young blooming maiden whom he had hit upon.

Worse still would be the fate of a man or woman who, in the "wanted" columns of a newspaper advertises his or her virtues in order to secure a partner in life. If brides are selected without even the care usually bestowed in the purchase of commodities, without even, I may add, either the guide of an illustrated or descriptive catalogue, is there any wonder in the serious blunders of married life, and the never-ending troubles and vexations that result therefrom?

Educational attainments are certainly an accomplishment requisite in a young

lady about to enter upon married life. Education would enable her to rightly understand her responsibilities and obligations. It would furnish her with resources to mitigate her troubles by enabling her to view them in their proper lights and deal with them accordingly. It would be an inducement for her to educate her children and bring them up in the right course of life. It would enable her to assist her husband in his struggle for the moral and mental up-lifting of the members of his household. It would be a great factor in the explanation of differences of opinion between husband and wife and parents and children.

If young men, about to enter life as married men, will only remember that taking a wife means taking her for ever; that, unlike commodities, she cannot be exchanged, replaced, sold, or transferred; and if they will only look around them and take into careful account the several mistakes made by their neighbours and friends, and the irretrievable nature of such blunders and the deep misery into which unsuitable matches have landed such people, they will pause and think a hundred times over before leaping into matrimonial entanglements.

The happiness of the young man himself, the peace and comfort in his home, the moral and mental education of his children, the economic regulation of his expenditure, the godliness, orderliness and cleanliness of his house and its members,—in fact, the success or failure of every conceivable item and aspect of married life centres in the wife. She it is who is the internal master of the situation. Her head heart and hands work oracles of success. A good wife is the angel that harmonises every chord in the music of the home. Man toils all-day long, and brings home whatever he could to meet his household demands, and—be, it more or be it less—a capable woman, willing, self-sacrificing, and dutiful, will be able to show the very best results. Give a thousand rupees into the hands of a squandering, luxurious, easy-going, and indifferent wife; it will vanish in a couple of days and on the third day there will be nothing left but the seeds of trouble and discord. While a good wife is the best ornament in a family, a bad one is a curse and a ruination. Young men will do well to remember that by

making a bad or a wrong selection, not only do they court unhappiness and misery for themselves, but they also expose their children to the danger of receiving a bad training from her and imbibing her perverted ways. The children of such women, unless they come under other salutary influences, are apt to turn out to be bad characters, as they grow up.

Men have oftentimes a tendency to marry women who are more accomplished than themselves or who have large fortunes. In the former case they run the risk of becoming mere puppets in the hands of their superior wives, while, in the latter, the natural course would be for the man to become the hand-maid of the woman, who is sure to run the show with her money. Accomplishments and fortune in a wife are, no doubt, good things when she has sufficient good sense as not to become hare-brained on that account. A woman may be beautiful *par excellence*, she may be highly educated and well accomplished in the fine arts, she may be rich and respectfully connected; but if she is not pure and virtuous, if she lacks the sense of duty as wife and mother, and if her character is open to question, all her beauty, education and wealth counts for nothing. One had rather go to a girl in poverty and rags, with no other accomplishments than the purity of her heart and the virtuousness of her character,—for these are the angelic glories of womanhood. Their lustre will eclipse her other deficiencies.

As it is necessary for a young man to take all possible precautions and care in the selection of a wife, so is it incumbent on a young lady to see that her suitor comes forward for her hand after mature deliberation and after providing himself with a home and the means for the support of a family that would soon spring around them. If she ignores this grave consideration she indirectly connives with him at dragging poor innocents into misery. She should also be watchful of her suitor's habits and temperament; for a great deal of her happiness and the welfare of the children she may have later on will depend upon them. Her suitor should be one that is willing to work and provide for the family, and if he has wealth of his own, he should not have a tendency to squander it. Let the young lady also see that the man is not intemperate in his habits. A drunk-

ard is a bane not alone in a family but even to society in general. Women are generally weak in their powers of discrimination, and oftentimes prefer gallantry to sound intelligence, and fall victims to the style of young men's clothes, his cigarette cases, and his perfumes, in preference to real sound substance in other suitors. She should see that he is a true gentleman as contained in the following lines:—

"We see him as he moved,
How modest, kindly, all-accomplished, wise,
With what sublime repression of himself,
And in what limits and how tenderly ;
Not making his high place a lawless perch
Of winged ambitions, nor a vantage ground
For pleasure ; but thro' all this tract of year,
Wearing the white flower of a blameless life.

In an old number of an illustrated journal there was a picture of a lady seated in the centre of a garden-seat, with two suitors of the same age on either side of her. The one was a judge of high repute with his wig and cloak on. His broad and bulging forehead bespoke intelligence, wisdom, and learning and his clear countenance beamed with honesty, frankness and sobriety. The other was a soldier—a red-coat with a physiognomy indicating deficiency of intellect and lack of purpose, with his face flushed with the effects of wine. And yet, the wonder of the situation was that the young lady was smiling in ecstasy to the soldier, with her back against the judge. What an instructive picture for our young sisters to draw a moral from? But unfortunately for them, they very often draw in the great lottery of matrimony the blanks of the 'redcoats' and rarely, the prizes of the 'wigs'.

And again, a young lady often takes sooner to a "gas-pot" of a young man than to a really grave, quiet, and unpretentious but sound and substantial suitor. She presumes that the quiet and unpretentious young man is a dullard and in spite of several other necessary accomplishments he will not do well in society, much less for exhibition among her girl-friends, little knowing that a short while after her marriage, very few people would care to talk about her acquisition, and that, as years go on, a society man, if he has not other requisite acquisitions, would be a signal failure as a family head, and that she herself would begin to rue her choice. On the other hand, there have also been

several instances of very quiet-looking young men turning out real tyrants and demi-gods after marriage. They put on a sheep's clothing during their courting days, and once the nuptial knot is tied, they cast off their disguise and reveal themselves in their wolfish ferocity.

The choice of a husband or wife, therefore, is a matter beset with several difficulties; and as it is a question that affects one's whole future life and the welfare of the progeny, no man or woman would be justified in hastily drawing conclusions, and blindly selecting or accepting partners in life under the popular conviction that "marriages are made in heaven" and the parties are not, therefore, responsible for the folly, if any, in the choice of suitors. Whatever the popular opinion of this all-important institution may be, there can be little doubt, that if the parties are well-chosen and suitable to each other, and if there has been no precipitated hurry whereby details of each other's nature and character have been ignored, the union, in the majority of cases, would be happy. Let no man or woman, about to enter into the state of matrimony trifle with this all-absorbing and highly important question which would mean to two grown-up individuals happiness or misery, to a number of children a bright or a blighted future, and to society in general a satisfaction or a mortification.

When man and woman have made up their minds to be husband and wife, and when the irrevocable tie has bound them together for life, (of course, only such sects with whom the marriage bond is irrevocable is meant) it behoves each of them to make the best of their alliance. The man conscious of his responsibilities as husband, must ever have before his eyes the image of his dear wife, and work and economise for the sake of her whom, among all women in the world, he has chosen for his companion in life, his adviser in times of need, his nurse in sickness, and his comfort and help in old age. He should also bear in mind the undeniable fact that, being married, he will have children whom it will be his duty to maintain and bring up in the right path, making such provisions for their future career as may be necessary. He should lead a scrupulously upright life so that its noble traits may be reflected on his wife and children.

The wife also, as soon as she has settled

herself in her new home should assume her obligations as mistress of the household. Of course, by that she is not to boss over husband when he is at home, or her servants; on the other hand, it is her duty to love, honour and obey her husband who is none other than her friend and colleague, and rule her servants kindly yet firmly. It is also her duty to give good counsel and direction to her husband whenever needed; for well has it been said that the wife is primeminister, to her husband. It is equally her duty to manage her servants efficiently, displaying kindness towards them, when needed, and treating them not as beasts but as beings deserving of sympathy and compassion, in spite of their being placed under her in a subordinate and menial position. She should take pains to keep her home in cleanliness and order. She should have an eye on the several departments in her home. She should avoid incurring debts by regulating her expenditure, and should practise thrift and economy. She should endeavour to attain the maximum of comfort with the minimum of cost. Let her also remember that a cheerful countenance is a great consolation to her husband. Wives would do well to maintain this great asset in want and in plenty. Her face may be very pretty and bewitching, but if she suffers it to be clouded with moroseness, it would despirit her husband and, perhaps, annoy him. The disagreeable combination would certainly not be conducive to domestic felicity. Nothing pleases a tired man after his day's hard labour more than to see his wife cheerful and contented, and his home neat and tidy.

The equipment of a home should be on a scale directly proportional to the income of the family. Good taste in furnishing it, is necessary and would be pleasing to all; but all pleasure would be lost, if thoughtless extravagance is restored to for the purpose. Whether the young wife is brought to a palace or cottage, she can so arrange everything as to be pleasing to all. A lady of high repute has said that "cleanliness, plenty of air, neatness and quiet are indispensable in a well-ordered home. A dirty window, a stuffy atmosphere, a littered floor, noisy children, clattering servants, are enough to spoil the comfort of the most elegant house in the world."

Women, after giving birth to a couple of children, often put forward the plea of want of time to rectify the untidiness of their homes or the disorderliness of the children and servants: but in ninety cases out of a hundred it will be found that the real cause lies in the fact that such women are idle dolts, unwilling to spend a few minutes a day in this important direction.

Wives must also learn to have a great command over their tongues. Many a difference of opinion has ended in open quarrels and unseemly fights, because women did not realise the importance of bridling their tongues. George Eliot says "we are apt to be kinder to the brutes that love us than to the woman that love us. Is it because the brutes are dumb?" Wives should get an insight into their husband's nature and should know exactly when to speak and what to speak and more than all, when *not to speak*, for, in this tact will depend much of the peace in a family. Most effective lessons were taught by great men when they were silent.

Husband and wife must remember that they have to work conjointly for their domestic happiness. It is idle to expect the husband to work all day while the wife recklessly keeps on spending whatever he brings; it is equally idle to expect the wife to economise when the husband goes head-long into extravagance. One cannot expect the wife to keep home clean and tidy and the children in orderliness if the husband returns home every day the worse for liquor. One cannot expect the husband to work harder day by day and to deprive himself of his little luxuries for the sake of his children, if his wife's millinery and perfume bills run up to colossal figures. No, these divergent tactics of husband and wife will never run smoothly. They must end in want, disorder, dissatisfaction, and rupture in the family. Hand in hand, in work, in labour, in spending in saving, in management, and in every conceivable matter regarding the home, both husband and wife must go, in order to attain domestic felicity. Be they rich or poor, there is no deviation from this rigid path; and there cannot be.

After the first few months, and in some exceptional cases, few years, of marriage, when the delusive charm of married-life has passed away, troubles are likely to

follow. The honeymoon period and a few succeeding months are, as a rule, happily spent, but as days go on either the husband or the wife assumes towards the other an attitude quite different from what it had been up to that. It may be either due to difference of opinion, lack of interest in each other, or to that devil suspicion who has found one of them susceptible to his vagaries. This period is a turning point in married life, and if husband and wife do not use all their intelligence, prudence and tact at such a critical moment, one does not know when they would be needed at all. One false step taken at this period by either party may lead to trouble ever after. There should be a frankness in explaining differences of opinion so as to win the opposite party; there should be love mingled in all the explanations and actions; the woman should go back to her maiden days and behave towards her husband as if they were starting their courtship afresh; the man should likewise take the standpoint of his bachelor days and behave towards her as if he just began his suit to her, and would lose it if he did not acquit himself well. One of the worst evils that can enter the minds of married people is Suspicion. "Wrong thoughts are painful in their inception, painful in their growth, and painful in their fruition." faults or offences on either side should be fairly and squarely set before each other and corrected—not in a manner to wound the feelings of any party, but with the intention to heal the differences. There must be a certain amount of forgiveness from either side, especially when an amendment is promised. Young men, having some differences to settle, have often been known to pull off their coats and take to boxing in order to settle their disputes, and then regain their friendship after a cordial drink together. Quarrels in married life can rarely be settled in this manner. The pacification after the broil will never be complete; the additional offences committed in the brawl would rankle in the mind and assert themselves sooner or later. It is one of the worst things for a married couple to fight over any matter. It not only spoils the effect of the love and regard between them which ought to be everlasting, but it lowers each in the other's estimation besides lowering both

in the eyes of their children and servants and of the public who come to know about such misbehaviour. There are couples who take a delight, as it were, in fighting over the most trivial affair—even over the accidental breaking of a tea-pot or a sherry-glass. Constant quarrels in the house mar considerably the happiness of a home besides setting a bad example to the youngsters. Several matters which misguided couples make the basis of quarrels and fights can easily be settled by a little explanation and a patient hearing of it.

Both husband and wife must remember that they are but human, not divine, beings, and slight errors and deficiencies cannot but happen even in the best regulated families. There must be a certain amount of forgiveness from either side and in some cases husbands and wives if anxious to maintain domestic peace and happiness, will have need to exercise much patience in settling several matters which, for want of this mother-virtue, would end in great trouble, disagreement and disunion in the house. The fact must be well remembered that in cases of family feuds the best umpire to refer to for deciding the points at issue is their own conscience. The arbitration of relatives and friends will more or less, be intrusive and mortifying to self-dignity. The disputants can consult their conscience at such times and obey its dictates with a spirit of patience, forgiveness, and readiness to make amends.

A family is the primitive element of society and its relations are derived from Nature itself. All bodies of organic composition whether in the animal or of vegetable kingdom, while living however rudimentary their life may be—require mating and union of male and female or equivalents thereto for the propagation and continuance of species. Man, being not exempt from the operation of this physical law, as was proved, according to the Bible, from the beginning of the world, when Adam found it worthless to live without the existence of an Eve by his side, could not be a perfection in species without union with woman. The one calls for and presupposes the other who, between them, make one unity in two bodies. The offspring resulting therefrom are, in reality, a prolongation and continuation of the primal union. The same process is, of course, repeated in successive generations *ad infinitum*.

Marriage is not, therefore, an arbitrary institution, but the observance of a physical law, having for its end the propagation of children to supplant the parents and so continue the race by constant succession. In thus perpetuating the race, it is an important factor of evolution that each succeeding generation should be better fitted in its relation to its environments—or, in ordinary parlance, more perfect—than its preceding one. The responsibilities of parents in the matter of bringing up their children properly is, therefore, even greater than what their mutual obligations are; for, supposing a married couple sends out to the world half a dozen children without proper training, these half a dozen will, as generations go on, increase the number of ill-regulated families and badly brought up children, so that society at large will suffer considerably on this account,—and the cause of the wickedness, miseries, and troubles wrought by this large section will be attributable to the two who first formed the wedded pair, and neglected their duties to their offspring. Let not parents, amidst the ecstasy they feel when they hug their first-born to their bosom, forget their responsibilities to the little one. New duties spring up for both. The mother owes it her incessant care and an indefatigable sacrifice of comfort on its behalf just as she owes it her milk. The father owes it bread, clothes, his tenderness and watchful protection. The beasts and birds forget themselves while tending their young ones. Can man and woman, possessed with reason, degrade themselves below these? As the young one grows up, the responsibilities on its account also increase, and one of the greatest levers that works its success or failure in life is the home-training that it gets at the hands of its parents. Scores of indifferent and wicked boys and girls we come across, and if one will but enquire, their bad ways can invariably be traced to the want of proper parental care and training. Men and women have sunk into evil ways because their parents have failed to watch their youthful days and guide them in the fear and love of God and their neighbours. Fathers and mothers lead lives of luxury and, perhaps, dissipation, perfectly indifferent of the doings of their children or what their tendencies and

inclinations are. In the training given at home to young children, the mother is more responsible than the father. The home is the proper sphere of woman, and it is there, while youngsters are still with plastic natures, that she can easily mould and form their character; for "through the wide portal of a mother's heart have come the noble train of human virtues that have raised the race from, we know not, how crude and degraded a stage in physical and moral being, up to that high state which, in its perfect flowing in the souls of the redeemed has made men only a little less than the angels." A neat and simple home, presided over by a sober, gentle and hard-working man, assisted by pure, virtuous and amiable woman, and surrounded by children carefully brought up in the ways of righteousness and in the love and fear of God, would indeed be a little paradise on earth. What a relief to the toiling man, what a consolation to the self-sacrificing woman, and what an inestimable blessing to the youngsters! The task of imparting a sound moral training to children at home is heavy and tedious besides being difficult; but parents, cognisant of their deep responsibilities, have to face it manfully and do it thoroughly and sincerely. Need it be said that it should be done cheerfully, for does not the parent realise the inestimable blessings that follow his labours and does he not imbibe the blessedness of having been the cause of these noble effects? Faults and evil habits in young people, like diseases, develop the longer they are left unchecked; and parents should, therefore, use the knife of prudent correction early in life to cut and root out the weeds that hamper the moral growth of children. Let not parents be misguided by the reflection that so long as they feed and clothe their children and pack them, if need be, to school, they have done their duty to them. No, not at all. Their physical, personal, and intellectual requirements may have been thereby met, but their moral requirements, the most necessary thing for man in the true sense of the word, needs attending to. Children should learn from parents the great lessons under this head. They should learn from parents to distinguish good from evil, to love the one and attain it, to detest the other and shun it. Faults and failings should be corrected with firmness and calmness, not with anger and violence. Parents,

owing to their doting affection for children are prone to tolerate in them slight deficiencies, faults and failings. It is a serious risk; for their indulgence in the first word of impertinence, the small act of disobedience, the wee drop of wine, or the cheap little cigarette, may, in after years, be found to be the composition that manured the vile plants that have grown in the child, and to such an extent that it would be impossible to remove or check them.

"A little fire is quickly trodden out, which, being suffered, rivers cannot quench."

Parents should teach their daughters habits of modesty, truthfulness, morality, and unswerving rectitude. They should reveal to them the beauty of usefulness, the dangers of idleness, and the despicable worthlessness of frivolity. They should hold out for their daughters warning, examples of maidens who have gone astray and become wrecks of womanhood. They should teach their daughters duties of wives and mothers. Parents should bestow equal, if not more, care on their sons; for, these, perhaps, have to be separated from the influence of home at an earlier period than the daughters. They should be taught to imbibe the higher sentiments of our nature, upon which is based social existence, ideas of justice and order, compassion and charity. Much of our misery and debasement are the effects of ignorance. One who knows nothing, whose mental faculties are not cultivated, has naught but his physical powers to assist him; and physical powers have no value except in proportion to the direction given to them by the understanding. An ignorant man is, therefore, little better than a machine in the hands of one who works it for his own ends. Would parents wish their sons to vegetate in blind toil merely for the sake of their stomachs like the oxen that rend the furrows for nothing but a feeding, the owner who drives and goads them on profiting by their work? Children should be given sound instruction—the nourishment for the soul—in the same manner as they are given bread, the nourishment for the body.

More important than home training, and a sound education in a school or college, is the necessity for parents to give their children good example. The great orator Burke has said "Example is the school of mankind, and they will learn at no other." In every department of social life, example

exerts the greatest influence upon the members of society. In India, a Hindu girl must be married before she enters her teens; in Europe early marriage is rarely resorted to. What is fashionable in Europe is a serious sacrilege in India, not because the Indians do not understand and realise the advantages of the European, or the harmfulness of the Indian custom. Example that great dictator leads them on to move in the same groove. Men are always prone to follow other people in all matters—in customs, fashions, occupations, &c. Children, especially, quickly take lessons from examples. The greatest solicitude should, therefore, be exhibited in constantly presenting before them noble examples of good and virtuous character; and this cannot be done better than by the parents themselves becoming the examples for their children. Parents should never ignore the stubborn fact that their children would always follow the examples set by them. Words of advice and studied discourses to the young will avail but little, if they are not supported by example. Parents may preach ever so much about the evils of bad company or of drink; their full powers may be adjusted to portray the pernicious effects of these evils, but their efforts will not produce any appreciable result in children, if the parents themselves return home invariably the worse for liquor and in company with turbulent and boisterous companions. Parents should be very careful in their speech, actions, behaviour, &c., so that their children may profit by the example set before them; for, remember, children are like insects that take the colour from the leaves they feed upon. No sane man can expect his sons to be sober and temperate if he himself is a constant tippler. No mother has any right to expect her daughters to be virtuous if she herself is vicious. If parents are extravagant and profligate, how can children learn economy and virtue? If fathers and mothers keep bad company, use coarse language, and lead ribaldrous lives, how can their children be expected to be modest in their speech and action, and refined and cultured in their ways. Great is the responsibility of parents, therefore, in setting the best example before their children. In their daily conversation, in their habits at home, in their dress, in short, in everything, parents should exercise the utmost discretion, so that the children may draw salu-

tary lessons from them. Above all, in their religious practices, let not parents omit their obligations. Children should be brought up in the fear and love of God. Children should be insisted upon performing their daily religious duties, and parents themselves should not omit theirs. There can be nothing more blessed to see than a little child at prayer; and one of the happiest sights in this world is to see father, mother, and children, all together in daily prayer. The practice is one of the most beneficial for the welfare of the family and, surely, one that brings showers of blessings on the home. How consoling it is to see the father and mother, ripe in experience and versed in the troubles and trials as well as in the joys and happiness of this world, mingle with the little ones, so new to the ways of the world, in a common prayer for help, for mercy, or in thanksgiving to the One Great Creator in Heaven. Would the dear merciful Lord of all creation refuse to hear such a supplication? Never. The task of providing for the family which devolves on the father, the yet more tedious work of managing the family which rests with the mother, the difficult task of training up the children in the right way, pertaining to both of them—all these amidst trials and difficulties would become easy enough and light to bear, if God's blessing is upon them. Children themselves would naturally grow obedient and dutiful and parents will find them happy help-mates in their lives' struggles.

In the preceding lines, a few points that should strike a father and mother striving to attain happiness at home have been dealt with under the heads of (1) provision for a home, (2) the choice of a partner in life, (3) the mutual obligations of husband and wife, and (4) their responsibilities towards their offspring. There are, besides these, certain other points of a general character to be borne in the minds of parents. One of the chief among these is the avoiding of debts. Davenport Adams, speaking about this pernicious habit in his "Plain Living and High Thinking" says,

"Whether you enter upon your race, my friend, in the poor man's clothes of frieze, or the rich man's clothes of gold, form at the outset a habit of economy, accustom yourself to the strict measures of thrift, and cry to the demon of debt—Get thee behind me, Satan."

Amidst the several agencies that tend to mar domestic felicity, there can be none

other, save a vicious life, so disastrous as this great evil of incurring debts; and the writer, quoted above, has only drawn the most accurate comparison in having named it the Demon Satan. Some parents generally spend more than what they earn to keep up appearances; and, out of their foolishness, arises the necessity for incurring debts, which, in the end, will impoverish and ruin them, and land them in misery and starvation and unheard-of perplexities. The man who does not live within his means and who contracts debts to 'keep up appearances' is a dangerous man to society. He is in the first place a liar, for he cannot but speak falsehood to his creditors to obtain the money he knows he cannot repay. Secondly, he is a deceiver, as by shining in borrowed feathers, he prevents the public at large from forming a correct estimation of his worth. He is also a plunderer, and that of a high order, for he cleverly robs his creditors of what is theirs. He is, above all, a criminal before society, for by his example, he sets a degrading lesson to those around him. The Demon of Debt should, therefore, be avoided where one has an idea to establish Domestic Felicity. The two can never live together.

Another diabolical habit that should never be suffered to enter the threshold of a home is the Demon Drink. Like an avenging spirit, it goes forth from man to man, hampering progress, ruining constitution, banishing prosperity, increasing misery and want, feeding sin and crime, degrading women, spreading ruin around, and robbing human beings of all their noble qualities. No wonder, Shakespeare exclaimed, "Oh God, that men should put an enemy into their mouths to steal away their brains."

Two-thirds of the entire globe is occupied by the fathomless sea, and a mighty, almost infinite, scroll of lives have been swallowed up by this relentless element; but here within the narrow compass of a bottle, delusively, yet charmingly, sparkles a little liquid that has drowned more men and women than the sea—not drowned in glory, as often happens in the sea, but in abject dishonour and disgrace. This debasing vice is ruinous from every point of view—physical, intellectual, or moral. Reason, science, scripture, and experience have condemned it in the strongest terms.

"Oh, madness to think the use of strongest wine

and strongest drink our chief support of health when God, with these forbidden, made choice to rear His mighty champion, strong above compare, whose drink was only from the limpid brook."

A single drop of alcohol, it has been scientifically ascertained, when passed into the system is sufficient to cover the whole surface of the organs with which it comes into contact with an inflammatory poison capable of deranging the health to a great degree. What would be the result, if alcohol is consumed by glasses and even by bottles! Not only health will suffer, but everything else with it. Well has it been said that "where drink enters wisdom departs." Health and intellect fail and morals are lost. Man loses his brains, and often his soul. Davenport Adams says,

"Fatal to the development of intellect, fatal to the cultivation of moral faculties, fatal to high aims and generous impulses, is the drinking habit—the habit of swallowing glasses of intoxicating liquors on the pretence of good fellowship or in obedience to some self-created necessity."

In the twinkling of an eye, this accursed demon transforms individuals: The quiet man becomes boisterous; the gentle husband emerges as a tyrant; the virtuous woman becomes corrupt; young men and women, who otherwise would have been ornaments to society, turn out to be immoral vagabonds and degraded harlots. Hundreds of families would have been blest with domestic felicity if this Demon were kept at a distance. Husbands and wives, and sons and daughters whom God created to shed sunshine in their family-hearths would have been lustrous gems in the home, were it not for this debasing and demoralising vice. Fathers and mothers will do well to remember, whenever they have recourse to a glass of intoxicating drink, that it is not a wholesome draught that they swallow, on the other hand, that it may be the tears of the patient wife or the labouring husband, or the life-blood of their neglected and ill-provided children.

Every one born in this world has his duties to perform. The king has to govern his subjects; the soldier has to brave his enemy; the sailor should not quail at sea; the statesman has to see to the administration; the peasant has to look to his farm; so the husband and wife have their duties too, either towards each other or towards their children, and from which neither king nor peasant is free; for men in all walks of life, whether high

or low, rich or poor, have to emerge out of a home, from the guidance of parents. If parents, therefore, do the duties expected of them, the reformation of the world would be quite an easy matter, each successive generation would become more and more pure and elevated, and the expected millenium would be reached.

There would be no more broils and quarrels, fights and troubles; and instead of disunion, rupture and disgrace, instead of anger, hatred, and bloodshed, instead of anxieties, miseries and mortifications in the home, we shall see contentment, peace and happiness reigning.

JOHN OWEN SURRAO.

THE BEGINNING OF HINDU CULTURE AS WORLD-POWER

By PROF. BENQY KUMAR SARKAR, M. A.

(A. D. 300-600)

SECTION I.

Indian Napoleon's Alexandrian March.

IF we exclude the Assyrian, Egyptian and Persian Monarchies of ancient times, the Maurya Empire of the Hindus (B.C. 321—B.C. 185) was, chronologically speaking, the first Empire in the world's history, and that, internationally speaking, it occupied the first rank in the contemporary state-system. At a later stage in the world's history another Hindu Empire became similarly the very First Power of the world. This was the celebrated Empire of the Guptas (A. D. 320—606). There was now "anarchy" (?) in China. With the incursions of Barbarians into the Roman Empire, Europe was immersed in her "Dark Ages." The Saracenic Caliphate of the followers of Islam was not yet come. It was the people of Hindusthan who enjoyed the real "place in the sun."

While noticing the military and political achievements of Samudragupta (A. D. 335—375), one of the Emperors of this House, Mr. Vincent Smith—to whom indologists owe the only "chronological narrative of the political vicissitudes of the land"—makes the following remarks :

"Whatever may have been the exact degree of skill attained by Samudragupta in the practice of the arts which graced his scanty leisure, it is clear that he was endowed with no ordinary powers; and that he was in fact a man of genius, who may fairly claim the title of the Indian Napoleon. * * By a strange irony of fate this great king—warrior, poet, and musician—who conquered nearly all India, and whose alliances

extended from the Oxus to Ceylon—was unknown even by name to the historians until the publication* of this work. His lost fame has been slowly recovered by the minute and laborious study of inscriptions and coins during the last eighty years."

It may be mentioned, in passing, that monarchs of the Samudragupta type, who may be compared easily with a Charlemagne, a Frederick or a Peter the Great have flourished in India almost every second generation. Hindu folk-lore has known them as Vikramadityas (Sun of Power) and has invested their names with the halo of Arthurian romance.

It is unnecessary to wait long over the political achievements of the Gupta Emperors. The *Digvijaya* or 'Conquest of the Quarters' made by Samudragupta fired the imagination of a contemporary poet, Kalidasa, the Goethe or Shakespeare of Sanskrit literature. The following are some of the verses from Canto IV of his immortal epic, *Raghu-vamsam* ("The House of Raghu") translated by Griffith for his *Idylls from the Sanskrit*, which describe the triumphal progress of his hero Raghu :

"Fortune herself, sweet Goddess, all unseen,
Held o'er his sacred head her lotus screen,
And Poesy in minstrels' form stood by,
Swept the wild string, and raised his triumph high.
What though the earth, since ancient Manu's reign,
Was wooed by every king, nor wooed in vain;
She came a bride, with fresh untried charms,
A pure young virgin, to her Raghu's arms.

* * *

Scarce was he ready for the sword and shield
When autumn called him to the battlefield,—
War's proper season, when the rains are o'er,
When roads are dry, and torrents foam no more.

* First Edition, Clarendon Press, Oxford, 1905.

Soon as the day to bless the chargers came,
The warrior's holy festival, the flame
Turned to the right, and with a ruddy hand
Gave him full triumph o'er each distant land
Then when his Kingdom was secured, and all
His city fortified with tower and wall,
His hosts he marshalled, his broad flag outspread,
And to subdue the world his army led.
Forth as he rode, the city matrons poured
The sacred grain upon their mighty lord.

First to the East the hero takes his way,
His foemen trembling as his banners play.
Thick clouds of dust beneath his chariots rise,
Till dark as earth appear the changing skies,

He marked his progress with a mighty hand;
The fountain gushed amid the thirsty sand;
The tangled forest harboured beasts no more,
And foaming floods the freighted vessel bore.

Through all the East he passed, from land to land,
And reached triumphant, Ocean's palmy strand.
Like an unsparing torrent on he went,
And low like reeds, the lords of Suhi⁴ bent
Then fell the islets washed by Ganga's wave
Nor could their ships, the hosts of Banga⁵ save.

No wealth he sought, but warred in honour's name,
So spired his land but spoiled his warlike fame.

But louder, as the war-steeds paced along,
Rattled the harness of the mail-clad throng.

* * *

True to the Law thus Raghu marched by land
 To Parasika 3 with his conquering band.
 He saw, indignant, to the lotus eyes
 Of Yavana dames the wine cap's frenzy rise.

Mad was the onset of the western-horse,
And wild the fury of the conqueror's force ;
No warrior saw—so thick the dust—his foe,
But marked him by the twanging of his bow.
Then Raghu's archers shot their keen shafts well ;
The bearded head of many a soldier fell,
And covered closely all the battle-ground
Like heaps of honey that the bees surround.

Pale grew the cheek of every Huna's dame,
Trembling in wild alarm at Raghu's name.

By him subdued, they force I their pride to bring
 Coursers and gold as gifts to Kosal's King.
 Borne by these steeds he climbed Himalayas hill,
 Whose crest now clothed with dust rose loftier still.

**Fierce was the battle with the mountaineers
Armed with their bows and arrows, stones and spears.**

The thick sparks flying as they met. Then ceased,
 Slain by his arrows, from the mirth and feast
 The mountain revellers, and minstrel bands,
 That walked as demi-gods those lofty lands,
 Were taught the hero's victories to sing,
 And each hill tribe brought tribute to the King.

Thus when all princes owned the conqueror's sway,
He turned his chariot on his homeward way,
Letting the dust, beneath his wheels that rose,
Fall on the diadems of humbled foes "

It was the atmosphere of this poetry which nurtured the nation of Kumarajiva.* Fa-Hien and Kalidas were contemporaries, and if the Chinese traveller had cared to know some of the prominent Hindus of his time, the first man to be introduced to him would have been Kalidasa. But it seems from Fa-Hien's diary that he had not much leisure to go beyond his special mission. However, it was the Indianism of Kalidasa's age with which the Chinese Apostle came in contact. It was this Hindu Culture which was propagated in China and finally transmitted to Japan to build up her *Bushido* and *Yamato Damashii*. Buddha-cult was introduced into Korea from China in A. D. 372, and from Korea into the Land of the Rising Sun in A. D. 552.

SECTION 2.

"World-sense" and Colonising enterprise.

The Hindus of the fourth, fifth and sixth centuries were not living in 'splendid isolation,' as it has been the fashion to suppose that the Asiatics have ever done. As in previous ages, so under the Guptas they kept up cultivating the "world-sense."

In the first place, it must be remembered that India alone is a world by herself—the whole of Europe minus Russia. Therefore, for the Hindus to be able to develop the "India sense" in pre-Steam days must be regarded as an expression of internationalism of a high order. Considered territorially, and also in terms of population, the world-sense of the Roman Emperors was not greater than that of the Hindu Imperialists.

The internationalism of the Hindus was extra-Indian too. It is well-known that the world of Kalidasa's poetry includes

* An Indian educator, who carried forward the missionizing activity of Asoka to the Far Eastern Cathay, and thus became instrumental in the establishment of Indian hegemony throughout the Orient.

the whole of India and also the Indian border land and Persia. The fact that with the fifth century is augmented the stream of traffic between India and China both by land and sea is itself an indication of the "Asia-sense" they had been developing. It may be said that the Mauryas had cultivated mainly the relations with West-Asia, the Kushans had opened up the Central-Asian regions, and the Guptas developed the Far Eastern intercourse. The Hindus could now think not only in terms of India but of entire Asia.

The larger world beyond Asia was also to a certain extent within the purview of the Hindus. Ever since Alexander's opening up of the West-Asian route, the Hindus had kept touch with the "barbarians." About the first century A.D., Hindu trade with the Roman Empire was not a negligible item of international commerce. The *Periplus of the Erythraean Sea* (c. A.D. 100) is a document of that Indo-Roman intercourse. Both the Kushans in the North and the Andhra Monarchs in the South were interested in Rome.

In the *Imperial Gazetteer of India* (India Vol. II.) Sewell describes the foreign trade of the Hindus under the South Indian Andhras (B.C. 200—A.D. 250):

"The Andhra Period seems to have been one of considerable prosperity. There was trade both overland and by sea, with Western Asia, Greece, Rome, and Egypt, as well as with China and the East. Embassies are said to have been sent from South India to Rome. Indian elephants were used for Syrian warfare. Pliny mentions the vast quantities of specie that found its way every year from Rome to India and in this he is confirmed by the author of the *Periplus*. Roman coins have been found in profusion in the peninsula, and especially in the south. In A.D. 68 a number of Jews, fleeing from Roman persecution, seem to have taken refuge among the friendly coast people of South India and to have settled in Malabar."

The following picture of foreign settlements in Southern India is given by Vincent Smith:

"There is good reason to believe that considerable colonies of Roman subjects engaged in trade were settled in Southern India during the first two centuries of our era. And that European soldiers, described as powerful Yavanas, dumb Mlechas (barbarians), clad in complete armour, acted as body guards to Tamil kings."

According to the same authority Chandragupta II. Vikramaditya (A.D. 375—413) of the Gupta dynasty was "in direct touch with the sea-borne commerce with Europe through Egypt."

Besides, intercourse with Further India and the colonisation of Java form parts of an adventure which in Gupta times was nearing completion. In fact, with the fourth century A.D. really commences the foundation of a "Greater India" of commerce and culture, extending ultimately from Japan on the East to Madagascar on the West. The romantic story of this expansion of India has found its proper place in Mookerjee's *History of Indian Shipping and Maritime Activity from the Earliest Times*. The heroic pioneers of that undertaking were all embodiments of the world-sense.

It would thus appear that the travels of Kumarajiva the Hindu Missionary (A.D. 405) and of Fa Hien the Celestial Apostle were facts of a nature to which the Indians had long been used. The Chinese monks came to a land through which the current of world-life regularly flowed. Hindustan had never been shunted off from the main-track of universal culture. To come to India in the age of the Guptas was to imbibe the internationalism of the atmosphere.

Regarding the Indo-Chinese intercourse of this age the following extracts from *The Epochs of Chinese and Japanese Art* are interesting.

"Of what took place in the Tartar regions of the north we know little, since their dynasties have not been recognised by Chinese historians as legitimate. The true Celestial annals, indeed the lore of Chinese genius, belong at this time to the stimulus afforded by the new southern conditions. The new capital, near the present Nanking, was on the great Yangtse. * * * The Southern seats of the Chinese were in closer proximity to a new part of India, the south through Burma, or along the opening lines of coast trade. * * * It was here, too, in the Southern Chinese nests, that Buddhism could drop her most fertile germs."

It may be mentioned that the patriarch Bodhidharma, originally a South Indian Prince, reached Canton by sea and was then invited to Nanking (A.D. 520).

The above is a picture of the sea-traffic. References to this are to be found in the *Kwai-Yuen Catalogue* (A.D. 730) of the Chinese *Tripitaka* which has been drawn upon by Prof. Auesaki for his paper in the J. R. A. S. (April, 1903).

It must not be forgotten, besides, that Kucha and Khotan, the half way house between India and China, remained all this while the great emporium of Hindu culture and Greeco-Buddist art. Manus-

cripts, unearthed by Stein and others, both in Kharoshthi and Chinese Scripts, prove that Central Asian Indianism flourished during the period from 3rd century A.D. to 8th or 9th. And it was the Central

Asian land-route which was traversed by Fa Hien in A.D. 399 and later by Hiuen Tshang in A.D. 629 on their way to India, from which both returned home by sea.

A VISIT TO THE BENGAL CHEMICAL AND PHARMACEUTICAL WORKS

BY PROF. SATIS CHANDRAMUKHERJI, M. A., B. SC.

IN our college days, whenever we had to read of a chemical works we had to depend on diagrams for forming our idea about it, for there was no factory near by where chemical processes were applied to manufacture. But now things have changed. Students of chemistry are taken over to the Bengal Chemical and Pharmaceutical Works to bring them face to face with the application of science to industries. In this way, not only do the young men get a clear understanding regarding a chemical works and a vivid object lesson, but they also gain self-confidence as here are our countrymen actually carrying on a manufacturing business, on a gigantic scale, requiring great power of organisation and rare expert knowledge of science.

Those who have seen only the unpretending and rather unsightly office of the firm at 91, Upper Circular Road, have a pleasant surprise in store for them if they can manage to pay a visit to the vast works at Manicktola (near the ditch) where the articles are turned out. The works occupy no less than eleven big has of land and recently fifteen big has more have been acquired for further extension. It really does one good to have a look round the whole thing, consisting of various buildings and structures for manufacture of scientific apparatus, acids, chemicals and medicines, etc. Limited space of a single article does not permit more than a very short description of the works.

It has been my lot to visit the Works more than once during the last fifteen years and I have been able to observe the rapid strides with which the Works has advanced in the path of improvement. A

recent visit to it has convinced me that the early promises have been fully realised.

As one enters the factory he finds big store rooms of various articles in one of which tons of sulphur have been heaped up, filling the room up to the ceiling. Then comes a printing department with an up-to-date press. Next one comes to the installation of steam saw mills, as all the packing cases, barrels, etc., are made on the spot. Farther on one is led through a long stretch of the workshop where various scientific apparatus like Bunsen burners, tongs, forceps, and even chemical balances are turned out. Then we enter the department of pharmacy where excellent arrangements like heating by steam coils, vacuum pans, pumps, etc., are made use of to ensure the purity of the medicines manufactured. Adjoined to this is the department for manufacture of chemicals like acids, ammonia, sodium bicarbonate, magnesium sulphate and so on. Then there are the three gigantic lead chambers for the preparation of sulphuric acid. Recently the manufacture of boracic cotton and antiseptic dressings has been taken in hand to meet with a widely felt want. Last, though not the least, we come to the chemical laboratory where experiments are being carried on to suggest improvements in the methods of preparation or to introduce the manufacture of some new chemical. The chemist in charge showed us how he has successfully prepared thymol from aqua ptychotis. The office is adjoined to the Laboratory. No less interesting is the bottling and packing arrangements—everything being done with the aid of machinery. The output has to cope with the heavy demand suddenly

made upon the resources of the concern by the stoppage of supplies from Europe.

The feeling one has at the end of this visit is one of stupefaction and awe.

In these days when we hear of the failures of so many Swadeshi enterprises, it is highly reassuring to find that this works, a Limited Company, has been even in a prosperous condition. Though it keeps a large share of its profits in its Reserve Fund, it has been paying seven per cent dividend for a long time. It has a capital of five lacs which will soon have to be increased in view of the extension taken in hand and employs close upon 200 men working under the guidance of four expert chemists.

In this connection we shall do well to notice one peculiarity of the Bengal Chemical Works. The founders have always availed themselves of the best expert knowledge of chemistry. They have been liberal in paying decent remunerations to their chemists, some of whom even share in the profits. No wonder that these chemists are single-minded in their devotion to this Works.

If we look into the English scientific journals of the present time, we find that great authorities like Professor Fildes and others, are lamenting over the backwardness of the scientific works of England compared to the German Works. The chief reason of this backwardness is that the English manufacturers have never employed well trained scientists in the works whereas in the German factories a large number of first class scientists are employed. We hear that in some big chemical works in Germany about a hundred chemists with university degrees are engaged in experimenting in the laboratories and fifty with a view to find out some new and cheaper method of manufacturing certain chemicals. But in England, unfortunately, there has been a divorce between the factory and the university. The manufacturers look upon the university men as unpractical and useless people while the university takes little interest in the commercial problem of the factory. The result has been that the operations of the scientific works are often carried on by the rule of thumb method and after a time the works fail to compete with German works helped by expert scientific advice. Nowadays, attempts are being made in England to rectify this error. In the light of this

fact, it appears really highly creditable for the agencies of the Bengal Chemical Works that they would all along take the help of able chemists with high academic qualifications.

Now it is interesting to look at the history of this works. Like many other great things it had a humble beginning. It was in the year 1891, long before the Swadeshi movement, that Dr. P. C. Ray, then a junior professor in the Presidency College, started a modest works for the preparation of some chemicals and medicines at 91 Upper Circular Road and he was soon joined by the late lamented Dr. Amulya Charan Bose, who was equally indefatigable in his exertions to make the business a success. Dr. Ray had recently come back to the country after taking his D. Sc. degree from the Edinburgh University and found that the educated Bengalis had great difficulty in earning their livelihood, as the professions were already overcrowded. If some industries could be started, that would have opened a new source of income. This idea led Dr. Ray to found this works.

During the infant stage of this works, not only the whole work of the chemist but also the brunt of the business management fell upon Dr. Ray. The labour and money ungrudgingly spent by him have been amply repaid as the seed thus sown and carefully nurtured has now developed into a magnificent and fruitful tree.

For those who see him work regularly at the College devoting every spare moment after his heavy professorial duties to the prosecution of research work, it is difficult to guess, that he the contributor of more than three scores of original papers on mercurous nitrite and numerous compounds and the author of the monumental History of Hindu Chemistry is also the founder and guiding spirit of a big commercial enterprise. When the history of the Swadeshi industry comes to be written, the name of Dr. P. C. Ray will be mentioned as one of the few pioneers and captains of industry.

The recent war conditions, cutting off the supply of many articles which used to come from Germany have certainly created an opportunity for home industries. But unfortunately due to our unpreparedness, Japan has taken possession of the market, leaving us as poor as ever. It is a relief, however, to find that the Bengal Chemical

and Pharmaceutical Works has seized upon the opportunity. It has considerably increased its outputs and has begun to prepare many new chemicals for the first time in the country, such as thymol, magnesium sulphate and so on.

The limited space of the article does not permit me to describe the many ingenious processes of manufacture that are employed in the Works. So for the present we shall have to be satisfied with a brief description of one of them, namely, the manufacture of magnesium sulphate.

Magnesite, an Indian ore, is pulverised in a machine and then treated with sulphuric acid in a reservoir, the mixture being kept heated by steam. The large amount of carbon dioxide gas that is given off during this process (as will be evident from the formula of magnesite, $MgCO_3$, about half the weight of the ore being carbon dioxide) would have been wasted. But here this gas is led by a pipe to a gas-holder whence it is pumped under pressure into another reservoir containing sodium carbonate, which is thereby converted into sodium bicarbonate. This utilisation of the waste-product considerably lessens the cost of production of magnesium

sulphate so that even after the removal of the advantages due to war conditions the company will be able to compete with foreign manufacturers. Now the mixture containing the crude solution of magnesium sulphate is taken out and carried in trucks over rails to an apparatus where it is filtered under pressure. The filtered liquid is then concentrated and allowed to crystallise in a series of tanks. The crystals are then taken out and brought to a powerful centrifugal machine (worked by an oil engine) where they are dried and made ready for packing. The barrels and packing cases, too, are made on the spot, as has been already pointed out.

Before I conclude it is my pleasant duty to express my thanks to Mr. Rajsekhar Bose, Manager and Head Chemist of the works, who was courtesy personified; to Mr. Satishchandra Das Gupta, the able Factory-Superintendent, who is ever on the look-out to devise ingenious methods; to Mr. Prabodhchandra Chatterji who is in charge of the laboratory and is working out processes for manufacturing thymol etc.; and to Mr. Surendra Bhusan Sen, who is in charge of the acid department.

REVIEWS AND NOTICES OF BOOKS

ENGLISH.

I. Village Government in British India : by John Malhai, Vakil. High Court, Madras, with a preface by Sidney Webb. London, T. Fisher Unwin, Ltd. 1915. 4-6d net.

The object of the book is to present a connected picture of the methods adopted by the village community to meet such simple administrative needs as the settlement of disputes, the prevention of crime, and the improvement of the means of general well-being. In the introductory chapter the author shows that in Hindu times the isolation of the village was not quite so pronounced as in the Mahammadan period. There were officers of the king, of varying degrees of authority, through whom the king maintained watch over the village. This he proves by extracts from the *Arthashastra* and the *Sukraniti*, and also from some South Indian inscriptions. The Mughal Government was almost entirely fiscal, and so long as the taxes were duly paid, no connection was maintained between the villages and the King's Government. The village community has lost much of its internal

cohesion, but 'as an administrative organ of great potential usefulness for the rural population the village community is by no means dead.' In the chapter on Education the author says that the principal characteristic which distinguished the village schools of the Hindus from the Muhammadan *Maktabs* was the secular character of the teaching. "It is likely that prayers might have been offered in the course of the day's work, and that moral precepts were strengthened by the teaching of sacred legends, but anything in the nature of direct religious instruction was unknown. The principal ingredients of the village curriculum were reading, writing and arithmetic in the vernacular, with occasionally a dose of Sanskrit Grammar and poetry. The secular character of the schools was strengthened by the advent of Buddhism." Those who are in favour of compulsory religious education in our modern schools would do well to note this. Possibly what they mean by lack of religion is not the decay of morality but of the virtues of politeness and obedience, and the non-observance of certain ritualistic practices, the reason for which may lie elsewhere than in the absence of religious teaching. After

village schools comes the village system of poor relief, which is followed by an account of village sanitation, represented by the physician, midwife and scavenger. This is followed by a chapter on such public works as wells, tanks, canals, roads, and public buildings (meeting places and rest houses, temples or mosques), which again is followed by an account of the village system of watch and ward (the headman and his assistant, the watchman.) The administration of justice next engages the author's attention, and village arbitration and conciliation boards, the village panchayets, are passed in review. The old communal panchayets were certainly useful in their day, but Sir Henry Maine was of opinion that "he who would bring to life again one of these barbarous institutions is placed in the following dilemma: Either he must connive at many of their accompaniments which are condemned by modern morality and modern civilisation, or in the attempt to give them a new character, he must so transmute them that they cannot be distinguished in any sensible degree from the modern institutions by which civilisation has superseded them." The author very rightly objects to the use of the term 'barbarous' with regard to these institutions, and believes that their resurrection would prove highly beneficial in the adjudication of petty disputes, as the institution of village Munsifs in the Madras presidency and the success of the co-operative movement everywhere amply demonstrates. Finally, some of the paragraphs of the Local Self-Government Resolution of the Government of India, issued in May 1915, and dealing with village panchayets, are summarised. There is a bibliography attached to the book. The materials of the book have been almost entirely drawn from government reports and publications, and the result is that the views expressed are somewhat official in cast and character, but in all other respects it is a highly useful and timely publication, and we welcome it as a valuable addition to Indian socio-economic literature.

The preface, though brief, deserves separate notice, as it is full of thoughtful suggestions. Mr. Sidney Webb begins by saying that "we sometimes tend to exaggerate the extent to which the clutches of caste have prevailed over the community of neighbourhood..... But we have seen that, even where caste exists, it has, in fact, permitted a great deal of common life, and that it is compatible with active village councils." Then follows a most important statement: "The first and most important business of a Government is, after all, that its people should live and not die! In the long run, in the judgment of history, it is by this test that Governments will be judged. How does India stand this test? In the most civilised parts of Europe.....we have about doubled the average expectation of life of the whole population. Seeing that in India, where the circumstances are more adverse, the average expectation of life of the people is only somewhere about one-half that of the people of England, there is perhaps no direction in which the community could more profitably invest its thought, its effort, and its money, than in a wise development of its local self-government. [Footnote: What a loss, what a tragedy it is that so many of India's most valuable citizens die before they are fifty! A deliberate scientific investigation into the causes of premature death in India, of adults subject neither to privation nor to industrial accidents or diseases, might be of great value]." Mr. Webb then goes on to contradict the statement, based on Census Reports, that

the people of India are a people of villagers. "But it is a mistake to assume that a land of villages necessarily means what is usually implied by the phrase, a people of villagers. In truth India, for all its villages, has been also, at all known periods, and today still is, perhaps to a greater extent than ever before, what Anglo-Saxon England, for instance, was not, or the South African Republic in the days before gold had been discovered, and what the Balkan Peninsula even at the present time may perhaps not be, namely, a land of flourishing cities, of a distinctly urban civilisation, exhibiting not only splendid architecture, and the high development of the manufacturing arts made possible by the concentration of population and wealth, but likewise—what is much more important—a secretion of thought, an accumulation of knowledge, and a development of literature and philosophy which are not the least like the characteristic product of villagers as we know them in Europe or America." The last words of the preface give Mr. Webb's view as to the place which local self-government is destined to occupy in the life of the Indian nation. "I do not in any way deprecate the desire or belittle the claim that India, like other parts of the British Empire, should be administered in the main by Indians, in accordance with Indian public opinion. But in India, as elsewhere, it is Local Government that is destined to grow, at a much greater rate than Central Government and the importance of the field thus opening out should not be overlooked. There is here, as it seems to me, a greater and certainly a more accessible sphere for the exercise of autonomy. In practice it will be found, as the century advances, that by far the greater part of "Indian self-government" and more and more of the part in which the daily lives of the Indian people are most intimately concerned, will lie, not in the sphere of His Excellency the Viceroy in Council,—not even in that of the Provincial Governments—but in those of the Village Council, the District Board, and the Municipality, or of any local authorities that may supersede them. In the fully organised India of a century hence, as in the England of tomorrow, it may well be that it may be these or some analogous bodies, that will be found exercising actually the larger part of all the functions of government, expending the large part of that share of the people's income which is administered collectively, appointing and controlling the majority of all the salaried servants of the community, and even enacting, in the aggregate, in their byelaws and regulations, a greater volume of the laws that the people obey." Let us share the hope of so wellknown an authority as Mr. Sidney Webb, and trust that both the Government and the people will begin to develop local self-government by devoting more attention to village sanitation and village education.

II. Indian National Evolution: by Ambica Charan Maumdar, Nateson & Co., Madras, 1915. Price Rs. 2.

This bulky volume of 500 pages and more is no mere *rechauffé* of recent political events in India. It is this and much more. It is a history of the rise and growth of the spirit of nationalism in India, and it passes in brief review the whole political horizon since Lord Ripon's memorable viceroyalty. The headings of some of the chapters will give an idea of their contents: 'The Genesis of Political Movement in India'; 'the Partition of Bengal'; 'the Indian Unrest'; 'the Depression'; 'Reorganisation of the Congress'; 'Indian Renaissance'; &c. In the Appendix the constitution of the Congress and other useful matters have been incor-

porated. Portraits of all the leading Congressmen is a welcome feature of the publication. The work is singularly free from quotations, and we have a continuous narrative written in a pleasant style. The case for the Congress has been soberly put and supported by a wealth of arguments, and antagonistic views have been judiciously met. The result is that very little of what requires to be said in order to present the national cause in its true light has been left unsaid. The author's remarks are often pointed and forceful and one feels tempted to quote freely from the book, but we refrain as we think that the book deserves to be read from beginning to end. Mr. Mazumdar has served a long period of apprenticeship in local, provincial and Indian public life. He has taken a leading part in the deliberations of the Congress and in the legislative council of his own province. Above all, he has all his life been a devoted student of politics. A volume containing his mature convictions on the political situation in India is therefore bound to be instructive. We want Indian politics to be handled by veterans of this type, for what they put down as their deliberate views is bound to carry weight with all thinking men. Mohussil civic life in Bengal would be all the richer with more public men of his wide outlook and political culture. We hope the book will find a ready sale among our countrymen, for it will substantially help their political education.

III. Mukundaram : A Glimpse of Bengal in the 16th Century A.D. and other essays; by Prof. J. N. Das Gupta, Presidency College, Calcutta.

These papers have been collected and printed by the Calcutta University in book form. The book has been named "Bengal in the 16th Century A.D." (Cambray & Co., Price Rs. 2). We have read the book. It consists of eight lectures delivered by Prof. Das Gupta as University Reader, in which the learned professor has shown that there was a Renaissance, a spiritual and intellectual awakening in Bengal in the sixteenth century, and he has supported this conclusion with reference to the literature of Vaishnavism, the Institutes of Akbar, the works of Mukundaram, and the contemporary narratives of European travellers. The inaugural lecture on the study of history is a learned essay. The lectures consist of a string of quotations, but perhaps in the nature of things this could not well be avoided. Sanskrit, Buddhist (Pali) and original Persian sources do not appear to have been consulted. A full bibliography would have enhanced the value of the book. The identification of Ralph Fitch's 'Serrepore' with 'Serampore' is evidently a mistake. Fitch speaks of Sripur, the capital of Chand Ray ('Chondery') and Kedar Ray in Vikrampur. The book has been neatly printed and got up by the University Press, though printing mistakes are not uncommon. Prof. Das Gupta has opened an interesting field of research, and we hope competent scholars, as learned in Sanskrit, Pali and Persian as Prof. Das Gupta is in English, will take up the work, and bring the past history of Bengal, specially in its sociological aspects, into the full light of day.

IV. The Proposed Muslim University: by Syed Rauf Ali, Bar-at-Law, Delhi.

This is one of the many controversial pamphlets now being issued by those interested in the Muslim University. We have seen another pamphlet in which the advisability of accepting a constitution on the terms proposed by Government is advocated. In this brochure the policy of waiting and watching till the

war is over is supported, not without a show of reason. The Benares Hindu University type is, according to the writer, a settled precedent, and it cannot in any case be denied to the Mahomedans whenever they choose to ask for it. So they lose nothing by waiting and deliberating, and watching the growth of the Benares University. They will certainly be the wiser for it. The writer hopes that Sir Syed Ahmed's programme of "Self government in matters educational" will be accepted by the Government.

V. Report on the Sociological Survey of the Servants of the Khangi Department of the Baroda State: 1914. Baroda Printing Works.

The go-ahead state of Baroda is nothing if not new in every department of its activity. The lower employees of the Khangi department of the State were examined as to their physical, social, economic, moral and intellectual, and religious condition, and the result of the various examinations was tabulated and sorted under distinct heads, and the following conclusions were arrived at: (1) They live in insanitary houses and surroundings. (2) They are not quite strong and robust as they ought to be. (3) Their expenses exceed their income and as its result they are largely indebted and pay usurious rates of interest. (4) They are ignorant, superstitious and without any high ambition or aspirations in life. Certain remedies are then suggested. His Highness proposes to direct such sociological surveys in particular villages from time to time. Their utility has been made obvious in this concise report. Such surveys may usefully be undertaken by public bodies in Bengal. The result is sure to be an eye opener in many ways, and would put new life into the movement for social reform.

VI. Anthology of Patriotic Prose: Selected by Frederick Page. Oxford University Press, 1915. Two shillings net.

This is a volume of quotations from the speeches and writings of distinguished men in the English language which are calculated to evoke a love of country. It is a very useful publication, and ought to find a ready sale in India. The fact that the book has been brought out by the Oxford University Press is sufficient guarantee of the excellence of its contents.

VII. The Navy: by A. C. Macartney. The Christian Literature Society for India, 1915. Price annas four only.

In this neatly printed and well written pamphlet the author has tried to show among other things, "that the contention that the British navy, that Navy which helped to liberate Greece, which played so great a part in putting down the slave trade, which has driven all but German piracy from the seven seas, is not such a menace to civilisation and peace as the German Army."

VIII. Western Education in India: by S. Ambavaniswar, B. A. Trichinopoly. Wednesday Review Press, 1915. Four annas.

This is a reprint of some articles which appeared in the Wednesday Review. All subjects appertaining to the present political, social, moral and intellectual development of the country are briefly passed in review from a liberal and hopeful standpoint. The pamphlet well repays perusal.

XI. Sir Henry Cotton: A sketch of his life and career. G. A. Natesan & Co., Madras. Price annas four.

This is one of the well-known series of the "Friends of India," and the little volume has been got up with the usual discriminating power of selection displayed by the Editors of the series. Those who want to know about the great man recently dead will find everything in a nutshell in this brief sketch.

X. Puri for the Health Seeker and the Hindu: by Jodunath Ganguly, B.A., M.B. · Benares, December 1915. Price one anna.

This unpretentious little pamphlet contains a mass of useful information on Puri both from the sanitary and the religious point of view.

XI. Documents and Extracts illustrative of English Constitutional History: Vols. I. and II.

The object of this compilation is to put together a few of the more important documents which tend to throw light on the development of early English institutions and the progress of constitutional movements in English history. It is hoped that this collection of papers will impart a reality and a living interest to the study of constitutional history among the graduates and under-graduates of the Calcutta University.

XII. Students' Manual of General Philosophy: by S. C. Sen, M.A., B.L. Second Edition. S. Ray & Co., Cornwallis Buildings, Calcutta. Price Rs. 1-4-0. 1915.

The book is a short treatise on philosophy intended for the use of University students. It deals with the general problems of philosophy in a clear, concise and systematic way. The beginner generally finds it difficult to grasp the real significance of any particular problem and discover its place in the general scheme of thought. To meet this difficulty the different topics have been arranged in their natural order and the transition from one problem to another has been clearly indicated. The author seems to have spared no pains to make the book useful both as a preliminary study and as an examination manual. Though specially intended for students it will also prove a profitable study to those who interest themselves in metaphysical thinking and would like to have a clear knowledge of the development of modern speculative thought within a short compass.

P.

Prosody and Rhetoric by Prof. Rohy Datta. The booklet has been dedicated to the Hon'ble Justice Sir Asutosh Mookerjee, Kt., C. S. I.

The Author says he has "spared no pains in making the subject really interesting and setting forth the latest ideas." But our misfortune is that we find his ideas rather old, at least by ten years. His book is *Prosody and Rhetoric*, but Mr. R. Bose's *Rhetoric and Prosody* has been in the market for several years past. We have compared the two treatises and now without any ceremony offer the result to the public. There is an overwhelmingly large quantity of internal evidence to show that Mr. Datta's book was absolutely unnecessary.

Let us compare the *Rhetoric* first, because this is Mr. Bose's first part, though Mr. Datta's last. Take, for example, *Allusion*. Mr. Bose says:

"ALLUSION."—This figure consists in using some word or expression which recalls to one's mind some well-known past incident, or the saying of some great man: e.g., It was not given to Goldsmith to feel "like the monument," on any occasion whatsoever. —Black.

The allusion, here, is to a remark once made by Dr. Johnson. When he was asked by his friends how he received the news of the failure of his tragedy *Irene*, he replied, "Why, like a monument," i.e., with the utmost indifference.

The ungainly Irishman was called to *make sport for the Philistines*.—Black.

The italicised expression reminds us of Samson, the Jewish hero. It was during the period of his captivity that he was called upon by the Philistines to make sport for them."

There are two more examples given here. For obvious reasons we refrain from quoting them. But let us see what Mr. Datta has to say on this point. He says:

"Allusion is the use of a word or expression recalling to the mind some well-known saying or incident, e.g.,

(a) The ungainly Irishman (Goldsmith) was called to *make sport for the Philistines*. (Black). [The allusion is to Samson the Jewish Hero, who, during his captivity, was called upon by the Philistines to make sport for them.]

(b) It was not given to Goldsmith to feel "like the monument." (Black). [The allusion is to a saying of Dr. Samuel Johnson. When asked how he received the news of the failure of his tragedy *Irene*, he replied, "Why, like the monument" (i.e. with entire indifference).]

Here it is quite evident that Mr. Datta in his book has spared no pains in turning participial and other phrases into clauses and clauses into phrases in which he is a masterhand and finding out exact equivalents for English words. And this is the case in the entire Rhetoric. Compare Tautology, Pleonasm, Hypallage, Asyndeton, Polysyndeton, Hendiadys, Zeugma, the Condensed Sentence, Prolepsis, Litotes, Euphemism, Innuendo, Periphrasis, Epanaphora, Epistrophe. And the same state of things is found throughout the chapters on the figures of Rhetoric, the Choice of Words, Construction of Sentences, Forming of Paragraphs, etc.; etc. would give more concrete examples. Mr. Bose says:—

"Similes which serve the purpose of explaining a subject may more properly be called *Illustrations*, e.g., "As wax I would not....., they are instantly lost."

In the place of this Mr. Datta has the following:—

"A simile which serves the purpose of explaining a subject is called an *Illustration*, e.g.,

(f) As wax would not....., they are instantly lost." (From a quotation).

As this is a paragraph, so we do not quote the whole thing. But it would serve our purpose all the same. We beg to draw the attention of the reader to the "(From a quotation)" of Mr. Datta. Quotation from where? Here Mr. Datta has been in a fix! All this while he has managed well because Mr. Bose has given his authorities along with all his quotations and Mr. Datta has copied them. In this case perhaps the printer's devils have ill served him and Mr. Datta has gone beyond his depth. Now I hope I have by this time been able to give my readers an idea of what Mr. Datta's idea is as to "setting forth the latest ideas."

From Mr. Bose we have:

Tautology—Tautology (Gk. *tautos*, the same; and *logos*, word) means the use of two or more words or phrases having the same or almost the same meaning, in the same grammatical situation; e.g.

Particularly as to the affairs of this world integrity has many advantages over all the fine and artificial ways of *dissimulation* and *deceit*; it is

much the *plainer* and *easier*, much the *safer* and *more secure* way of dealing with the world ; it has less of *trouble* and *difficulty* of *entanglement* and *perplexity*, of *danger* and *hazard* in it.—Tillotson.

The use of tautology is sometimes justifiable for the sake of emphasis, as the following—

The very *scheme* and *plan* of his life differed from that of other men.

Nor is any *blasphemy* or *impiety*, any *frantic* saying or *godless thought* more appalling to me, etc.—Ruskin.

Mr. Datta has given us the above in the following abridged form—

Tautology is the use of two or more words having the same meaning in the same grammatical situation, e.g., (a) dissimulation and deceit ; (b) plainer and easier ; (c) safer and more secure ; (d) scheme and plan. It is often more a fault than a figure of speech.

No comment is necessary.

From Mr. Bosc's book we have already had the following—Pleonasm or Redundancy means the use of unnecessary additional words not in the same grammatical situation. Thus, in the sentence—"They returned back again to the same place from whence they came forth,—the words *back*, *again*, *same*, *from* and *forth* are all superfluous, although they are not synonymous"..... Here follow many other examples in which we find,—"The thing has no intrinsic value in itself," "He eyed me with a look of contempt.

The following is the uptodate version of it by Mr. Datta: Pleonasm (redundancy) is the use of unnecessary additional words not in the same grammatical situation, e.g., (a) They returned *back again* to the same place *from* whence they came *forth* ; (b) The thing has no *intrinsic* value in *itself* ; (c) He *eyed* me with a *look* of contempt ; (d) *The Seagirt isle*. It is more a fault than figure of speech.

"ASYNDETON," according to Mr. Bosc, "consists in the omission of connecting conjunctions, and conducive to energy and vividness, e.g.,

I slip, I slide, I gleam, I dance.—Tennyson.

What ? not a line, a tear, a sigh,

When valour bleeds for liberty ?—Scott.

From art more various are the blessings sent,

Wealth, commence, honour, liberty, content.—

Goldsmith.

O, what a noble mind is here o'ervethrown !

The courtier's, scholar's, soldier's eye, tongue,

sword.—

Shakespeare.

Mr. Datta spares his 'no pains' in the following manner.—ASYNDETON is the omission of connecting conjunctions for the sake of energy and vividness, e.g.,

(a) I slip, I slide, I gloom (?), I glance.—(Tennyson) ;

(b) Wealth, commerce, honour, liberty, content.—

(Goldsmith).

(c) The courtier's, scholar's, soldier's eye, tongue, sword.—

(Shakespeare.)

On the head of POLYSYNDETON Mr. Bosc says—"This figure consists in the redundancy or excessive use of conjunctive particles. It serves to impart emphasis to the particulars which are enumerated."

Mr. Datta uptodates it by saying,—"POLYSYNDETON is the redundant use of connecting conjunctions for the sake of emphasising each particular," and gives all the examples given by Mr. Bosc quoted from Milton, Goldsmith and Macaulay. Nothing more, nothing less.

HENDIADYS.—By this figure, two substances connected by the particle *and* are used to convey one complex idea which might have been expressed by a noun qualified by an adjective.—Mr. Bosc.

HENDIADYS is the use of two nouns connected by the conjunctive particle *'and'* to convey one complex idea

which might have been expressed by a noun qualified by an adjective.—Mr. Datta.

This is Mr. Datta's idea of sparing no pains and making the book uptodate.

On this head both of them have cited examples. Mr. Bosc—*Life and sufferance* (suffering life).

With *joy and tidings* (joyful tidings) fraught—Milton.

Here follow four more examples from Scott, Ruskin, Milton and Goldsmith.

Mr. Datta —(a) *Life and sufferance* (suffering life).

(b) *Joy and tidings* (joyful tidings). Here follow two new examples.

We have from Mr. Bosc—

EUPHEMISM (Gk. *eu*, well ; and *phemi*, I speak)—This figure consists in softening down a harsh or disagreeable expression ; it is a way of stating something offensive in an agreeable and pleasing manner..... e.g.

He *perished in scaffold* (was hanged).

Discord fell on the music of Cowper's soul

(He became insane).

The tradesman has stopped payment (has become a bankrupt) Etc., etc.

Mr. Datta simply says—

Euphemism is softening down a harsh or disagreeable expression, e.g., (a) He *perished on the scaffold* (i.e., he was beheaded) ; (b) The tradesman *has stopped the payment* (i.e., has become bankrupt). This may also be regarded as a figure of rhetoric.

Certainly this is 'sparing no pains' with a vengeance. But we had better stop here.

We cannot refrain from referring to Mr. Roby Datta as the ideal lyricist and epic poet. At page 110 of his book Mr. Datta has held before his students a poem from his *Pictures & Songs* as a model of Lyric verse. We are glad though Byron and Shelley might shine in other skies they must not rise above the Indian horizon. And this fate awaits not the lyricists only. Mr Datta's *Epic Fragment* also should be read by our students as the ideal of epic verse.

DIHIRENDRANATH CHAUDHURI.

Vemana: The Telugu Poet and Saint, by Mr. Ram Krishna Rau. Pp. 85. Price four annas. (G.A. Natesan & Co., Madras).

The name of the poet is a household word in all the Telugu Provinces.

Ten Tamil Saints by M. S. Purnalingam Pillai, B.A., L.T. Pp. 93. Price 12 as.

Sketches of the lives, works and teachings of (1) St. Juana Sambandhan, (2) St. Manickavachekar, (3) St. Appar, (4) St. Sundarar, (5) St. Kannappa, (6) St. Karaikal Ammai, (7) St. Thiruvalluvar, (8) St. Mey Kanda, (9) St. Thayumanavar, and (10) St. Pattinaththar.

Indian's Untouchable Saints by K.V. Ramaswami B.A. Pp. 63. Price six annas. (Natesan & Co., Madras).

Sketches of the lives of Nanda, Ravidas, Chokamela and Haridas.

All these three booklets are worth reading.

Warfare in Ancient India by P. Jagannadhaswami, Pp. 45. Price 4 annas.

An interesting booklet.

MAHESCHANDRA GHOSH.

3ENGALI.

I. Kakarer Ahamkar : (the Pride of the letter Ka) : by Professor Lalit Kumar Bannerjee.

In this nicely printed little volume, the author, who is well known for his power to amuse his readers, treats us to an essay showing the various combinations in which the first consonant of the Bengali alphabet enters in current conversation and in scientific, philosophical and general literature. Of course 'alliteration's artful aid' is frequently resorted to, and the result is that the book affords us the means of spending a pleasant half an hour in its company.

II. Daridrer Krandan : (*The Cry of the Poor*) by Kadhakamal Mukherjee, M.A., Published by the Rangpur (Branch) Literary Academy. Price annas twelve.

This closely printed volume of 260 pages is intended to present a true picture of rural Bengal in its economic aspects. The author quotes Swami Vivekananda's saying that the New India of the future is to emerge from the hovels of the poor and the socially depressed, and is of opinion that India has reached the nadir of her poverty and that in her present abject material condition it is idle to expect high art, great thoughts, noble deeds and fruitful religious ideas from her. The crying need of the country, therefore, lies in the solution of her economic problems, and from personal investigation he lays down certain methods for the resuscitation of her cottage industries. The author puts in a vigorous plea for the improvement of village sanitation and holds that India must solve her economic difficulties in her own way and not as a mere imitator of the methods of the West, where the conditions are so different. Mr. Mukherjee wants to see our literature reflect the true condition of the masses of the people, their daily needs and elementary wants, for unless literature is a reflex of the real life of the people it cannot exercise that uplifting influence which is its special mission. Incidentally we are glad to learn that the author will shortly bring out a volume entitled the "Foundations of Indian Economics" in English through Messrs. Longman's Green & Co. The book before us is a valuable contribution to Bengali literature and should be widely read.

P.

SANSKRIT AND ENGLISH.

The Sacred Books of the Hindus (Nos. 74--77: Aug.—Nov. 1915) Vol. XII. Parts VI.—IX. Brihadaranyaka Upanishad translated by Rai Bahadur Sris Chandra Vasu with the assistance of Pandit Ramakanya Bhattacharya Tidyabhusan. Published by Babu Sudhindra Nath Vasu at the Panini Office, Bahadurganj, Allahabad. Pp. ii and 377—12s. Price of this part Rs. 7—8 only. Annual Subscription of the series—Inland Rs. 12—12; Foreign £ 1.

The Brihadaranyaka Upanishad is now completed. It is translated according to the commentary of Madhva, the great dualistic Vaishnava theologian. In his Bhashya, he combats the Monastic interpretation of Sankaracharya and tries to shew that his *Mayavada* is nothing but a form of the *Sanyavada* of the *Madhyamika* School. The Rishis of this Upanishad might not be thoroughgoing monists, but there could be no doubt about the fact that their tendency was towards monism. If any one could be said to have fairly represented the spirit of the Upanishad, it was not Madhva the Dualist, but Sankara the Monist.

The book is an important production, not because it is an interpretation of the Upanishad but because it expounds the views of the dualistic theologian.

Madhva, known also as Anandatirtha and Purna-

prajna, claims to be the third Incarnation of Vayu, Hanuman being the first and Bhiima the second Avatar.

Rai Bahadur Srisa Chandra Vasu successively and successfully translated the Isa, Kena, Katha, Prasna, Mundaka, Mandukya, Chhandogya and Brihadaranyaka Upanishad with Madhva's commentary and has thus greatly enriched the theological literature of our country for which we are thankful to him. The book under review is an excellent edition of Madhva's Brihadaranyaka Upanishad and is especially recommended to those who are interested in the development of the Vaishnava theology on dualistic basis.

The book contains (1) Sanskrit Text, (2) Meaning of all the words of the text, (3) English translation of the text, (4) English translation of Madhva's commentary, (5) Notes in English given by the translator, (6) Alphabetical Index of the Mantras.

The Sacred Books of the Hindus : (No. 78: December 1915) Vol. X. Part 6. Purva-Mimamsa-Sutras of Jaimini, translated by Mahamahopadhyaya Ganganath Jha D. Litt. and published by Babu Sudhindra Nath Vasu at the Panini Office, Bahadurganj, Allahabad. Pp. viii+iii+457+106+70+XIX. Price of this part Re. 5-3. Annual Subscription—Inland Rs. 12-12 as. Foreign £ 1.

The system of philosophy known as Jaimini Sutras, Purva Mimamsa Sutras or simply as Mimamsa Sutras is a philosophical defence and the exposition of the inner meaning of the sacrificial rites as prescribed in the Samhitas and Brahmanas.

These Sutras are divided into 12 Chapters which are divided into Padas; divided again into Adhikaranas or 'topics' of which there are nearly 1000.

The whole book consisting of 1,000 Adhikaranas is a voluminous work and for this reason the first three chapters only have been published for this series.

That Mahamahopadhyaya Ganganath Jha is the translator of the book, is a sufficient guarantee that it is an excellent edition of the work.

In this book the original Sutras with an English translation, padas with their meanings and an English commentary have been given.

MAHESH CH. GHOSH.

GUJARATI.

Bhilonan Git, collected by Nagri Maheshwar Pathek, and published by Krishnalal S. Vakil, B. A., Superintendent, Office of the Director of Public Instruction, Poona, printed at the Diamond Jubilee Printing Press, Ahmedabad, Cloth bound, Price Re. 1-0-0. (1915).

The Bhils are ethnologically said to represent the aborigines of India, before it was overrun by the Aryans. On this side of India they are found in large numbers in the Revakantha and Mahikantha Political Agencies and in Khandesh and Malwa. In spite of their contact with civilized people, they have preserved most of their original or rather aboriginal customs and usages in their entirety, on account of the isolated life they live in the jungles and on the hills in which these parts of the country abound. As between themselves they use a certain kind of *patois* in conversation but with others they talk Gujarati or Marathi, picking it up from their town or village neighbours. A collection of songs sung by this community was no doubt a happy idea, and the specimens collected in this book furnish very interesting reading. Almost every song is typical of the life they lead in the jungles and on the hills. Their humble fare of *Mowra* flowers, and maize, their pride in their

cattle, their simple forms of marriage and courtship, are all reflected in these songs, which also exhibit the subtle influences overtaking them on account of their constant intercourse with the outside world, as evidenced by their imitation of some of the customs and manners of a Hindu's life with its joint family system. The introduction to the collection is written in very simple and terse language, but is full of information. One remark made in it is worth noticing, viz., that the Bhils living in the jungles never tell an untruth, while those who have come in contact with civilized or educated people, cannot resist the temptation of telling falsehoods. There was no such book as this in Gujarati, and we are of opinion that it would meet with a cordial welcome at the hands of all those who would care to read it through.

Rajpadya, edited by *Munsukhlal Rajgibhai Mehta*, and printed at the *Diamond Printing Press, Ahmedabad, Cloth bound, pp. 114. Unpriced (1915).*

Rajpadya is the name given to several poems written by the late Raychandra, a Jain philosopher and a friend of Mr. M. K. Gandhi, who put him "much higher than Tolstoy in religious perception." They are poems written while Raychandra was very young, and concern *Bhakti* (भक्ति), *Charitra* (चरित्र), *Vijnan* (विज्ञान), and other cognate topics. Their chief beauty is that though they are written by one who was in his teens, still they are pregnant with spiritual meaning, and a knowledge of religion as well as of the world scarcely to be expected in one so young. The language is so simple, that one does not find it at all difficult to follow their meaning or understand them. Mr. Munsukhlal has certainly done a *वंशुकृत* by publishing them.

(1) **Shrimad Bhagavati Bhagvat**, published by the *Society for Encouragement of Cheap Literature*, and printed at the *Diamond Jubilee Printing Press, Ahmedabad, Cloth bound, pp. 892. Price Rs. 2-12-0. (1915).*

(2) **Raja Rammohan Ray**, translated by *Odharaji Tulsi-das Thakkar*, published by the same Society and printed at the same Press. *Cloth bound, pp. 215. Price Rs. 0-7-0. (1915).*

The first is a substantial volume, a popular translation of the *Devi Bhagvat*, while the second is an account of the life of Raja Rammohan Ray prepared from a Marathi Book. A larger life published by the Gujarat Vernacular Society exists, so that this book is the second of its kind.

Balakone Be Bal, by *Chandravallabhai, J. P., Khansabhai*, printed at the *Jain Printing Press, Surat, Paper cover, pp. 28. Price Rs. 0-3-0 (1916)*

This small book contains precepts and moral maxims for children. It is a useful publication.

Shri Anukramami Ramayan, by *Manibhai Khandubhai Desai*, printed at the *Muslim Printing Press, Navsari, Paper cover, pp. 74. Price Rs. 0-4-0. (1915).*

This summary of the *Ramayan* in verse was written by Mr. Desai in response to an advertisement by the last Gujarati Sahitya Parishad for condensing the epic into a certain number of verses (1000). The writer's zeal has no doubt accomplished this task, but whether the book would live or not is problematical.

Shri Mahavir Jivan Vistar, by *Pari Bhinji Harjivan*, published by *Mahji Hirji & Co., Bombay, printed at the Satya Vinaya Printing Press, Ahmedabad, Cloth bound, pp. 128. Price Rs. 1-8-0 (1916).*

These are outlines of the life of Mahavir Swami, written by a Jain, so that it goes without saying that it is written in a spirit of veneration. Its chief attractions, however, are the several pictures. Which illustrate in a prominent form the different ordeals through which the saint had to pass in order to attain the proud position he occupies with respect to the Jain religion.

Be Prem Katha, by *Chandrasekhari N. Pandya, B. A., I.L. B., Vakil, High Court, Bombay, printed at the Dharma Vinaya Printing Press, Bombay, Paper Cover, pp. 32. Price Rs. 0-3-0. (1915).*

"Two Love Stories" is the title of this thin book. As its name implies, it is just two little love stories and nothing else. Written in Mr. Pandya's usual style—neither high nor low—they are tiny, chatty affairs, like sea-foam or soft fleece, beautiful to look at, but not meant for touch or pressure. The object hidden behind the stories, in one case is to present an ideal picture of the love of a married couple and in the other to show how a wife is expected not only to read books but to manage household affairs also.

K. M. J.

In the February (1916) issue of the *Modern Review* page 230, column two, line eleven, the word "these" is a misprint for "three."

TAMIL.

Love's Triumph is the title of a short story in Tamil, priced 4 as. and published by Messrs. G. A. Vaidya Raman and Co., Madras. It narrates the story of a Brahmin girl who, unwilling to marry the boy her parents had chosen for her and whom she did not love, eludes the marriage and enters into marital relations with an old friend and relative of hers whom she loves. It would be too much to expect from writers of short stories any penetrating analysis of character or deep-laid plots which slowly unravel themselves. Nor indeed is it necessary. The present brochure is an amusing skit wherewith to while away an idle half hour of an industrious day. There is a playful humour in the work which will be appreciated by those who know the life of the Tamil Brahmins as it is lived.

S. P. T.

REPORT ON INDENTURED LABOUR IN FIJI

BY C. F. ANDREWS, M. A., AND W. W. PEARSON, M. A., B. SC.

[By the courtesy of Messrs. Andrews and Pearson we are enabled to publish this report as a special contribution to the *Modern Review*.—the Editor]

WHEN we speak in our present Report of the 'Indenture System' we have specially in mind certain features, which have been common to this form of Indian labour, ever since it was started in Natal more than half a century ago. These have given to it the name and character it bears. They may be summed up as follows :—

Recruiting of individuals in India, at the rate of forty women for every hundred men.

A five years' term of compulsory, state regulated labour.

The absence of freedom to choose or to change either employment or employer.

A minimum fixed rate of wages, which tends to remain stationary, even when the price of food rises.

The payment of immigration charges by the employer.

In Fiji we were often asked whether we had a rooted objection to 'indenture' in any form or shape. We were informed that a large number of Englishmen, all over the world, had gone out under indenture to the Colonies. These Englishmen had no objection to 'indenture.' Why should the Indian object to it ?

When the matter was brought up in this form our answer was that the whole question turned on the freedom, responsibility and intelligence of those who entered into the agreement. In the case of the European immigrant, there was a natural presumption that he understood the exact terms of the agreement before starting, and that he felt quite clear in his own mind that they were neither oppressive nor degrading. Indeed, so far were his interests safeguarded by those in authority, that in South Africa, we found, the contract itself was not valid until it had been renewed after an interval had been allowed to the immigrant to examine on the spot all the conditions. Only when he was perfectly satisfied, after

seeing things with his own eyes, was the contract finally signed. We were told in Australia that no one is allowed to come out to the Southern States except with the permission of Government. In Queensland, where European labour is badly needed, the limit that is allowed for an agricultural contract is a single year.

These facts show clearly with what care and precaution the interests of the European immigrant are safeguarded and assured. Furthermore,—and this is the chief point of all,—the contract is a purely civil one. If the European finds that the terms of the contract are not being faithfully kept, he has an immediate remedy at hand in a court of law. He knows the method by which he can get his agreement cancelled ; and if he can prove that there has been any unfair advantage taken of his ignorance, he can be quite certain of a patient and sympathetic hearing from the Magistrate, who is usually a fellow countryman of his own.

The position may be briefly stated as follows. Contracts for personal service, which are made, with ignorance on the one hand and intelligence on the other : or contracts which are brought about by the exploitation of the weak : or contracts which are engaged in for an excessively long period of years—these all tend to reproduce servile features. In these cases the new word 'indenture' is nearly equivalent to the old word 'slavery' writ large. Indeed the wish to possess such a form of labour proceeds from the same instinct—the instinct to endeavour to get the service of a fellow human being on compulsory terms.

This then is the root objection to the present Indian 'indenture.' It is neither a free, nor an intelligent contract. It is not what a business man would call a 'square deal.' It is also fixed for a dangerously long period of years, and thus is liable to lead to the abuse of individual liberty.

Other evils, peculiar to the condition of Indian recruitment, and to the character

of the coolie 'lines' in Fiji, will come up later, in this report, for examination. But the objection which has here been urged is valid against any form of indentured labour, where the contract is made for too long a period, and is engaged in under unequal conditions.

It will be best to deal first with the length of contract. It has been already pointed out how strictly limited, in the case of Europeans, the period of contract is, and with what safeguards it is endorsed. With regard to labour other than European we found on enquiry in Johannesburg that the Kaffir contracts on the Rand were usually for one and a half years. The Chinese contract, when in operation, had been for five years, but for political as well as industrial and moral causes, that form of labour had been abandoned. We would add that we did not find in S. Africa a single good word said for the Chinese indenture system. Its morals were regarded as unspeakably corrupt.

In Natal we found that the Indian indenture system with its low percentage of women and its five years' contract was still in force. We saw with our own eyes its inherent evils and there were very few indeed in the Colony, outside a small group of Planters, who were ready to uphold it. Since that time it has been practically abandoned.

In the Malay States, indentured labour was first tried on the five years' basis, but this has now been brought to an end by a joint agreement of the Government and the Planters, and a much free and shorter form of contract has been substituted for it.

We are informed by one who had full knowledge of the labour conditions in New Guinea, that in the Papuan plantations a yearly engagement had become the rule of the employers: and this produced more satisfactory results than a contract for a longer period.

In Hawaii, which is most near in its conditions of life to Fiji, the Americans, as far as we could gather, have never taken to indentured labour. They secure permanent employees by high wages and advantageous terms.

In Ceylon, the indenture system has never been in operation. Labour, in large quantities, is engaged on a monthly contract. An altogether different evil, namely coolie indebtedness, has to be combated

with, but the five years' indenture has never been tried, nor would it be acceptable to the Planters.

It will thus be seen that, in the case of immigrant labour, a contract is not uncommon. But, wherever the period of contract has been prolonged, it has led to a serious curtailment of individual liberty and to bad moral results. On the other hand, a short contract has not been open to industrial objection, while at the same time it has tended to preserve freedom.

Indeed, this special form of short contract labour (in return for passage paid) is likely to become more and more common in future, now that ocean travel has been made easier and quicker and cheaper. The flow of labour, under contract, across the ocean is only another form of the migration of labour from a congested area of population to an uncongested area, or from the villages for town factory work. One of the most interesting recent developments of such migratory labour has been the yearly transport of Italians to Argentina for harvesting purposes. Such a migration would have seemed impossible only a short time ago.

There was scarcely any subject which the Fiji planters were more eager to discuss with us than the continuance of the present term of five-yearly indenture. We listened carefully to all they had to say from a business point of view. On the other side, we stated our own invincible objection to such a long and dangerous service. Our opinion on that point had been fixed, once for all, long ago by what we had witnessed in Natal. We were understood, from the very first, both by the Government and by the Planters to be unmoveable on that issue.

Three grounds were put forward by the Planters in favour of a longer rather than a shorter contract in the case of Fiji. We felt that each of them had weight, but we felt also that the Planters' difficulties should be met in some other way than the retention of a five years' indenture.

First, they argued that the cost of the passage out to Fiji was very great. If, in the future, they were obliged to bring out whole families rather than individuals, the cost would be greater still for every unit of labour. A family could hardly cost less, in passage money, than 450 rupees. If the contract were a short one, this heavy expense would have to be

incurred again and again at very short intervals.

Secondly, the Planters urged that sugar-planting itself was skilled work. During the first six months, therefore, the labour done by the new worker was of very little value. Only after a full year, they said, could the workman be called efficient. So then, if the contract were too short, the labourer would be taken away, just as he was getting into his work.

Thirdly, they insisted with great iteration that the work itself was an apprenticeship. Only those who had thoroughly learnt modern methods of sugarcane cultivation, by working under a big employer, could hope themselves in the future to undertake profitable plantation work on their own account. They pointed out that Fiji was not like India in this respect, but rather like Java. The best Indian growers of cane, they said, in Fiji had learned their business during the five years of indenture. If they had had a shorter training they might never have learnt at all.

Such were the points which were brought to our notice with regard to the length of contract. We remained convinced in our opinion that a shorter period of training on much freer and more equitable terms would bring about as good, if not better, technical results; while at the same time the moral and social value of the greater freedom would be, even from the business point of view, very high indeed.

We would next endeavour to make plain, by illustrations from our own personal experience, how very widely the present system of Indian indentured labour differs from the free, equal and intelligent contract entered into by Europeans.

We shall best accomplish this purpose by offering examples which are chosen as typical out of hundreds of interviews with Indians in Fiji. They expressed to us, with the utmost freedom, the circumstances in which they were first led to come out to Fiji and their experiences on the plantations.

It will be seen from these what an amount of fraud and deception appears to be at work in the process of recruiting. It will be seen, also, how unscrupulous exploitation dogs the footsteps of the illiterate coolie from first to last. On

every side his path is beset with pitfalls and very few indeed escape disaster during their long five years' indenture.

In giving these examples, which came under our personal observation and were entered down in our notes on the spot, we have purposely omitted the coolies' names. In very many cases their information was given in confidence, with a request that their names should not be revealed. The peculiar state of fear that exists among Indians throughout the Islands will be explained later on. It was a common experience with both of us to have the question asked, "Are you the coolie agent sahib?" Only when that question was satisfactorily settled would conversation flow freely. Later on during our visit, when the report had spread among the coolies about our coming, we were known as the 'Calcutta-wale Sahibs' and people would come from long distances to tell us their own story.

From all that we were able to gather from the indentured coolies' own lips, and also from the free Indians, it is probably not an exaggeration to state that, in the case of 80 per cent of those who were indentured in India, some deceit was practised by the recruiting agent. This man is actually paid so much per head for his task by the Colonial Emigration authorities at 61 Garden Reach, Calcutta, or elsewhere. He is given an extra bonus for every woman. The price paid in the west of the United Provinces seems to be as high as forty-five rupees for every man and fifty-five rupees for every woman; in the East of the United Provinces and in Madras we were told the fee was lower. But whatever the price may be is immaterial; such payments made, at so much per head, for men and women, recall the worst features of the old slave system, and are quite indefensible. They offer a premium to a very low class of agents to engage in acts of cunning and fraud.

We have been ourselves into the recruiting areas of India and have questioned the villagers about the activities of these agents of the Colonial Emigration Depots. Allowing for every exaggeration on the part of those who are illiterate, there can be no shadow of doubt that the frauds already practised by recruiting agents have been immense. We found out another evil which makes this unscrupulous re-

recruiting more dangerous still. The recruiting agents represent themselves as subordinate Government officials and bring the name of Government in to set forward their own plans. The villagers are often too simple to discover this obvious fraud. Those of us who know the dread, in the ordinary villager's mind, of the power of the subordinate official, will not need to be told what an instrument of tyranny such a false representation may become. It will also be understood what a prejudice against the Indian Government itself is likely to be raised. But the evil goes still deeper. A missionary, of long experience in the villages, whose word could be thoroughly trusted in such a matter, told us that there was frequent collusion between the recruiting agents and the police, the latter receiving from the former a commission.

The recruiting agent, becoming a man of power, carries the exercise of his authority far beyond the limits of recruiting. He becomes not seldom a black-mailer whom the villagers actually bribe in order to live in peace.

A typical case of this came under our own observation. A villager, named Fakhira, had his wife and daughter decoyed from him by a recruiting agent, who offered to return them to him on the payment of a sum of money. Fakhira had not the sum ready to hand and could not borrow it. The wife and daughter were missing. He never saw them again.

We had a long conversation with a coolie, who had escaped, after being fraudulently recruited. He had been given *datura*. In this case, his mother had almost lost her reason during his absence. The small village to which he belonged was in a state of panic-fear. It is now a clearly-indicated fact that, over large areas of the United Provinces, there has been added, to the other fears of the villager this new dread of the recruiting agent. The villagers have in some districts actually banded themselves together against their common enemy, and there have been cases of violent assaults upon the recruiting agent when he has been found entering a village. Songs in the vernacular are now sung from village to village warning people against the recruiter. The situation is not altogether unlike the Mormon Scare in England, and the object of the villagers is the same, namely, the

protection of the chastity of their women and the sanctity of their married life.

It was deeply instructive to find that the actual accounts of the coolies in Fiji as to the manner of their own recruitment tallied exactly with the stories we heard from the villages in the Indian recruiting districts. We listened, as it were, to the same story from both ends,—from the fellow villagers and relations of the recruited coolies in India and from the recruited coolies themselves in Fiji.

Piecing together the different stories and eliminating exaggerations, it is clear that the recruiting agent in recent years has begun to fight shy of going direct to the villages and inducing people to come to the Depot from their own village homes. He does not bargain with them there. Nearly every coolie we questioned in Fiji said he was away from home when he was recruited. In a very large number of cases the coolie's own home people knew nothing about his recruitment. Very possibly many such coolies were escaping from justice, or running away from some family quarrel at the time. But others were clearly quite simple village people, involved in no such trouble. They had lost, perhaps, their relations in a crowded railway station. They were on a pilgrimage and did not know the way. They were merely going from one village to another, when the recruiting agent came along and tempted them with his story.

It was noticeable among the women how many were recruited at the pilgrim-centres. The common narrative was, that the recruiting agent came up, offering to take the woman to her relations, or to show her some sacred shrine, and then took her to the depot instead. The evidence given of such practices was far too circumstantial in detail, and far too frequently given with fresh detail and fresh names of places, to allow of any doubt concerning its substantial accuracy.

The following is an account of a visit paid to Muttra to gather information at first hand about up-country coolie recruiting.

We found, at the first depot, that all the coolies had been moved off to Calcutta. At the second depot, a Muhaminadan (who appeared to us a dangerous person to be entrusted with the charge of Indian women) was manager of the place. The first coolie, whom we saw, was evidently

a prostitute. Four men were also there, who told us they were ready to emigrate. One man, of very low caste, was even eager to go. He told us he had been getting only two annas a day in India. He had no idea where Fiji was, and said he thought it was about two hundred kos from Muttra. The last coolie was a woman, who was going out again to Fiji. She told us that a man had lived with her in Fiji, but had deserted her, as soon as she landed in India. Now she was all alone. No one had anything to do with her. She said that in Fiji there was plenty of money, but in India she could make no money at all. She was in a very wretched condition. Evidently she expected some other man to live with her, if she went out.

In the third depot, news of our coming had preceded us and feverish efforts had been made to get things straight. There were only two coolies. One did not appear at first, and when he came forward, he would hardly answer any question. We told the Manager to leave us alone. Then the coolie began crying and said he was in great trouble. He had been in the depot for four days and had not been allowed to go out at all. He did not wish to go away to Fiji. (When I had asked him previously before the Manager, he had said he was willing.) He implored us to take him away. We called the Manager back and told him this. He went up to the man and began to threaten him. The coolie at once got frightened. We told the manager to speak quietly, and the man then said that he wished to go away. The Manager told him to fetch his bundle and go.

We then went to see a Gaur Brahman who had gone mad on account of his wife being taken away by the recruiting agent. The whole neighbourhood collected, showing their sympathy and pity. The mad man was a pathetic sight to witness.

The news had by this time spread widely that we were in the town, and the relatives of those who had been taken away flocked round us. A respectable Jat came up to us. His brother was blind and had an only son, who was taken by the recruiters. The lad was sixteen years of age. Another boy had been taken with him, but had been rejected on medical grounds. This second boy told the blind father his son's fate. The Jat informed us that he had gone to the Magistrate and

asked for an order to stop the boy's embarkation. The Magistrate asked for a deposit of thirty rupees, which was paid, and a telegram was sent to Calcutta. An answer had come from the depot that as the boy was going by his own consent, his embarkation could not be delayed. The Jat thereupon asked the Magistrate for an order to enter the Calcutta depot. He went to Calcutta, and, as he described to us his treatment, we could understand the difficulties which were placed in his way. In the end he was informed that the boy had already sailed for Fiji. If he wished to get him back, a deposit must be made of 465 rupees.

A Hindu, by caste a Bania, spoke to us concerning his wife. She had been taken by the recruiters, and he was very bitter against them. We asked him if he had made any attempt to get her back. He said he had not, for when once she had been inside the depot she was stained.

Some correspondence was given us concerning a coolie who had been shipped to British Guiana. The following official letter is of interest:—

Sir,.....With reference to your endorsement, No. 2047 of the 4th instant, I have the honour to inform you that a sum of Rs. 531, will be required for the repatriation etc., of Radha Kishan No. 104, Mutlah 1912. (Details given). It will not be possible for Radha Kishan to return to India till about August or September 1916.

The father of Radha Kishan was a villager earning four annas a day. He told us he was going to try to borrow the money, because his son had written to him in very great distress.

It was clear from the narratives of the women in Fiji that when once they had crossed the threshold of the depot their terror became too great to allow them to turn back. The recruiting agent seemed able to stupefy them with fear. He was then able to coach them in the questions which they had to answer and they very rarely refused to reply according to his directions when the time came.

With the men folk, the methods of the recruiting agents appear to be somewhat different. Here it is the ordinary villager's cupidity which is the lever most frequently used. If he is of the stupid ignorant type, then Fiji is referred to as a district near to Calcutta where high wages are to be obtained. Incredible though it may appear, we came across many cases where

the indentured coolies informed us, with every appearance of truth, that they were quite unaware of their real destination, until they found themselves tossing and sea-sick in the Bay of Bengal.

If the villager, on the other hand, is of the more intelligent type, then the full details of the indenture are revealed. But the work is made out to be very light indeed, and the most glowing prospects are given. Nothing is said about the penal laws, or the hard conditions of compulsory labour. If the Fiji conditions were even normally fair and prosperous and wholesome, then little harm might be done by mere exaggerations. The advertisements which attract emigrants from England are often highly coloured. Yet on the whole the English emigrants are satisfied. But in Fiji the amount of satisfaction we found was very limited indeed. Here and there we discovered a set of coolies who were happy on the estates. But this was the exception, not the rule.

The recruiting agent appears not to be content with finding his recruits among the peasant classes only. He deals with all sorts and conditions of men and women. Where he finds a Sikh or a Jat, who is ready to step into his toils, he pictures Fiji as an ideal place for a soldier or a policeman, if only the thumb mark is placed to the agreement. A whole group of Panjabis was once recruited in this way, under false pretences. When they found out, on arrival, how they had been cheated they broke out into open mutiny and held up a whole district, for the time being, with fire-arms (which they managed somehow to obtain) and the trouble was not stopped until Government separated them one from another and distributed them among different coolie 'lines.'

Sometimes the recruiting agent finds a raw youth fresh from school, with a smattering of English education, and a boyish desire for adventure. He pictures to him employment in Fiji, as a teacher, on fabulous rates of pay,—if only the agreement is signed. We were startled every now and then to find in the coolie 'lines' a young lad of high caste and education, whose whole appearance showed that he had no business at all in such a place. The condition of such lads, when they arrive and have to be lodged in the same quarter with men of low morals and unclean habits of life, is pitiable indeed.

There appears to us to be a clear need for an overhauling of the whole system of recruitment in India, and for a closing of the up-country depôts. We have spoken to many of the Immigration Officers and Magistrates, in whose courts the coolies' agreements are signed, and not one has expressed himself satisfied with what is going on. Each one has told us in turn that he had suspicions of some secret fraudulent dealing, which was very difficult indeed to detect. One who had the fullest opportunity of seeing the work of recruiting in up-country districts spoke of it, in our hearing, as 'dirty work.' Our own very limited experience corroborates that statement, and the narratives we heard in Fiji endorse it. If the indenture system is abolished, and free labour to the Colonies is allowed to go on, then it is most important that such labour shall only be recruited under free conditions.

We found, further, on examination, that the agreement, which the coolie signs before going out, does not truly represent the facts of coolie life in Fiji. It is a misleading document. Not a word, for instance, is said concerning the penalties which await the coolie, if, for any reason (which he may regard as valid) he refuses to work. Another serious omission from the agreement (seeing that those who sign it are for the most part ignorant and illiterate people) is the failure to record the fact that food rates in Fiji differ materially from those in India. The coolie is told in the agreement, that he will be paid at the minimum rate of twelve annas a day. But he is not told that the purchasing power of twelve annas in Fiji is scarcely equal to that of five annas in India. He is not told, also, that more is required in the way of clothing and other necessities of life in Fiji than in India. So that the bare living expenses are nearly three times as high in Fiji as in India itself. One of the examples which follows will show what hardship this low rate of wages involves.*

The Indian woman who comes out under indenture, has a still more serious charge to make against the signed agreement. These women are simple ignorant

* It is interesting to note that the English coinage of Fiji is given an Indian value by the coolies. A two shilling piece is called 1 rupee. A one shilling piece is called eight annas. Sixpence is regularly called four annas. But this does not at all represent the true proportional value. For eight annas in India would go considerably further than a shilling in Fiji.

Indian villagers who have been used to field work. They are told in the agreement that they will have agricultural work to do in Fiji at the minimum wage of nine annas per day for a completed task. They naturally picture to themselves a state of labour in the field such as they have been used to in India. But when they get to their work in Fiji, they find that all is changed. Those who have seen the Indian woman working in the fields in India with her little family playing near her, will realise the change when she is told to leave her family behind in the coolie 'lines'. The provision of regulation 'fly-proof nurseries' is no compensation to her for the loss of the privilege of looking after her own children, and living her own natural life in her own natural way. She is not told, also, in the agreement that she will be

compelled, under penal clauses to work incessantly, day in, day out, with no time to cook her own husband's meals or look after her own children. She is never told anything also of the condition of the coolie 'lines' in which she will be compelled to live, without any privacy or even decency, for five years, with no possibility of change.

All this is hidden from the village woman who enters into the indenture agreement in India. In these circumstances, as well as others, it cannot be called a fair contract. For it is made on behalf of one party, the Fiji Government, who is fully aware of the actual state of affairs as they exist in Fiji, with another, the ignorant coolie woman, who is imagining entirely different conditions.

(To be continued).

"If a chisel is driven lightly into a board and pushed lengthwise with the grain, it picks up a shaving. This is the principle on which the swage-set rip-saw cuts. The kerf taken out by the saw-tooth corresponds to the shaving removed by the chisel. The edge *LN* of the tooth in the figure corresponds to the sharpened end of the chisel. If the edge *LN* is not sharp, the cutting efficiency of the saw is impaired just as it is with a dull chisel. Hence the necessity for always touching up the teeth of a swage-set saw with a file after they have been upset.

"If the chisel is driven deeply into the board, difficulty is experienced in pushing it along, because of the friction on its sides and because of the resilience of the wood which tends to bind the chisel. To avoid this side friction and binding, the teeth of a rip-saw of the type in question are upset or swaged so that nothing but the extreme points *L* and *N* experience any side friction. The body of the tooth and the saw-blade itself should not rub against the sides of the cut. The expert sawfiler always strives to bring the ends of the edge *LN* to needlepoints as nearly as possible.

"The best test of this condition is to place the thumb and forefinger on either side of the teeth, running them in this way around the saw. If the sensation is one of encountering small, round beads as each tooth is passed, the points are not right. The sensation should be a prickly one as the fingers slip from tooth to tooth. This will insure minimum side friction and the cleanest cut.

"The length of the chisel-edge *LN* of each tooth should be the same—that is, each tooth must be upset

the same amount, otherwise the longer chisel-edges will have to do more work than the shorter ones and the cut will not be smooth. To accomplish uniform projection of the points *L* and *N* beyond the disk of the saw is the object of using the side file. After the side file has been used, the teeth which were struck off by it should be retouched to bring them to sharpened points again."

"In the case of the cross-cut saw the action is quite different. It will be noted that the ripping process consists of parting the wood-fiber and removing shavings, such as are lifted by a chisel, even tho the kerf no longer has the appearance of shavings when ejected as sawdust. If an attempt is made to push a chisel across the grain of a board, it sticks and tears up the woodfibers. If, however, a knife is drawn across the grain, . . . no great resistance is encountered, provided the knife is sharp. After drawing the knife across the grain along two lines the short cylinders of wood-fiber between the two can be easily broken loose, leaving a channel such as that cut by a saw. If we substitute for the point of the knife the tip of the cross-cut sawtooth and for the edge of the knife the leading edge of the tooth, we see at once the action of the cross-cut saw. Alternate teeth, due to their being set to one side and to the other of the disk, shear the ends of the wood-fiber. These short cylinders of sheared fibers are then easily rasped out by the following teeth and ejected as sawdust.

"Bearing in mind that cross-cutting is a shearing process, the reason is apparent for making the outside leading edge of the tooth sharp. In order that this may be done, it is necessary to bevel the leading side of the tooth. If the tooth were ground straight

across the part *AK*, a keen-cutting edge could not be given to *OR*. The fact that a shearing cut must be made by the cross-cut saw-tooth also explains why the angle of such a tooth must be radically different from that of a rip-saw tooth. Suppose the knife were inclined in the opposite direction and it were then attempted to push it along from *A* to *B*—the point would stick and great difficulty would be experienced in forcing it through the fibers.

"One frequently sees the backs of cross-cut saw-teeth filed in imitation of the leading edge. This is wasting labor, as the back of the tooth performs no function. All it needs to do is to keep out of the way. So long as the back of a saw-tooth does not project beyond the point, it is doing everything expected of it. The extreme end of a cross-cut saw-tooth should be a sharp point, as it corresponds in the cutting action to the point of the knife-blade. So as to make certain that the edge *OK* will not touch in making the cut—as this would be equivalent to putting a broad point on the knife—a slight bevel is often given to the back of the tooth *OL*. But this is really not necessary if the front level is right."

Factory, Chicago.

The Lightning-Rod

"The lightning-rod has two functions: (1) To prevent discharges. This it does through the action of the points which permit the electricity to leak from the structure. Usually the leakage is rapid enough so that the electric charges of the cloud and the building are neutralized and a discharge is prevented. But if the charges accumulate so rapidly that the leakage from the points can not neutralize them and a stroke occurs, then the lightning-conductors (2) prevent damage by conducting the lightning-stroke current to ground. If there are no conductors forming a low-resistance path to ground, the stroke will select its own path, which will be of relatively high resistance and will probably damage the building or set it on fire.

"Damage done by lightning may be divided into two general classes—heat-effect damage, as, for example, where telephone or power-conductors or other metal members lying in the path of the stroke are fused; (2) mechanical disruptive disintegration; for example, the splitting of a tree, the breaking of a rock, or the overturning of a stack.

"Lightning seldom damages certain objects. In so far as the writer has been able to ascertain, lightning has never been known to damage seriously (1) railroad-trains or locomotives, (2) buildings with metallic-grounded sides and roofs, (3) buildings having frameworks wholly of metal, (4) grounded-steel windmill towers, (5) steel battle-ships, and (6) business blocks in cities. Apparently all of these objects conduct electricity sufficiently well for electricity induced on the earth by a cloud to be drawn up through them and dispersed by the point action before the difference of potential between the cloud and the object becomes great enough to produce a flash. If a lightning-stroke to such an object does occur, the mass of metal in it is usually sufficient to conduct the current safely to ground. Conversely, lightning often damages non-conducting objects such as country homes and barns, wooden-frame school-houses and churches, stacks, trees, cattle, and horses, particularly where the stack is near wire fences.

"The theory of the lightning-rod may be explained by reference to Figs. 1, 2, and 3. If an electrified cloud, *A* (Fig. 1), passes over any portion of the

earth, it will induce a charge of electricity on that portion. The cloud, the intervening atmosphere, and the surface of the earth really constitute a large electric condenser.

"A heavy charge will be drawn by mutual attraction to the highest portions of objects that are near or directly under the cloud. In Fig. 1, if the cloud is positively electrified, a negative charge will be induced and attracted from the earth up over the outer surface of the building shown. If the building has a metallic or other surface that is good conductor, the charge will rise (flow) rapidly. If it is of brick, stone, or wood which are only fair conductors—but they are conductors—the charge will rise (flow) slowly. It can not, however, leak rapidly, because the material of the building is a poor conductor; hence the electricity can not flow over its surface rapidly. The consequence is that the building will lie within a static field that is built up as suggested in Fig. 1.

"If the building is rodged and equipped with points as shown in Fig. 2, the charge on the building, induced and attracted by that on the cloud, will rise rapidly, and it will discharge freely from the sharp points. The probabilities are that the flow of electricity from the points will so decrease the potential difference between the cloud and the building that no lightning-stroke will occur. The presence of the grounded lightning-conductor and the points has a tendency to raise the static field above the building, as indicated in Fig. 2.

"Now if the charge on the cloud accumulates very rapidly, the corresponding charge on the building will increase faster than the points can discharge it. If it thus increase to such a value that the potential difference between the cloud and the building exceeds the breakdown value of the intervening atmosphere, a lightning-stroke (Fig. 3) will occur between the cloud and a lightning-rod point. If the lightning conductors and their grounds are adequate, the charge will be conducted to the earth without damage to the building. A building may be struck, even if it is rodged, if the charge accumulates so fast that the points will not disperse it.

"Of the materials suitable for lightning-conductors or rods, copper is probably the best, because it is a good conductor and will not corrode. Electrically, iron is also satisfactory if it is of sufficient section, but it will ultimately corrode, even if it is galvanized, and may therefore fail just when it is most needed. The contact of dissimilar metals should be avoided in a lightning-rod installation because of the liability of electrolytic action and the consequent corrosion. Some insurance companies will not accept risks rodged with iron conductor. A conductor of flat form (rectangular cross-section) appears to be preferable from a theoretical standpoint, and it is a convenient form to handle and to connect with mechanically. Practice indicates that material of any cross-sectional form will give adequate protection if it has sufficient weight per foot, that is, if it is big enough.

"In the matter of installation of lightning-conductors, the rodging must always be held in metallic connection with the surface of the building by cleats, clamps, or staples, so that an electric charge on the building's surface can readily be conducted to the points where it can disperse. Round conductor can be held with straps. . . . Flat conductor is spliced by lapping the ends and nailing a copper strap across them with copper nails. Round conductor is spliced with a sleeve."

"Conductors should be run down corners instead of over the sides of buildings, and all metallic members or fittings must be connected with them, especially if

TWO TYPES OF RIP SAW TEETH (P. 330)

The edge *LN* of the tooth corresponds to the sharp end of the chisel. To avoid side friction and binding, a swage-set rip-saw has the teeth upset as shown.

The teeth of spring set rip-saw cut exactly like the teeth of a chisel. Each tooth cuts with its point and about one-half of the edge *PO*.

EACH TOOTH IS A KNIFE-BLADE (P. 339)

The alternate teeth of a cross-cut saw break the short splinters of wood *bc* between their incisions, in the same way that they are broken between the fine-strokes *AB* and *cd* here.

THE KNIFE-BLADE CHARACTER OF THE CROSS-CUT SAW (P. 339)

The tip *O* corresponds to the knife's point, the leading edge *OR* to the blade-edge. A rounded gullet takes away the sawdust better than that shown on the right, and saves cracking of the teeth.

A test for Alcoholism. (P. 341)

HOW THE HAND OF THE DRUNKARD BETRAYS HIM. (P. 341)

These copies were made from memory after looking for ten seconds at the diagrams reproduced in the center of the page. No psychologist, we are assured, would hesitate a moment in pronouncing these copies as the work of chronic alcoholics.

Historic Apparatus of Davy in the Royal Institution. (P. 356)

Historic Apparatus of Faraday in the Royal Institution. (P. 356)

within six feet. All piping in a building should form one electric system and have substantial connection with the rodding preferably at the highest possible point. Ground-connection is especially important and should be through a hole ten feet deep, drilled into the earth and kept moist."

"Protection for telephone-wires is also essential. If it is not provided, lightning discharge current may enter a building along the wires and cause damage. The lightning-arresters ordinarily furnished by the telephone companies are of too frail construction to provide protection against a lightning-stroke of any consequence. For this service, protectors or arresters of very sturdy construction should be mounted outside the building and well grounded.

"Wire fences should be grounded at frequent intervals. If they are not, a lightning-stroke current may follow along a fence-wire and into a building and start a fire. However, the most important reason for grounding is to prevent the killing of stock during a storm the animals crowd against the fence, and when a lightning discharge strikes an ungrounded fence-wire it will seek the path of least opposition to ground, which may be through an animal near or against the fence-wire. The result is usually fatal."

• -- *The Lientield World*.

Cotton in Natural Colors

Instead of having to dye cotton, we may in future grow it in whatever color we desire. Colored cotton is already grown in various parts of the world, and we have only to assemble the colored varieties in our own country, and produce intermediate tints by interbreeding, to obtain the result suggested above. In order that this may be brought about, of course, the different colored varieties must breed true; that is, the seeds of yellow, green, or red cotton must always produce cotton of that one particular color. That this is true, and that the colors are not due to the influence of soil or other environment, have been proved by A. W. Brabham, a plant-breeder, of Olar, South Carolina.

"The production of cotton tinted by nature with any color desired is the newest and most revolutionary departure attempted in the cotton-growing industry, and one which may have far-reaching effects."

"Commercially, the achievement of natural colors in cotton would obviate the use of chemical dyes, which, besides their expense, are said to damage the fabric of the cheaper varieties of cotton-stuffs. With the perfection of the new process it would be possible to feed to the looms, to suit any design, cotton-threads colored by nature with tints which could not fade.

"The leading apostle of colored cotton is A. W. Brabham, a plant-breeder of Olar, South Carolina. He points out what is scarcely known to the general public—acquainted only with white cotton—that already there exist species of cotton of many various hues.

"Besides the white cotton of the United States, Peru produces a cotton with reddish lint; brown cotton is grown in Egypt, Peru, and Hawaii; yellow cotton is produced in China; and India has a gray cotton. In addition, a green cotton has been evolved in South Carolina, and even a jet-black cotton is said to have been developed in Mexico. C. H. Clarke, of Boston, has written to Brabham that it has proved feasible in laboratory experiments to produce a blue cotton.

"Brabham's chief contribution to the introduction of colored cottons is his proof that the different species, whether from Peru, Egypt, or China, will breed true to color in whatever soil they are planted. It was at first thought that the hues of the lint were due to peculiarities of the earth in which the cotton grew. But by experiments in South Carolina, he has established that the seed from gray cotton in India produces gray cotton wherever planted, and that the same is true of red cotton from Peru, yellow cotton from China, and brown cotton from Egypt. It is well established that white cotton from North Carolina or Texas also remains white cotton in the tropics.

"Any American experimenter may thus have at his disposal eight different hues of cotton—white, red, brown, yellow, gray green, blue, and black. According to Brabham, by interbreeding it will be possible to blend these colors into all the intermediate tints. For instance, by breeding white and red cotton together, we should arrive at a first type of pink cotton; by blending red and blue cotton we should achieve purple cotton; and the intermixture of black cotton should give us darker hues of all the other colors."

What Drives Men to Drink?

The impulse to drunkenness is disease. Men drink according to their desires—some to satisfy thirst, some because they like the taste of intoxicants, some because they crave the stimulation due to alcohol in the blood. These last are the men who drink to get drunk, and their impulses are essentially abnormal, they are diseased. This fact has been brought out with distinctness of late by mental tests made in the psychopathic laboratory of the Chicago Municipal Court by Dr. William J. Hickson, a student of the clinics at Zurich, Switzerland, where this line of investigation was first taken up and developed. "We have yet to find the first case of this kind where there is not at least a psychopathic constitution, epilepsy, dementia præcox, manic-depressive insanity, or feeble-mindedness at the basis." The habitual drunkard may know well that alcohol is a poison and that his life depends on letting it alone, but he is driven to drink by forces against which he is powerless to contend. This substratum of disease in the alcoholic has been most clearly shown, in what the laboratory authorities call a "visual-memory test," a specimen of which is given herewith. The person tested is shown certain figures for ten seconds and then asked to reproduce them from memory—an easy thing for a normal man or woman to do. Defectives can not do it.

The drawing displays the tremor of the alcoholic. But the significant thing is the fantasy, the putting into the drawing things that aren't in the original he was trying to reproduce. Fantasy of that sort means dementia præcox.

The immediate problem of the court is to find some way of dealing with this sort of man which won't make things worse than they are now. If he is discharged and allowed to go back to his family he will most certainly get drunk again, and he may kill his wife when he does. If he is sent to jail for six months his family will be robbed of his support for that length of time and he will come out in worse shape than when he went in. He won't be able to get a drunk in the jail, and that will be good for his body, but the conditions of life there are most unfavorable to dementia præcox so that confinement

will be bad for his mind--and it is his mind that is making the trouble. A six months' sentence will see him less able to do without alcohol than he is now. No amount of physical care and no amount of will enable him to escape alcohol as long as his dementia præcox endures. What he needs is light work on a farm and the society of other men. His case is probably too far gone to be cured, but social contact would do him good. Bleuler, of Zurich, used to say that he believed the reason psychoanalysis was effective in dealing with dementia præcox was due more to the fact that psychoanalysis requires frequent long conversations with a physician, which make the patient feel that somebody has an interest in him and that he has a place in the world, rather than to the special character of the psychoanalytic method--and yet Bleuler is a practitioner of psychoanalysis.

But what are you going to do with a man in the condition of this dementia-præcox case? He has no money, and there is not provision of a public institution that isn't likely to do him more harm than good.

Men of well-to-do families aren't so much better off when they become chronic alcoholics. They are more likely to be sent to a private 'cure' than haled into court by their relatives. But splendidly managed as are the best private 'cures,' they don't cure. Occasionally they may do something of permanent advantage to a patient. Usually they can do nothing more than straighten him out physically and send him back to begin over again a fight he is bound to lose. Physical treatment and care will prolong the life of a chronic alcoholic, sometimes indefinitely. But all the physical treatment in the world won't cure a psychic defect, and it is psychic defects that lie at the root of chronic alcoholism nine times out of ten, perhaps ninety-nine times out of a hundred.

It is important that the underlying basis be recognized, for until that is removed there is no hope for curing the alcoholism which our daily experience carried on for years of failure in the treatment of these cases attests.

The psychic tests are too new to have been extensively used, as yet, in determining how far moderate drinking and drunkenness are similar in their causes. It is altogether reasonable to suppose that Dr. Reid's classification will stand. The man who drinks beer instead of water or buttermilk, when he is hot and dusty, may be a fool, but he is not necessarily suffering from mental disease. The connoisseur of wines who rolls a minute quantity of a vintage on his tongue in order to get its full savor may be the victim of a perverted taste which will injure both his health and his pocketbook, but he is not necessarily suffering from dementia præcox or manic-depressive insanity. Even the man who is able to enjoy a dinner party or

a chance meeting with an old friend if his barriers of reserve are broken down with cocktails may be mentally normal. These varieties of drinking are unfortunate, so unfortunate in their effects that mankind is gradually learning to do without them. But they are not such a red flag of danger as is the presence of the desire to get drunk.

The man who wants to get drunk, will do well to search out the nearest neurologist. The probability is that the desire is born of some hidden psychic defect. Normal men do not desire alcohol in excess. It is only the abnormal who are driven to drink. --*The Literary Digest.*

Putting out a Fire with Kerosene.

For every substance, no matter how combustible there is a limiting temperature below which it will not ignite. At or below this temperature it may be used to extinguish a fire, just as if it were non-combustible. This is how a recent fire in a cotton-warehouse in America was put out by a judicious use of kerosene oil, for cotton smolders at a comparatively low temperature. But one should, "proceed with extreme care." In most cases where water is handy it would doubtless prove to be a safe and efficient substitute for the kerosene--at any rate in any place but California, the land of wonders. For those of our readers who have started hundreds of fire in kitchen stoves and elsewhere by an application of kerosene, brief account of its successful use as an extinguisher should have especial interest.

What would you think if you got a hurry-up call for kerosene to put out a fire? Probably you would request a repetition of the order, thinking you had not heard aright, and when it was repeated without change you would feel justified in concluding that some one was mentally off balance or attempting a practical joke. But that would be because you never lived in Calexico, Cal., the metropolis of Imperial Valley, and by the same token knew nothing about cotton in the bale.

A cotton-bale has been subjected to a very heavy pressure; water will penetrate it but an inch or so, whereas kerosene will go clear to the center; a fire in a cotton-bale does not blaze, simply smolders and eats its way into the bale; at the comparatively low temperature at which cotton burns, and where is no flame, kerosene does not ignite, and that's the explanation. After the fire is extinguished the hands are removed from the bale and the burned portions of the cotton stripped off. It is said that the use of kerosene has practically no detrimental effects on the cotton, and after it has been spread out and aired for a few days all odor of the oil disappears.

--*The Literary Digest.*

PHALGUNI

A MUSICAL PLAY BY SIR RABINDRANATH TAGORE.

'**P**HALGUNI' is the name of a month, the month which heralds Spring. *Phalguni* stands for that rejuvenation of India which is being heralded by the sweet *kokila* voice of Rabindranath. Fully

to appreciate the play you need to be yourself in the spring-time of the spirit into which India is wonderfully emerging.

The *Vairagya-sādhana*, the prelude of the play, gives you a key to its symbolism.

The *Maharaja* is disconsolate, for the first grey hair has arrived. His winter has begun: summer has gone, he thinks, for ever! The minister is not equal to the novel situation. The inevitable priest is sent for and he counsels of course renunciation and inaction, and exploits the occasion for securing numerous valuable gifts for himself. The Minister is perplexed beyond patience, for there is a sore famine, and administrative problems are heavy, and need immediate attention. At this crisis comes the Poet with the message of hope and joy of Spring ahead of every Winter, of the victory of life and activity over the deadening grasp of a belated past. He offers to enact a play before His Majesty to demonstrate his message. *Phalguni* is the play.

The four scenes of the play are each introduced by a musical prelude, wonderful in colour and sound and joy, which represent the quick and marvellous transformation of decrepit dead Winter into the graciously joyous living Spring. The warm Southern Wind is a necessary character. The Bamboo sings:

O South Wind, O Wanderer, push me and rock me,
thrill me into the outbreak of new leaves.
I stand a-tiptoe, watching by the wayside to be
startled by your first whisper, by the music
of your footsteps, a flutter of joy running
through my leaves, betraying my secret.

Then a Bird rocking in its branches
sings:

The sky pours light into my heart, my heart
repays the sky in songs

I pelt the South wind with my notes,

O blossoming palash (flame of the forest) the air
is afire with your passion, you have dyed my
songs red with your madness.

O Srish, you have cast your perfume nets wide in
the sky, bringing up the heart into my throat.

The Champak sings:

My shadow dances in your waves, everflowing river,
I, the budding Champak, stand unmoved in the
bank with my vigil,

My movements dwell in the stillness of my depth,
in the delicious birth of new leaves,
in flood of flowers,
in unseen urge of life towards the light;
its stirring thrills the sky, and the
silence of the dawn is mov'd.

But the hoary Winter is still about and
he must be dwelt with squarely. A crowd
of jolly youngsters set on him with a
boisterous song—

We are out seeking our play-mates, waking them
up from every corner before it is morning.

We call them in bird-songs, beckon them in trem-
bling branches, we spread our enchantment for
them in the sky.

You shall never escape us, O Winter!

You shall find our lamp burning even in the heart
of the darkness you seek!

Venerable old Winter would fain be
let alone:

Leave me, Oh, let me go.

I am ready to sail across the South Sea for the
frozen shore

Your laughter is untimely, my friends, you weave
with my farewell tunes your song of the new
arrival.

But the crowd is insistent:

Life's spies are we, lurking in all places.

We have been waiting to rob you of your last
savings of dead leaves,

Scattering them in South Winds.

We shall bind you in flower chains
where Spring keeps his captives
for we know you carry your
jewels hidden in your grey rags.

And they tease him:

How grave he looks, how laughably old,
how seriously busy with the preparations of
death!

But before he reaches home we will change his
dress and his face shall change.

We will confound his calculations, snatch away
his bag, bulging out with dead things,
and there shall be unveiled the reckless and the
young in him.

O the time comes, it has come,
when he shall know that he is our own, when
the mad torrent shall be unloosed from the
misery grip of the ice, and the north wind in its
ring dance shall turn round.

O the time comes, it has come,
when the magic drum shall be sounded,
when the sun shall smile at the change of your
grey into green.

All on a sudden the old man is attack-
ed, his ancient trappings and grey beard
and hoary hair are torn off. A fine athletic
young man emerges. He is staggered at
the new aspect of the same old world of
his. "O, who are you?" he asks. "I
am Vakul!" "Indeed! and who are you?"
"I am Parul." "And who are these
others?" "Why we are Mango-blossoms
landed on the shore of light." And so
forth. They are the same old-time friends
of his, but what a change in them now,
with life quivering forth in every branch
and leaf into bud and blossom, into scent
and colour! So are also his old feathered
friends transformed! He realizes his
failure.—He had sought Death and pursued
it steadily, but behold he has crossed the
portal into a new youth.

"Do you own defeat at last at the hand of the
Hidden life?"—"Yes!"
"Have you, in the end, met the Deathless in
Death?"—"Yes!"
"Is the Dust driven away that steads your City of
the Immortal?"—"Yes!"

Interwoven in this beautiful musical setting is the Play itself. Full of action, humour and beauty as it is, it is really profound in its symbolism. Until the author himself gives the interpretation to the world, it is the privilege of the student to construe the parable according to his own lights.

The four scenes are named, Outburst, Search, Doubt and Discovery. In the life of a people as in that of an individual there comes a day when there is a sudden manifestation of great stirrings within, an unrest, a gnawing dissatisfaction with things as they are, a desire for something of life that is more abundant, more real, more satisfying. This feeling though vague, is nevertheless strong and real. This is the *Outburst*. In this stage the wise saws which answered hitherto are found ridiculous in their trite vacuity. The day for them and for the professional mentors who traded in them is past. But there is as yet nothing to take their place.

The true wisdom of the Ancients must be rediscovered. It led them to such marvellous achievements in every line of effort then available to the thinker and the ruler. That light has been shivered by sects and parties, obscured by the compromises of worldly-wise charlatans, discoloured by self-seeking professionals. The thing is to rediscover the original *Shekinah*, pure and self-effulgent, uncontaminated by any media. Hence the *Search*.

But how is this Search to be accomplished? Surely the place to seek is among the Ancients. It was there and should be there still. Let us turn our steps backwards and go into those dark recesses where it must still be hidden. The essential spirit of the new Outburst however is not convinced. It feels that the *Shekinah* must be perennially with men, and that the very Outburst is due to its undying workings within. And so the quest is launched in perplexity and after an uncertain lead.

The conventional guides are of no avail. They know nothing of realities. They are still at the level of the platitudinous wisdom of the professional, which the seekers have discarded as ridiculous. The

quest must therefore proceed unaided and with independent effort. It becomes long and wearisome, perhaps desperately depressing, before a discovery is made. A new light is revealed in the symbolism of the *Blind-singer*.

Blindness has given him the advantage of freedom from the distractions and trivialities of life. His "inner eye" is all the brighter. "He sees with his all." And he sees beneath and beyond, perceives the essential unity of past and present, and indicates the direction where the object of the quest is to be sought. The most heroic spirit among the seekers ventures on the lead, plunges into an untrodden cave, and discovers the *Ancient* who does bear the *Shekinah* of the quest. The Ancient is brought into full view and lo, who is it, but the *Eternal Youth*, the Spring-spirit of their own Outburst! The realization of this discovery means unbounded joy, and it is expressed in a classic scene, where all the actors join in a final chorus:

Come and rejoice! for April is awake.
Fling yourselves into the flood of being,
bursting the bondage of the past.
April is awake.
Late's shoreless sea is heaving in the sun before
you.
All the losses are lost and death is drowned in its
waves.
Plunge into the deep without fear with the glad-
ness of April in your blood.

In this chorus we recognize one of the greatest truths in which the Poet voices the spiritual renaissance of India. We recall the now world-famous stanza of the *Gitanjali*.

Leave this chanting and singing and telling of
beads
Whom dost thou worship in this lonely dark
corner of a temple with doors all shut?
Open thine eyes and see, thy God is not before
thee!
He is there where the tiller is tilling the hard
ground and where the pathmaker is breaking
the stones:
He is with them in sun and in shower, and his
garment is covered with dust.
Put off thy holy mantle and even like him
come down on the dusty soil:
Deliverance! Where is this deliverance to be
found?
Our Maker himself has joyfully taken upon Him
the bonds of creation: He is bound with us
all forever.
Come out of thy meditations and leave aside thy
flowers and thy incense!
What harm is there if thy clothes become tattered
and stained?
Meet Him and stand by Him in toil and in sweat
of thy brow.

It is not renunciation and inaction, but joyous service in the work-a-day world that conserves the undying freshness of the spirit, whether of an individual or of a people.

Phalguni has another great Truth too to tell us children of Mother India. How ardently we desire the heyday of Spring for our country. But Spring is not born of the Sea or the Sky. Spring is in the bosom of Winter. True Spring is utterly unspeakably different in many ways from Winter. Nevertheless Spring emerges from Winter and from none else. "Who are you?" I am *Vakul*. The wonderfully scented stars now falling from the *Vakul* tree imply the conserving, the strengthening, the sustaining influences of hoary Winter on the tree as it stood through the weary depressing months stolid and sober

with darkened leaves and scragged bark. The India that is to be, *must* come out of the India that has been. Ancient India can never be New India, any more than Winter can be Spring yet. It is equally true that New India can never issue but from the loins of Ancient India. New forces, strange agencies do and will have to operate, some of them of infinite power such as that of the *Phalguni Sun* (for does not 'Rohi' mean Sun). The deadening grasp of the belated forces must be rent asunder with more or less violence. Suffering is inevitable in the critical stages of the metamorphosis, but it is the suffering of the birth-pang, and does not lessen the certainty that in the great essentials of being there must be a real continuity.

K. T. PAUL.

THE MAIDEN'S SMILE

TRANSLATED BY SIR RABINDRANATH TAGORE
FROM A BENGALI POEM BY DEVENDRANATH SEN.

Althinks, my love, in the dim daybreak of life, before you came to this shore
You stood by some river-source of run-away dreams filling your blood with its
liquid notes.

Or, perhaps, your path was through the shade of the garden of gods
where the merry multitude of jasmines, lilies and white oleanders
fell in your arms in heaps and entering your heart became boisterous.
Your laughter is a song whose words are drowned in the tunes, an odour of
flowers unseen.

It is like moonlight rushing through your lips' window when the midnight moon
is high up in your heart's sky.

I ask for no reason, I forget the cause, I only know that your laughter is the
tumult of insurgent life.

MY OFFENCE

TRANSLATED BY SIR RABINDRANATH TAGORE
FROM A BENGALI POEM BY DEVENDRANATH SEN.

When you smilingly held up to me, my sweet, your child of six months, and I said,
"Keep him in your arms,"

Why did a sudden cloud pass over your face, a cloud of pent-up rain and hidden
lightning?

Was my offence so great?

When the rose-bud, nestling in the branch, smiles back to the laughing morn,
is there any cause for anger if I refuse to steal it from its leaves' cradle.

Or when the *Kokil* fills the heart of the spring's happy hours with love-dreams
am I to blame if I cannot conspire to imprison it in a cage?

INVINCIBLE

O Fate ! between the grinding-stones of pain
 Tho' you have crushed my life like broken grain,
 Shall I not leaven it with my tears and knead
 The bread of Hope to comfort and to feed
 The myriad hearts for whom no harvests blow
 Save bitter herbs of woe ?

O Fate ! upon the threshold of my trust,
 Tho' you have trod my spirit into dust,
 Shall not my dust reblossom like a grove
 To shelter under burgeoning boughs of Love
 The myriad souls for whom no gardens bloom.
 Save bitter buds of doom ?

SAROJINI NAIDU

Hyderabad, Deccan.

INDIAN PERIODICALS

Under the heading

The Study of Indian Art

Mr. O. C. Gangoly contributes to the *Hindustan Review* for January an article which is refreshing in its candour and truthfulness and which should prove useful to the Indian and foreigner alike in understanding and appreciating Indian Art. Mr. Gangoly is well-known as an art critic of no mean calibre and he deserves to be heard.

The following observations on the modern educated (?) Indian and the European savants who take an interest in Indian artistic productions, though verging on the caustic are nevertheless justified. Says Mr. Gangoly :

As one of the results of the denationalizing process that has been at work for the last decade the modern educated Indian has lost all pride in or even capacity to understand the magnificent achievements of his own people in any sphere of life,—be it in the field of letters, commerce, industry or art. The educational system of this country has been founded on assumptions which have engendered the belief that there was nothing deserving of attention in

the ancient and hereditary culture of the land which should be preserved, continued and developed. This has helped to a great extent, to the cultivation amongst our educated brethren, of a strong sense of depreciation of all that appertains to the cultural history and civilization of India. It has become an unfortunate characteristic of the contact between the East and the West that the value of Oriental civilization has been supremely discounted. Some European *savants* have taken a sort of an amateurish interest in the study of Oriental culture and have attempted to appreciate the masterpieces of Indian Literature and Philosophy and to appraise their value by the touchstone of scientific criticism. But this study has been the hobby of a very limited few who are themselves looked upon by their countrymen as cranky and outlandish in their tastes. When we come to examine the nature of this study itself we find that even this does not go far enough, being exclusively confined to the philological, anthropological and historical branches of indology. The fixation of the date of the Indian epics seems to be of greater importance than the appreciation of the cultural value of their contents. Scores of lengthy articles have appeared on the "Date of Kalidasa" but the study of the poetry of Kalidasa has never been awarded a place in European culture.

The writer goes on to say that

The *Indianness* of Indian culture makes no appeal to our European Pandits. They find it difficult to

and stand, appreciate or sympathize with standards different from their own. And it considerably tickles their vanity and self-complacency to believe, that *the world has nothing new to learn from the records of Indian civilization.*

Indian culture whether relating to pictorial art or literary draws admiration only where it has points of similarity with similar European productions. As an instance in point the writer cites the appreciation in England of the poetry of Rabindranath Tagore.

Apropos Sir Rabindranath's welcome to the literary coteries of England it will be useful to quote a few passages from the *Times' Literary Supplement* (May 15th, 1914) which make revelations of a significant character regarding the value of this welcome and appreciation:—"There was another element in that welcome which was not quite so obvious, there was one of a company (Sir Rabindranath Tagore) that turned even more earnestly to Christianity than to the Upanishads. Rabindranath Tagore is and remains a significant figure. He leads to a re-statement of the teachings of Christ." So, Sir Rabindra's works are deserving of appreciation not because it introduces to the literature of the world a novel spiritual temperament and a new flavour added from the Indian Garden, but because they have constant resemblances to the teachings of Christ, to the psalm of Job and the Song of Solomon, *i. e.*, because of their points of similarity and not on account of their specialities. Similarly the Gandharan Sculptures attract the European mind because it is less Indian in character and type and being an illegitimate offspring of Greek and Roman art-traditions are reminiscent of familiar art-forms.

This attitude of mind, this unwillingness to follow, grasp or understand the specialities of Indian civilization is nowhere better illustrated than in the department of archaeology and the methods and preferences by which the ancient remains of India are studied. In this anxiety to take stock of the un-Indian features of the hands the official archaeologist hardly if ever leaves any opportunity to himself to recognize and study the characteristically Indian features of these remains or to appraise their artistic value. The so-called similarity of Mauryan pillared-hall to the Persepolitan work of the time of Darius Hystaspes looms so largely in his mind and dominates his judgment that he is unable to distinguish the Indian elements which govern Mauryan Art. For a like reason he must necessarily turn his back against the masterpieces of Hindu Mediaeval Sculpture—for they do not conform to the formularies of the Greek and Roman art-canon,—they must therefore be brushed aside as ugly, fantasmique or monstrous.

Every sane lover of art will readily admit that

In order to fully appreciate and correctly apprehend the meaning and the value of the art-productions of a foreign nationality, it is necessary as much as possible to approach the subject with the eyes of the people themselves for whom they were originally created. Even the so-called special or local elements of a work of art may themselves constitute the very new lights or qualities by which the art of the world is destined to be enriched. In the foreign student of Indian Art I would offer

the suggestions which the late Sister Nivedita made to the student of Indian religious ideas: "If you desire to understand a religious idea, reproduce as perfectly as you can in every detail the daily life of the man to whom it came or the race to which it was familiar. To understand the Buddhist Bhikku go out and beg. To understand Aurangzeb, sit on the mosque at Delhi and pray the prayers of the Mahomedan."

For ages past the connoisseurs of the West have grown up in the belief that ideals and standards of artistic expression have once for all been found and determined by the ancient Greeks and have been established as the universal criteria by which the art-productions of all races and in all times must be studied and measured. It may be doubted if any system of aesthetics can be adopted as final. For after all aesthetics are founded on the achievements of the artists and a fresh manifestation in art may upset all philosophical calculations. And this has been nowhere better illustrated than in the modern appreciation of the art of the Far East. The art of Japan was the first to open this sealed book to the Western world, and to the hitherto accepted ideas of fine art and the artistic canons of Europe based on Greco-Roman traditions, the revelations of Japanese art-forms came as a great and unexpected shock. Students and connoisseurs immediately set out to explore the unknown realms of Eastern aesthetics and found that they must necessarily revise their ancient theories of art which they had fondly believed to be final, and the admission has come slowly though reluctantly that the art of Japan and the other eastern countries, though not answering to the Greco-Roman tests, stands high as fine art as any art of Europe.

But the study of Indian Art from its own point of view has yet to begin.

India and Illiteracy.

Mr. S. M. Dikshit, who was an unfortunate victim of the recent *Persia* disaster collected the following interesting statistics of illiteracy which were sent to us for publication along with many other journals:

WORLD STATISTICS.

Percentage of population over 12 years of age unable to read and write.

Country.	1840	1870	1900.
Germany . . .	18	4	1
Norway	3	1
Sweden . . .	20	3	1
Switzerland . . .	20	5	1
New Zealand	7	4
France . . .	53	15	5
United Kingdom . . .	41	10	6
Australia	9
Holland . . .	30	14	10
United States . . .	20	13	10
Belgium . . .	55	20	12
Austria . . .	79	45	31
Italy . . .	84	53	44
Spain	68	..
Russia in Europe . . .	98	85	78

(Quoted in the Encyclopaedia of Social Reform, mainly from Pearson's "Civilization Table.")

The following figures relate to Asia and Oceania :—
Population over ten years.

Ceylon (All races)	...	78.3	All ages	1901
Ceylon (European races).	...	11.9	"	1901
Ceylon (other than European)	...	78.1	"	1901
India	...	92.5	Population over ten years	1901
Philippine Islands	...	55.5	"	1903
Russia in Asia	...	87.3	"	1897
Hawaii	...	36.3	Population over six years	1896
American Negroes	...	30.5	Population over ten years	1910

(Quoted from American Cyclopaedia of Education.)

From the above it will be seen that, as regards illiteracy India possesses the unique distinction of occupying the first place!

in the *Young Men of India* for February Rev. J. C. Winslow introduces:

The Poetry of Narayan Vaman Tilak

In English Garb.

"The name of Narayan Vaman Tilak," we are told, "is famous in Western India, and deserves to be more widely known. Several volumes of his poetry are now to be published. At present one only has appeared, dealing with a variety of subjects of a general kind. The translations below are taken from this volume."

THE POET'S SUPPLICATION

Reader, behold my heart laid bare,
And freely plant thy dagger there;
Yet on these poems—ah! forbear—
Though ne'er so soft the hand thou place,
Nor tricked with ne'er so deft a grace,
That lightest touch
Is yet too much!
Sweeter were death to poet heart
Than profanation of his art
For mark thee well, these songs I sing,
Nor mine nor thine their secret spring:
Bethink thee at Whose quickening
These fires upstart
Within my heart,
Ay, in that Presence trembling stand,
Then, if thou dar'st, stretch forth thy hand.
See on those clouds how sunset throws
Chance tints, nor plan nor order knows,—
Thence all their charm!—You rambling rose
Counts not her flowers,
But in random showers
Droops and trails them with ne'er a thought!
Ever such is true beauty's sport.
Worship or scoff! yet draw not nigh
This sacred revel of poetry
See, with clasped hands, with suppliant sigh
I beg, I pray,
Conjure thee—nay,
Prone in the dust thy feet I kiss,—
Touch not my songs! I ask but this!

A RIDDLE

There is a plant grows in the soil of Pain—
Guess ye its name?—that drinketh tears for rain,
And climbs most swiftly skyward when the rays
Of Separation's sun all fiercely blaze.
There is a potion—can ye name it true?—
At taste whereof dead men gain life anew,
Dumb lips break forth in music past compare,
And blind eyes open on visions heavenly far.
There is a spell so strange—guess yet again—
It shows men frenzied, though in heart most sane,
Its mystic wisdom leaves not "thou" nor "I,"
And he who plumbs its secret scales the sky.
Guess ye my riddle—what is this so fair
That, where it blossoms, God is always there?

'PREMSAMADHI' or THE BURIAL OF LOVE

Ah love, I sink in the timeless sleep,
Sink in the timeless sleep;
One Image stands before my eyes,
And thrills my bosom's deep;
One Vision bathes in radiant light
My spirit's palace-halls,
All stir of hand, all throb of brain,
Quivers, and smokes, and falls.
My soul fires forth, no fetters now
Chain me to this world's shore.
Sleep! I would sleep! In pity spare;
Let no man wake me more!

Art and Education

In the course of an article in the *Crucible* Mr. Kundan Lal tries to explain the supreme position of Art as an educator. Says he:

If we wish to teach something to a person we teach him in the language that he understands. We cannot teach history in Chinese to a young Persian boy. When we desire to teach more than one person we must do so in a language that is understood by all of them. Similarly if we have to teach something to many nations we must teach in a language that is understood by all those people. Thus, you will readily admit that the more universal the medium in which a knowledge is sought to be conveyed to the people the greater is its educational value. Leonardo da Vinci, an Italian genius and archetypal forerunner of the modern European civilization once said that that branch of human activity should occupy the more important place in the scheme of evolution the fruits of which are more universally comprehensible, and conversely, that science which is communicable to the least has the least significance in that scheme.

Which is the language which is most universally known? The language of nature. When man cries you know that he is in pain even though you be an Indian and he a Hottentot; if you are in France and you see the trees shedding golden leaves you know it is autumn there though you speak no French: when your mother looks at you in a certain way you know she loves you even though she may not tell you so. It is a certain change in the curvature of her eyelids and a peculiar light in her eyes that betrays her emotion, but it is very probable you received the sensation without knowing what it was in her eyes that conveyed it to you. This language of nature is the language of art. By this you must be careful not to think that art is the imitation of nature. No,

art in this respect is identical with nature. The artist does what nature does. The artist uses—sometimes, but always—the forms that are found in nature, and as far as you may say he imitates nature, but then these forms are merely the materials in which the artist moulds his thoughts. The artist draws and colours to display an emotion in its depths. The artist never paints a tree. It is always the light on the tree that he wishes to display.

We said that the facts of nature being the same all over the world, and the thoughts of an artist being expressed in terms of nature, are the most universally understandable. Now, if you admit that the more rivers of a medium for education the greater is its life, you will also have to admit that there is no other language that can compete with that of art in that respect.

Art alone is a mode of expression that is both universal and constant in time. From generation to generation, and century to century and to every continent on the earth a figure on paper, or an image fashioned out of stone demonstrates the philosophy and the poetry of a culture in a form physically visible, and needing no other interpretation but that of a sympathetic eye and an æsthetic culture which do not differ according to time or geography. Here let us recall that there is no greater falsehood than the pernicious saying that the appreciation and interpretation of art is a matter of personal judgment or opinion. No, the success of art depends upon success with which the dreamer, and you so often are, the harmony and rhythm of nature revealed by it. Art points out the way that nature is trying to follow—the evolution of matter to suit the evolution of the spirit, and it is quite possible that only art and never nature be able to do it in a physically visible state.

The following observations of the writer explain why the partial suppression of the form of a painting is necessary to reveal the underlying soul of the picture.

A mere historian writing of Shri Krishna that he would never be able to portray him faithfully, the historian will make him a figure of flesh and blood, a wonderful incarnation, yet still living on earth and in time, but not the eternal spirit that lives in the consciousness of a Vaidhva, he is never imaged in the emotions of the Bhaktas, he is a conception of the collective psychological and religious yearning of the people. The painter in his rhythmic lines and the lights and shadows of his symbolic colours, the sculptor in the angles of his stone and the balance of his curves, and the writer in the poetry of his words tell more than the mere delineation of a tall and feature, or the meaning of a mere word, can ever convey.

In a *ragini* a particular emotion is conveyed not by the words of a song but by the rhythm, the time, and the melody of the music. Musicians will tell you that words count for little in a *ragini* and so painting and in sculpture the face and the features are merely the material for the expression of that which the Hindu artists call the *Rasas* (roughly speaking emotions and feelings). You can no more represent an emotion in prose or portray man through photography than describe music by words.

In concluding the writer establishes the superiority of art as a medium for knowledge.

Mr. Walter Pater says in one place that the service of philosophy, of speculative culture, towards the human spirit is to rouse, to startle it into sharp and eager observation, and to bestow on it great passions which may give it a quickened sense of life. Art is the most potent magic that can be used to rouse people from lethargy, to stir up their emotions, or to wake in their breasts memories of the past, to make them conscious of the present or ambitious for the future.

In the course of an erudite article published in the January number of the *Arya*, dealing with the

Ideal of Human Unity

we read the following observations about the possibility of destruction or other wise of the nation and the empire.

The nation is a persistent psychological unit which Nature has been developing throughout the world in the most various forms and educating into physical and political unity. The political unity is not the essential; it may not yet be realised, but the nation persists and moves inevitably towards its realisation; it may be destroyed, but the nation persists and travels and suffers but refuses to be annihilated. In former times the nation was not always a real and vital unit, the tribe, the clan, the commune, the tribal pool were the living groups. Therefore those nations which in the attempt at national evolution destroyed these living groups without arriving at a vital nationhood, disappeared once the tribal or political unit was broken. But now the nation stands as the one living group, unit of humanity into which all others must merge or to which they must become subservient. Even old persistent race units and cultural units are powerless against it. The Catalans in Spain, the Breton and Provençal and Alsatian in France, the Welsh in England may cherish the signs of their separate existence, but the attraction of the greater living unity of the Spanish, the French, the British nation is too powerful to be repelled by these persistences. For this reason the nation in modern times is practically indestructible, unless it dies from within. Poland, torn asunder and crushed under the heel of three powerful empires, has ceased to exist; the Polish nation survives. More than forty years of the German yoke remain faithful to her French nationhood in spite of her minorities of race and language with the exception of Alsace. All modern attempts to destroy by force or break up a nation are foolish and futile, because they ignore this law of the natural evolution. Empires are still perishable political units; the nation is immortal; and so it will remain until a greater living unit can be found into which the nation idea can merge itself obeying a superior attraction.

And then the question arises whether the empire is not precisely that destined unit in course of evolution. The mere fact that at present not the empire, but the nation as the vital unit can be no bar to a future reversal of the relations. Obviously, in order that they may be reversed the empire must cease to be a mere political and become rather a psychological entity. But there have been instances in the evolution of the nation in which the political unity preceded and became a basis for the psychological as in the union of Scotch, English and Welsh to form the British nation. There is therefore no insurmountable reason why

a similar evolution should not take place and the imperial unity be substituted for the national. Nature has long been in travail of the imperial grouping, long casting about to give it a greater force of permanence, and the emergence of the conscious imperial ideal all over the earth and its attempts, though still rude, violent and blundering, to substitute itself for the national, may not irrationally be taken as the precursory sign of one of those rapid leaps and transitions by which she so often accomplishes what she has long been gradually and tentatively preparing.

Guru Nanak's Message

pened by T. L. Vassian and appearing in the *Sikh Review* for January is an eloquent piece of contribution clothed in beautiful language. For the benefit of our readers we call the following from the article under notice:

What is the Glory the Lord beholds in all that is? Men often think their glory consists in the exercise of the power they possess.

There be not a few of the world's kings, generals, warriors, statesmen who have thought so and interpreted glory in terms of power, dominion, conquest. Not unoften even little men dressed in brief authority show their glory by exercising their little power.

The Lord's glory is not shown forth by power which often means the suffering of many and the passing pleasure of a few: the Lord beholds His Glory in His *perpetual sacrifice* for the Universe. So many worlds, so many planets, stars, systems, may

we not regard them as the Lord's self-offering on the plane of manifestation? May we not say the Universe is the self-giving,

The Self-Oblation of the Lord?

so we read in the Bhagavad Gita that the world is a fragment of the Lord's own Self. In starry skies, in all the wonders of the world, everywhere, in every place the Lord beholds the Glory of His perpetual Self-giving. This sacrifice, self-giving involves no pain: sacrifice is painful to us because we are often reluctant to give up for another what we have appropriated for ourselves. We are often selfish, grasping and so sacrifice involves effort, struggle, pain. The Lord's sacrifice is Joy: His self-giving is an overflow of His Eternal Joy. Many there be who pass by the wondrous forms of Nature-beauty, but let an artist gaze at the glory of the sunrise or sunset, the mountain height, the midnight moon, the sea, and skies; he cannot keep the vision to himself; he needs must express it. The universe is an expression of the Joy-vision of the Lord, Himself the Lord of Life and Joy.

He builds up finite centres of consciousness

to share with us His Life and Joy. Therefore do we adore Him as Love.

If you be a seeker of the Light, fling yourself in joy on the pathway as the King in His Beauty passeth by, and in your self-giving will the Lord behold His Glory and with His blessed Hands will He raise you from the dust, and into your life, emptied thus of self, He will breathe His Breath divine and through you shall a wondrous melody flow from soul to soul and star to star and the master's Joy shall be yours.

FOREIGN PERIODICALS

In the course of an eulogistic short notice of the

Poems of Ralph Hodgson

the *Times* says:

In these dark and anxious days we realize as we may never have realized before that poetry is not a luxury but a necessity. For many it has proved a true encouragement and consolation. The unrelaxed strain (of reading) of the horrors of war gradually closes in the mind and curtains its windows. Like any personal and circumstantial danger or difficulty, it may become an obsession. And every obsession imperils true sanity and restricts freedom of action. Patriotism itself cannot live and flourish in any air but that of the imagination. The best things of life, all that is generous and beautiful, and unearthly and enduring, are things of peace.

Poetry—certainly dramatic and lyric poetry—is itself a form of action. It is the outcome, the revelation, of those rare moments when life's every energy is concentrated upon a single issue. No true poem

was ever written in cold blood or out of an empty heart.

In interpreting Ralph Hodgson's poetry the *Times* says:

There is a poetry in which the words themselves have almost the force and efficacy of deeds. They seem to have been fused into their places by the intensity of thought and feeling of which they are the expression. There is no violence, no overemphasis, for these are symptoms of a dissipation of energy. The man in earnest never wastes. His speech is as clean and incisive as a blow. It is this forcefulness, this clean-cut insistency and onset that are the conspicuous marks of the poetry of Mr. Ralph Hodgson.

His "complete works" would go into a small volume. An early collection of verse was published some time ago. And a year or two before the war appeared a series of four little chapbooks, bound in mustard-colored and gray wrappers, with drawings by Mr. Lovat Fraser (price sixpence plain and two and sixpence colored), and privately published, so to speak, at the Sign of Flying Fame. These have lately been reissued from the Poetry Bookshop; and two of

them, "The Bull" and "A Song of Honor," were "crowned" last year and won the Polignac Prize presented by the Academic Committee of the Royal Society of Literature.

In the words of Hodgson "A song of Honor" is:

The Song of courage, heart and will
And gladness in a fight,
Of men who face a hopeless hill
With sparkling and delight . . .
From men whose love of motherland
Is like a dog's for one dear hand,
Sole, selfless, boundless, blind.

That is the primary acceptance of this poetry. It does not argue, it does not dissect or explore or teach or attempt to criticize life, or to do anybody any particular good. Beauty is its impulse rather than its goal; truth the road it treads. And its effect is as downright and straight-forward as that of a formidable nose in a vigorous face, the sparring attitude of a fearless young pugilist. Open as sunlight, as fairlane, it has few fine shades and little of what is generally meant by atmosphere. It states and asserts, loves and despises. It is concerned almost exclusively with things in themselves rather than because. It proclaims "I am."

The statement contained in the last line—the very thing which has been so beautifully expressed in *Vairagya sathan*, the new play of Sir Rabindranath Tagore.

Here is the poetry of a man in love with the natural innocence, the instinctive nature, of all creatures great and small, of a man perfectly, effortlessly happy with a world so fresh and lovely with life and light and "million tinted" diversity as it was on the crest of all Sundays, violently menacing and fiery against tyranny and cowardly oppression, the lost of the strong against the weak.

Pity him, this dupe of dream,
Leader of the herd again
Only in his daft old brain,
Once again the bull supreme,
And bull enough to bear the part
Only in his tameless heart.

Pity him that he must wake;
Even now the swarm of flies
Blackening his bloodshot eyes,
Bursts and blisters from the flies,
Scattered from the feast half fed,
By great shadows overhead.

And the dreamer turn away
From his visionary herds
And his splendid yesterday,
Turns to meet the loathly birds
Flocking round him from the flies,
Waiting for the flesh that dies.

Here are a few beautiful lines of Hodgson:

He came and took me by the hand
Up to a red rose tree,
He kept his meaning to Himself
But gave a rose to me.

I did not pray Him to lay bare
The mystery to me,
Enough the rose was Heaven to smell
And his own face to see.

The article under "review" concludes thus:

Fundamental brainwork has long been acknowledged as essential to the writing of poetry; fundamental heart work is as indispensable. A man is half dead who exists without either; a poet without them has not yet been born at all. What we each ask of poetry, what precise proportions of its necessary ingredients, is a personal question. Poetry, as such, is elemental. In all poetry we take what is given to us as it is given. Mr. Hodgson's poetry depends for its originality on its pure singleness of spirit and purpose. There is little of the metaphorical, very little imagery, practically no allusiveness, nothing elaborate or literary. It is bare, vivid, wasteless—as near action as words can be. It serves life, it serves beauty. And its beauty and music is as much its own as its love and faith and courage are his that made it:—

The song of men all sorts and kinds,
As many tempers moods and minds
As leaves are on a tree,
As many faiths and castes and creeds,
As many human bloods and breeds
As in the world may be;
The song of each and all who gaze
On Beauty in her naked blaze,
Or see her dimly in a haze,
Or get her light in fitful rays
And unmet needles even,
The song of all not wholly dark,
Nor wholly sunk in stupor stark
Too deep for groping Heaven—
And alleluia's sweet and clear
And wild with beauty men mishear
From chimes of song as near and dear
To Paradise as they,
The everlasting pipe and flute
Of wind and sea and bud and brute,
And lip-deaf men imagine mute
In wood and stone and clay,
The music of a lion strong
That shakes a hill a whole night long,
A hill as loud as he,
The twitter of a mouse among
Melodious greenery,
The ruby's and the rainbow's song,
The nightingale's—all three
The song of life that wells and flows
From every leopard, lark and rose
And everything that gleams or gors
Lack lustre in the sea.

Why should Hindu Girls Go to America.

Miss K. Tullaskar, who is an M.A. of the Chicago University, (in fact she is the first Hindu girl to get the Master's degree from an American University) very ably answers the above question in the pages of the *Hindustanee Student*. Says she:

American universities are more democratic and

broadier than our own universities. The purpose of Indian universities is to enable students to pass government examinations and thus be eligible to hold government positions. The Hindu girls may need schooling, but they are sadly in need of education. In Indian universities girls learn things that they never use in life. If they are in the American universities they learn the practical things that are most useful to them in life. This education equips them to take their right position whether at home or in the world. They may enter the married life or remain unmarried, but they have several duties and obligations toward their families and their fellow beings. If they are interested in humanity they have many responsibilities toward those who are less fortunate than themselves.

American universities give a practical training as well as culture and prepare a person for his vocation in life. There is a vast field open to girls in American colleges. They may develop their faculties in special lines for which they have talent. Their education abroad will enable them to understand the right position for them to take in the upbuilding of the nation.

The subjects that our girls can study in America are sanitation, hygiene, psychology, sociology, domestic science. Then besides these are subjects that bring culture and breadth of mind as science, history, political economy, literature, etc. The work is interesting because we get different points of view. The study of history which seems to us so dry in India becomes very interesting here; because here the professor does not try to stuff the memory of his students with dry facts, dates and military strategy. It is a study of living human society and its affairs, the several forces that affect these affairs, the stages through which the society was passing in the past and the reaction on the future.

Another reason for their coming is that here they have a choice of subjects and do not have to take the studies that they dislike or in which they could never make much progress. We all know that that is not the case in India. The reason that education is a failure or makes so little progress is because it is based on wrong lines and is not according to improved and modern scientific methods. What we need in India is democracy, broad and practical education. We want trained women who can help the cause of education of women. We want women who will be able to take up the several problems that confront us in India.

Our girls do know the simple and practical things of every day life. But they would be more efficient if they knew how to make things scientifically and use the scientific methods. This scientific learning is available in American universities which are far more advanced than our own.

Before Marching and After

is the title of a pretty poem contributed to the *Fortnightly Review* and written in memory of F. W. G. by Thomas Hardy. The poem, which we quote below, might as well have been written in memory of the hundreds of thousands of warriors of all nationalities who rushed to battle to court death.

Orion swung southward askant
Where the starved Egdon pine-trees had thinned,
The Fieads aloft seemed to pant
With the heather that twitched in the wind;
But he looked on indifferent to sight, such as these,
Unswayed by love, friendship, home joy or home

sorrow,

And wondered to what he would march on the
morrow.

The crazed household clock with its whim

Ran midnight within as he stood,

He heard the low sighing of her

Who had striven from his birth for his good

But he still only asked the spring starlight, the
breeze,

What great thing or small thing his history would
borrow

From that Game with Death he would play on the
morrow.

When the hearth wore the robe of late summer,

And the furthest bells, hot in the sun,

Hung red by the door, a quick corner

Brought things that marching was done

For him who had pined in that game overseas

Where Death stood to win; though his memory would
borrow

A brightness therefrom not to die on the morrow.

What is a good Plot?

In noticing Mr. Arnold Bennett's "Author's Craft" the *Times* expresses its views as to what it thinks to be a good plot. Though it is not binding on the novelist to abide by the *Times'* point of view, for as Mr. Bennett says quite rightly, no critic has a right to tell the artist what he ought to do, still we can't the following with a hope that it would be of some help to our young literary men who may be thinking of writing novels or short stories.

A plot is not necessarily good because you cannot tell in it what is going to happen next. "In some of the most tedious novels ever written you cannot tell what is going to happen next—and you do not care a fig what is going to happen next." But, he adds, "It would be nearer the mark to say that the plot is good when you want to make sure what will happen next. Good plots set you anxiously guessing what will happen next."

Most people would agree to this; but is it true? Is it true that in the best novels or the best plays we guess anxiously what will happen next? We assume the best novels and the best plays to have the best plots, because plots are made for novels, not novels for plots.

The aim of a plot is, not to produce anxiety, but to have cumulative power, which is also the aim of structure in music. Every one says that the interest of a plot ought to increase up to the end, which is true; but this increase of interest is not necessarily an increase in anxiety, for it is, in the best works, interest in the present that increases, not in the future; and the interest is caused by what has happened, not by what we expect to happen.

The plot is entirely the writer's affair; it is a piece of contrivance by means of which he makes the best of himself, contrivance being necessary to act in this imperfect world. But, being contrivance, it saves us when the reader is not aware of it, and the greater the artist the less contrivance he will need; which, no doubt, is the reason why critics so often say that the plots of the greatest works are not good. The critic takes to judge—it is his weakness—and he cannot judge contrivance where there is none, or where he does not see it.

The Unfinished World.

The universe is not perfect, it is incomplete. There is yet plenty of disorder, plenty of things that remain to be made, plenty of energy that is being wasted over a bad cause. Evil there is, but we need not despair, since it is not a permanent element in the universe. The material universe is the symbol and the commencement of the moral and spiritual world. It is spirit, not mere force, that restrains the tempest.

This is the subject-matter of a short article in the *Nation*. We read further:

We live in a universe only in part reduced to order, only in part rescued from chaos, rudimentary, in process of becoming, and incomplete. There is goodness in the world, but imperfect goodness; reason, but incomplete reason; law, but law imperfectly formulated and enforced. It was an unfinished world from the creation on which "God rested", distant is His, and our, Sabbath; as yet it is not; it *remains* *ethos* for the people of God." On the supposition of a finished creation the world would be a tangle of conflicting and broken purposes, life meaningless, God a dream. This was the truth underlying the old dualistic religions which pictured the world as a battlefield between light and darkness, the good and the evil principle. Their error lay in the relative significance which they attached to the two elements, not in the recognition of the actual conflict between them. This conflict is a primary fact of experience. St. Paul's famous argument in the Epistle to the Romans is built upon it. The glory is not, but "shall be," revealed in us, the creature is not, but "shall be" delivered from the bondage of corruption; as we "wait for the adoption, to wit, the redemption of our body," so its "earnest expectation waiteth for the manifestation of the sons of God." In Nature this conflict takes the shape of evolution; in speculation it becomes the Dialectic of the Idea; in religion it is the "God all in all" viewed as the remote goal of the world progress. But throughout the world is for us a thing not become but becoming, a design imperfectly realized, potential, in process of reduction to actuality. Hence the home longing of the soul: "here have we no abiding city, but we seek one to come."

Were it not so, future would be written large upon the world, life, and man. Think of the creations which have gone under in past time, the fauna and flora of vanished worlds; the oceans, the continents, the civilizations sunk in the waste of the ages. Were the visible all, could we escape from the conclusion that

"We are such stuff
As dreams are made on; and our little life,
Is rounded with a sleep."

In the course of an article under the title

Readers and Specialists

the *Saturday Review* makes the following observations:

General reading, much abused, is, after all, at the root of most of the ideas and beliefs of educated people. It is, of course, better to be a specialist—relied in all the original sources of information. It is, indeed, almost essential to know at least one thing well, for to have followed out one line of thought to its origins gives one clearness and confidence in the present of others. It gives one a sense for the truth, and judgment in assessing evidence. But to despise general reading on principles, to refuse some excellent historian because one cannot read the Statutes and the Court Rolls, is absurd.

It is commonplace that deep study of a subject is likely to be more instructive, and a better discipline for the mind, than a more general acquaintance; that a man would discipline his mind more effectually by studying the whole range of Greek literature than by reading, say Grote's "History of Greece." But this does not imply that the person who reads and forms his opinions from Grote has no right to speak at all.

The theory that to obtain any knowledge worth having it is necessary to go back to original sources of information leads, if closely followed, to feebleness and timidity of thought. It condemns a person to specialism or to silence.

Stephen Graham writing in the *Times* about

Russian Literature and the War

says:

The war seems to have brought a stimulus to Russian literature similar to that experienced in England. On the whole, however, nothing striking has been produced during the year of the war, no book that has appeared stands out attracting universal attention. It is the quantity rather than the quality that calls for comment.

The most curious product of the war period is the collections of war stories, five or six of which are contributed to by leading tale-writers and novelists.

They all seem to be engaged chiefly in their artistic work. But Kuprin, Kuzmin, Sologub have all produced interesting war stories. Perhaps the best collection is the "Lukomorie Sbornik," where in a remarkable passage in one of the stories a Russian gives his verdict on the war—In years to come people will say that this was a bad war, but I who have just come back from the war tell you that it is a good war, that it brings out good things in people.

Maxim Gorky has published two books, "Childhood" and "In Russia". The autobiographical volume must have been written by Gorky whilst he was abroad, since it appeared serially in the *Russian Word* before he returned to Russia. So the other volume is the first written by him under the fresh influence of

seeing Russia. Unfortunately for the reader it is hardly representative of Gorky's new life. It is a book of powerful realist sketches done in his old manner that they say—nothing of the New Russia and Gorky's passion to have her more Western.

The only volume of poems to achieve four editions during the year is Severanin's "Victoria Regia," where fun is made of the war and the poet says that war is for the warlike but not for him.

It does not mean to be a traitor,
To be joyful and young,
Not torturing prisoners,
Nor hurrying into the shrapnel smoke,
To go to the theatre or the cinematograph,
To wait, yes, buy myself a muren,
Or to put many sweet and gentle things
In a letter to my sweetheart.

As a contrast to this cheerful flippancy there is the selection of beautiful poems from Alexander Blok, entitled "Russia."

In the pages of the *Poetry Review* E. Hamilton Moore makes us familiar with the lovely verses of

Alexander Stephen

who was unknown to fame. The story of his life as told by the writer is sweet and serene and ennobling albeit pathetic in the extreme.

He pressed and left no name, or memory save in the hearts of the few who knew and loved him. When I met him he was old, gray haired and poor. He lived in a sordid suburb, arid, dreary, a man in the desert wherein human souls die parched. He toiled at a tedious and ungenial task in a sunless office in a grimy city, and he treasured memories, far off memories, of singing birds, green woods and flashing sea. I see him still: his ever-cver smiling eyes peering behind his glasses, his pointed beard pushing a little forward, his characteristic and Caledonian nostrils smiling the interest and the joy of life, even in the dingiest street; under his arm some bundle of the classics, purchased, after long fingering, at a second-hand stall, purchased with "tram-fares," and a tramp home through the rain. Over the backyard gate in secrecy the precious bundle must be slipped at nightfall, that he may thereafter enter his own front door with obviously empty hands to mock wifely supervision. I never heard him utter unkind word to or of living creature. I never heard him breathe despondency. His presence reconciled funds and was a source of still content. And yet, he nursed his dreams of days gone by.

Before I knew him he had followed many callings. He told me he had been "postie" in a Scottish rural district; that on his rounds about the lanes and fields he had learned to love the bees and fleeting clouds and murmurous leaves, and had been first inspired to sing their beauty. He was schoolmaster too, in some now forgotten school where surely he understood the heart of youth. He turned news agent also, but without success. It was only too easy for the village scallywags to engross him in some well imagined theme, while a pattering accomplice loitered by to snatch unguarded booty from an eye averted with

dreams. His worst lapse was into an insurance agent; a calling in which he found his purgatory. To expose defaulters was beyond his power. He struggled to pay their debts. At last so deeply did he stand involved that he flung his books and papers into the river, took his bidde and bade farewell to his native land, and so fiddled his road to the city where I met him.

About his letters and verses we are told that

A tiny manuscript volume, rubricated and paper covered, and some three or four letters in the same fastidious hand remain as mementoes of a kindly fellowship.

The letters are as characteristic as the poems; even more so, perhaps, being completely free from the conventions of the amateur versifier, more expressive of the gentle humor which was among the man's most salient features. One of the most charming is written round that well-worn theme, the weather, and imports into its grayness a pathetic April sunshine:

"I believe the weather must have been 'lovely' in some places, yesterday. I don't think I noticed it much. I have a sort of blurred notion that the light was a little better than usual. Your enthusiasm of last night has made me rather more observant this morning. When I look up from this paper, I can see that the sky has a good deal of light in it. Above the blank brick wall of the warehouse opposite, it shows like a large sheet of tin foil seen through a gauze veil, sadly in want of washing; and there is a suggestion of brightness about the legend, in huge enamelled letters, which reads C.C.D. & Co., Ltd. This scene would have more enchantment if the wall long window of plate glass, through which I survey it were to be gone over with a wet wash-leather to remove the fine mottling of Arcotics dust, diversified by small clots of dried mud, that somewhat obscures its transparency.

"But in spite of such drawbacks, one does have a kind of subconsciousness that the weather must be rather fine somewhere. Perhaps there may be a hint of coming greenness on the fields, if one could see them, and the sparkle of sunlight on running water. It may even be that on some, as yet, budless tree, an optimistic bird may find himself surprised into a brief twitter of premature song.

"One can imagine lots of things if one lets fancy loose, to fly beyond smoke-grained windows and soot-encrusted brick-walls, until it reaches some spot where men may see

The jocund day

Stand tip toe on the misty mountain-tops."

Gentle and cordial as he was to every man, it was rather round places than persons that the clinging tendrils of his affection fastened, above all round places loved in earliest years:

Dunnottar, O Dunnottar,

A spell is in the name!

I unnottar, O Dunnottar,

It's Youth, an' Love, an' Hame!

Once and again he returns to the same theme, emphasizing the simple verses with a pencilled note of modest author's pride, "My own favorite," at the foot:

The bonnie green woods of Dunnottar,

I'm thinkin' it's mornin' there,

An' the gowans are white on the braes again,

An' the song of the birds ance mair

Is mellow, an' sweet, an' gleesome
As it was in the days lang syne,
When we were there in the Spring time
O the years we were laith to tyne !

The bonnie auld wood of Dunnottar,
Far dearer it is to me
Than the fairest scenes that the waul' can show
In mony a fur countree '
We hae played on its braes as bairnies,
We hae loved an' sorrowed there,
Gad we win to the wood o' Heaven
Do you think they will be as fair

From memories and regrets which never strike
a poignant note, he looks out with serene philosophy
heart rather than intellect, on life's transitory
ows. This attitude is illustrated in the verses "On
Lifelong Friendship."

Remembering the old days, the swift sweet seasons,
(To memory grown, alas ! how swift and sweet
I search my soul again to-day for reasons
Whereon our faith may stand with steadier feet
There comes no answer I can frame in words,
Only the birds

Sing as they did then, and I use to go,
Feeling that, somehow, I am answered so.
For Spring again has tiled the land with flowers,
Clothing the woods and happy fields in green,
Larks in the blue and linnets in the bowers
Carol again as if there had not been
Winter or night, to kill or chill their song ;
And all day long
They charm with their unwearying melodies
The listening, whispering woods and sunlit leas.

Their little lives, like ours, go out unheeded,
And with the withered leaves are swept away.
But song lives on, immortal, unimpeded,
New as the dawn is, and the enduring day :
Yea, though the singer dies the song remains,
In deathless strains,

And Hope, awakening, holds a scroll unfurled,
"Youth, Love and Song live ever in the world !"
Yea, Song endures and fills the world for ever,
Youth is re-born with every sun-dawn fair,
Though we are but as ripples on the River
That flows, we know not whence, we know not
where,
With ever-deepening and broadening wave,
Yet every grave
We make drifts backward, and is lost to sight
In an effulgence of Eternal Light !

A year or two later he wrote in the same calm
spirit the "Ballade of the Burnside" :

Calm as the current of my days
Along its wonted channel flows
The stream that winds by well known ways,
Now fallen into then old repo e

Around it lie the winter snows
Sown from a gray sky overhead,
And sea ward peacefully it goes,
Though summer flowers have long been dead.

At times a sunbeam o'er it plays,
But on the brink it finds no rose :
On sheltered banks by which it strays
No longer any wild flower grows.

No more this winding pathway knows
Thy feet, where now alone I tread,
Yet memory nameless bloom bestows,
Though summer flowers have long been dead.

Here summer ever with me stays,
And fair, unfading flowers disclose
Their sweets to me where'er I gaze,
While August sunlight round me glows.

No flowers on earth abide like those
(On dews of Love and Memory fed ')
The heart with deathless bloom endows,
Though summer flowers have long been dead

ENVOT

Dear eyes that bade my heart unclose,
Dear Heart on mine that sunset shed,
For me Love's flower immortal blows,
Though summer flowers have long been dead.

Here is a sonnet written by Alexander
Stephen and entitled "An April Eve."

Between me and the sun's pale beam
I saw a blackbird, sitting lone and high
Among the branches, dark against the sky,
Silent and still, as if some happy dream
Possessed him, as he listened to the stream
That o'er its white pebbles trickled by.
Then with a chuckled song I saw him fly
Far through the wood, and so lost sight of him.
Within the wood the wind seem'd whispering
Some secret thing, unutterably sweet.
In fitful sights that grew and died away.
And in the dim light there were shadowy feet
Among the shadows, pausing, hastening,
And voices, that had in unvellous things to say.

The following lines sum up most fitly
the worth and significance of the little
volume of verses :

These few songs the years have won from me,
The fleet winged years of youth that shone and fled,
And now are dear with memories of the dead,
Songs that seem echoes of the wind and sea
Heard over fields whose fruit are harvested,
And where our feet again may never be.

ROUND THE WORLD WITH MY MASTER

BY A DISCIPLE OF DR. J. C. BOSL.

III

AFTER the success achieved at the conservative University of Oxford, it was now necessary that the Master's work should become widely known all over Europe. And for this purpose no scientific institution commanded greater authority and respect than the Royal Institution of Great Britain.

THE ROYAL INSTITUTION.

As the history of this great institution, from which epoch-making discoveries have startled the scientific world for the last hundred years, is not well known in this country, I shall give a short account of some of the important work that has been carried out in this institution. The Royal Institution was founded in 1799 by Count Rumford and a few of his friends "to prosecute research and to illustrate and diffuse the principles of Inductive and Experimental Science." It never had any State aid but had grown and expanded with its growing scientific activities. Unlike many institutions the tragic history of which is but too common, stone and masonry did not here crush the scientific spirit. Its outward opulence kept pace only with its inner growth. Under its shelter have been worked out many of the fundamental ideas upon which is reared the vast industrial fabric which has enriched England. Within its walls were achieved those epoch-making discoveries in electricity which have transformed the economic conditions of the modern age. The eminent men who have successively directed its continuous research have collectively made contributions of incalculable value for the world's well-being.

THOMAS YOUNG here (1801 to 1803) established the undulatory theory of Light by his historic discovery of Interference of Light.

HUMPHRY DAVY continued the work from 1802 to 1815. He made many discoveries in Electro-Chemical Science, succeeded in decomposing Potash, isolated

Potassium, Sodium and Chlorine and by his researches on Fire damp and Flame made the famous Safety Lamp which has been the means of saving thousands of lives.

MICHAEL FARADAY, the greatest scientific man of the age, worked here from 1833 to 1867. He discovered here the Magnetic Rotations, was able to liquify Chlorine and other gases, made that epoch-making discovery of Magneto-Electricity the numerous applications of which have transformed the modern conditions of life. As the visitor enters the great Institution he sees in front of him Faraday's life-size statue, which bears no inscription. More eloquent than any inscription is an iron ring which he holds in his hand and round which is wound a helix of copper wire. The sparks that flamed across from the ends of this helix proved to be as mighty as the thunderbolt of Jupiter. The laws which govern the electric decomposition of compound substances were discovered by him and bear his name. He determined the Specific Inductive Capacity, visualised the Lines of Magnetic Force, and determined the Magnetic Rotation of Light. The instruments with which he made these discoveries have been preserved in loving reverence and their exhibition serves to inspire men who are trying to follow his footsteps.

It is also here that JOHN TYNDALL worked from 1853 to 1887 and thrilled his audience by his remarkable oratorical powers and his extraordinary gift as an experimenter.

One of the greatest living physicists of the age, LORD RAYLEIGH, also worked here from 1887 to 1905, and is still the Honorary Professor of the Institution. The photograph reproduced is the most recent and was sent by him to the Master a fortnight ago. It was Lord Rayleigh's work that contributed greatly to the determination of the exact values of the standards of Electrical Measurements. His work on Sound and Electri-

John Tyndall.

Statue of Michael Faraday at the Royal Institution.

Dr J. C. Bose at the Royal Institution, 1914.

city are classical. It was his determination of the density of atmospheric nitrogen that led him to predict the discovery of Argon. The wide range of his scientific activities is well known in such works as *Phenomena of Water Jets and Water Drops*, *Colours of Thin Plates*, *Diffraction of Sound*, *Interference Bands*, *Investigation on Argon*, *Limits of Audition*, *Foams*, and *Animal Flights*.

SIR J. J. THOMSON has been working here since 1905 on Rays of Positive Electricity, on carriers of Positive Electricity, on Electric Striation, on a New Method of Chemical Analysis and the Results of the Application of Positive Rays to the Study of Chemical Problems.

SIR JAMES DEWAR has been the Fullerian Professor of Chemistry since 1877. His has been the great achievement of Liquification of Air, Researches on Liquid Air and Zero of Absolute Temperature, on Phosphorescence and Ozone, on the Scientific uses of Liquid Air, on Liquid Hydrogen, on Solid Hydrogen, on New Low Temperature Phenomenon, on the Nadir of Temperature and allied problems, on the problems of Helium and Radium, and on the coming age of the "Vacuum flask," which is one of the most important practical outcomes of his discoveries.

Such is the great tradition of the Royal Institution, and no recognition could be greater than to be asked to lecture before this Institution. Here in addition to the regular series of lectures there is organised a special series known as the Friday Evening Discourses. At these Meetings a lecture of one hour is delivered by one of the recognised authorities upon a new discovery or the most recent development of some great scientific speculation. To be chosen to deliver a Friday Evening Discourse is regarded as an unique honour. The lecturer enters the historic Hall and stands at the identical place occupied by Davy and Faraday and commences his Discourse without any introduction; for one asked to deliver a Friday Evening Discourse must be already well known all over the scientific world and therefore requires no introduction. He begins his lecture abruptly without making any reference to the President or the audience. For it is understood that his message is to the world and not to any group of people. These innovations, at first, are startling to a visitor unaccus-

tomed to the traditions of the Royal Institution. The audience at Albemarle Street is crowded by the aristocracy of intellect and culture. The street itself becomes almost impassable on account of the waiting carriages and motors. In order to avoid serious dislocation of traffic it is absolutely necessary that the lecture should begin at the stroke of nine and end with the stroke of ten. This tradition was, however, broken once when the enthusiastic audience at the Royal Institution demanded with one voice a longer continuation of my Master's Discourse.

MASTER'S DISCOURSE ON ELECTRIC WAVES.

The unique honour of being asked to address at the Royal Institution has on three different occasions been conferred on the Master. It was on January 29, 1897, that he, for the first time, delighted and astonished the audience at the Royal Institution by his Discourse on Electric Waves. The apparatus which he invented is so perfect that the most delicate and astonishing results were demonstrated with a precision that challenged belief. In fact Lord Rayleigh in coming forward to offer his heartiest congratulations remarked that to give this marvellous demonstration an air of reality it would have been better if one or two experiments had failed. No compliment could be greater than this at the very place which had witnessed the demonstration given by such experimenters as Faraday and Tyndall. Indeed the Master's unrivalled experimental dexterity so impressed the Western world that he has often been termed the Wizard from the East! The celebrated Hiram Maxim, perhaps one of the greatest inventors of the age, was so struck by my Master's experiments that after the lecture he came forward and introduced himself as Maxim the mechanician. He asked as a personal favour to feel his hands to realise for himself that tactile sensibility which could so unerringly feel the pulse of Nature. Not less significant than these experimental wonders were his theoretical insight by which many phenomena relating to the Electro-Molecular properties of matter were revealed for the first time. Sir Henry Roscoe in an address spoke of his methods as "opening out means of knowing the internal molecular structure of bodies perfectly opaque to the ordinary eye of which we have hitherto had no

means of examination; these are now as open, as clear as the sky or day light." Another most important discovery announced at this lecture was the selective transparency of certain bodies in virtue of which an identical substance was perfectly transparent when held in one way and perfectly opaque when placed at right angles to the first position. When he was invited to repeat this lecture at Helmholtz's Laboratory in Berlin Prof. Warburg, who succeeded Helmholtz, led him to the lecture Hall and on the way pointed out his own research room and made a great mystery of some investigation in which he has been engaged for the last four years. This research was regarded of such importance that it was imperative to observe special secrecy. The door of the research room could therefore be opened for half an inch and then hastily closed. While the Master was arranging his experiments in the lecture Hall something attracted Prof. Warburg's attention. This was a particular crystal which the master had discovered, having the remarkable property of selective transparency for electric waves which was demonstrated before the astonished Professor in the course of half a minute. To my Master's amazement the German Professor rushed out of the Hall only to return with his assistant Karl and to tell him that what they had failed to demonstrate after four years of laborious research was accomplished by this Indian visitor in the twinkling of an eye. Professor Warburg deservedly occupies the very front rank in physical science, and this brought to his laboratory a very celebrated American investigator, Professor Milikan, whose recent measurements of mass of sub-atoms have astonished the scientific world. At that time Mr. Milikan was interested in Electric Waves and asked Prof. Warburg to help him to carry out researches on this subject. "Ah!" said the German savant, "this subject has been taken up by a man in Calcutta called Bose. He is that sort of man who leaves nothing for other fellows to attempt."! And thus this American scientist was diverted to another subject which he has enriched by his contributions. In this Friday Evening Discourse, the success of the experiments was due to the absolute certainty and extraordinary delicacy of the wireless detector which my Master invented. Great commercial value

was attached to a detector of this type and before the commencement of his lecture, he was approached by the President of a Syndicate to secure a patent for him for his invention. My Master, however, refused to commercialise his scientific contribution and the *Electrical Engineer* expressed its astonishment that

"No secret was at any time made of the wonderful apparatus, so that it has been open to all the world to adopt it for practical and money-making purposes."

The success of this lecture was so great that an important professorship at a well-known University was offered to him, if he chose to accept. Many of his friends urged him on international grounds to secure this recognised position in the world of European science, and the advantages offered for the prosecution of his researches. My Master thought, however, that the duty of every Indian was to share the disabilities of his countrymen and his true place was in India and to work for her and for the college which he entered when he was unknown. Nothing, therefore, gave him greater gratification than the tribute paid by the *Electrician* to his country and his college:

"The scientific world is immensely indebted to Dr. Bose for the researches he has already completed and presented to it—researches which redound greatly to the credit of India and more specially of the Presidency College, Calcutta, from which Dr. Bose is now on a visit to this country."

One is still haunted by the concluding portion of his address at the Royal Institution when he asked his audience to imagine a gigantic electric organ provided with infinite number of stops, each stop giving rise to a particular ether note.

"Imagine an unseen hand pressing the different stops in rapid succession, producing higher and higher notes. The ether note will thus rise in frequency from one vibration in a second, to tens, to hundreds, to thousands, to hundreds of thousands, to millions, to millions of millions! While the ethereal sea in which we are all immersed is being thus agitated by these multitudinous waves, we shall remain entirely unaffected, for we possess no organs of perception to respond to these waves. As the ether note rises still higher in pitch, we shall for a brief moment perceive a sensation of warmth. This will be the case when the ether vibration reaches a frequency of several billions of times in a second. As the note rises still higher our eye will begin to be affected, a red glimmer of light would be the first to make its appearance. From this point the few colours we see are compressed within a single octave of vibration—from 400 to 800 billions in one second. As the frequency of vibration rises still higher, our organs of perception fail us completely, a great gap in our consciousness obliterates the rest. The brief flash of light is succeeded by unbroken darkness."

DISCOURSE ON UNIVERSAL SENSITIVENESS OF MATTER.

The next time when he was asked to address the Royal Institution was to announce his great discovery of the Universal Sensitiveness of Matter, when he demonstrated by means of automatic records the common history of stress and strain in the Living and the Non-Living. We are still thrilled by his peroration on that memorable day, May 10, 1901:

"It was when I came upon the mute witness of these self-made records and perceived in them one phase of a pervading unity that bears within it all things—the note that quivers in ripples of light, the teeming life upon our earth and the radiant suns that shine above us—it was then that I understood for the first time a little of that message proclaimed by my ancestors on the banks of the Ganges thirty centuries ago—

"They who see but one in all the changing manifoldness of this universe, unto them belongs Eternal Truth—not to none else, not to none else!"

Now the Master was asked on this the third occasion to deliver a Discourse on his recent discoveries in the unvoiced world of plants. Lord Rayleigh, who always takes great interest in my Master's work, realising the extreme delicacy of the experiment the success of which depended on uncertain conditions of the weather, sent word advising him not to attempt more than one or two experiments. The duration of the lecture being strictly limited to one hour, any untoward failure would seriously affect the success of the lecture. Such a veteran experimentalist as Sir Michael Foster was completely nonplussed at the beginning of one of his lectures before the Royal Institution by the sudden stoppage of the heart-beat of the frog which was the subject of demonstration. No physiological experiment could be simpler than this, yet one of the greatest physiologists of the age found himself unable to repeat it at the critical moment. So the advice of every one about performing difficult experiments was the emphatic "Don't." A very striking experiment was specially devised for my Master's lecture on chromatic effects and its wonderful variation exhibited by the reflection from a soap film demonstrating the principle of sympathetic vibration. Mr. Heath, who was the special assistant of Tyndall, now in charge of the Royal Institution Laboratory, dissuaded us from attempting it. Taking me into his confidence he said that it was only last week when he

was demonstrating certain experiments on soap film given by one of the eminent physicists that the "wretched film took all the conceit out of them by suddenly bursting at the very psychological moment!" And he told us off many other instances.

DISCOURSE ON PLANT AUTOGRAPHS.

On the other hand the Master realised the fact that his theories had already been for several years before the public; it was blank incredulity that stood in the way of their wide acceptance and nothing short of visual demonstration could bring conviction to all. He, therefore, took the bolder step and risked failure on the chance of success. The assistants of the Royal Institution kindly offered their services to help him in these demonstrations, but he was determined that this was purely to be a contribution from India in every detail. He took us to the Royal Institution early in the morning where we could arrange our experiments in the preparation room on a table the top of which could be transferred to the Hall immediately before the lecture. I had for my comrade Jyoti Prokash Sircar. The Master looked after every detail and made us follow the order in strict sequence. All this time we were tense with anxiety but as the hour approached he asked us to throw away all fear. Everything that could be foreseen had been done and nothing further need worry us. We now felt a great quiet and were not a bit afraid for the results. The Master's address was on Plant Autographs and their Revelations. Almost next door to this great Institution of learning there were flourishing establishments in Bond Street of crystal-gazers and other exponents of the occult art. He commenced his Discourse by referring to these professors of sciences bordering on the mystical who claimed to read a man's character and antecedents by mere inspection of his handwriting. As to the authenticity of such claims scepticism might be allowed. But there was no doubt that one's handwritings are profoundly modified by conditions mental and physical. At this moment there was thrown on the screen photographs of signatures of Guy Fawkes, of Gun Powder celebrity, before his trial and after his conviction. The sinister variations in these signatures were at once evident. The crabbed and distorted character of the last words that Guy Fawkes wrote on

earth as in the dark hours of the morning on which he was executed he set his hand to the written confession of his crime, told their own tale of what had transpired in the solitary imprisonment of that fateful night. Such is the history that unfolded itself to the critical eye by the lines and curves of a human autograph. Under a placid exterior, there is also a hidden history of the life of the plant. Storm and sunshine, warmth of summer and frost of winter, drought and rain, all these and many more influences come and go about the plant. What coercion do they exercise upon it, what subtle impress do they leave behind? Then after raising these questions he explained how the plants could be made to reveal their inner history by means of scripts in answer to questioning shocks. Now began a series of experiments each more startling than the previous one.

The soap film that reflected the light did not burst but was thrown into sympathetic vibrations in answer to a cry from a distance. The colour pattern hitherto quiescent was converted into a whirlpool of peacock green and molten gold. The *Mimosa* seen on the table, automatically recorded the speed of its nervous impulse. Our *Bon Chandal* or the Telegraph plant recorded its throbbing pulsations and the plant under the shock of death recorded its death-spasm. All these experiments were repeated with the utmost success without a moment's loss of time, each experiment being punctuated by the enthusiastic applause of an audience of appreciative European savants. And there was almost a hush of awe when the Master concluded the story of these our mute companions silently growing beside our door and of the pathos of life that is unvoiced.

(*To be continued*).

ADDENDUM

The following lines were inadvertently omitted from the article entitled *Two PANJABI PLAYS*, page 80, 2nd column of the January number after the lines "My dolls, my dolls! Let me play with my dolls!" Kauran mad with grief follows.—

"This play is also the first attempt at playwriting by its author. It is remarkably well constructed and contains the elements of true drama. From a quiet beginning it gradually gathers in dramatic force until the final stirring climax.

"Both these plays breathe the atmos-

phere of India, or perhaps I should say of the Punjab. True they are criticisms, but that fact does not rob them of beauty and of the simple humanity that pervades them. They are as splendidly Indian as the Irish plays are splendidly Irish. If this standard of writing is kept up great things may yet be done for Indian drama. India at this stage of her evolution teems with subject matter for artists. Such a time of transition, of rapid outgrowth from old customs, is rich with problems and with the conflict necessary for drama."

SETT'S JEWELLERY

Has **SET** an example in the market and therefore the wonderful popularity it enjoys among its customers. The reasons are not far to seek.

In making and finish—**Up-to-date**.

In price—**Just** and **Moderate**.

MY REMINISCENCES

BY RABINDRANATH TAGORE.

[ALL RIGHTS RESERVED.]

(13) *My Father.*

SHORTLY after my birth my father took to constantly travelling about. So it is no exaggeration to say that in my early childhood I hardly knew him. He would now and then come back home all of a sudden, and with him came foreign servants with whom I felt extremely eager to make friends. Once there came in this way a young Panjabi servant named Lenu. The cordiality of the reception he got from us would have been worthy of Ranjit Singh himself. Not only was he a foreigner, but a Panjabi to boot,—what wonder he stole our hearts away? We had the same reverence for the whole Panjabi nation as for Bhima and Arjuna of the Mahabharata. They were warriors; and if they had sometimes fought and lost, that was clearly the enemy's fault. It was glorious to have Lenu, of the Panjab, in our very home. My sister-in-law had a model war-ship under a glass case, which, when wound up, rocked on blue-painted silken waves to the tinkling of a musical box. I would beg hard for the loan of this to display its marvels to the admiring Lenu. Caged in the house as we were, anything savouring of foreign parts had a peculiar charm for me. This was one of the reasons why I made so much of Lenu. This was also the reason why Gabriel, the Jew, with his embroidered gaberline, who came to sell *attars* and scented oils, stirred me so; and the huge Kabulis, with their dusty, baggy trousers and knapsacks and bundles, brought to my young mind a fearfully fascination.

Anyhow, when my father came, we

would be content with wandering round about his entourage and in the company of his servants. We did not reach his immediate presence.

Once while my father was away in the Himalayas, that old bogey of the British Government, the Russian invasion, came to be a subject of agitated conversation among the people. Some well-meaning lady friend had enlarged on the impending danger to my mother with all the circumstance of a prolific imagination. How could a body tell from which of the Tibetan passes the Russian host might suddenly flash forth like a baleful comet? My mother was seriously alarmed. Possibly the other members of the family did not share her misgivings; so, despairing of grown-up sympathy, she sought my boyish support.

"Won't you write to your father about the Russians?" she asked.

That letter, carrying the tidings of my mother's anxieties, was my first one to my father. I did not know how to begin or end a letter, or anything at all about it. I went to Mahananda, the estate munshi.* The resulting style of address was doubtless correct enough, but the sentiments could not have escaped the musty flavour inseparable from literature emanating from an state office.

I got a reply to my letter. My father asked me not to be afraid; if the Russians came he would drive them away himself. This confident assurance did not seem to have the effect of relieving my mother's fears, but it served to free me from

* Correspondence clerk.

all timidity as regards my father. After that I wanted to write to him every day and pestered Mahananda accordingly. Unable to withstand my importunity he would make out drafts for me to copy. But I did not know that there was the postage to be paid for. I had an idea that letters placed in Mahananda's hands got to their destination without any need for further worry. It is hardly necessary to mention that, Mahananda being considerably older than myself, these letters never reached the Himalayan hill-tops.

When, after his long absences, my father came home even for a few days, the whole house seemed filled with the weight of his presence. We would see our elders at certain hours, formally robed in their *chogas*, passing to his rooms with restrained gait and sobered mien, casting away any *pan* they might have been chewing. Everyone seemed on the alert. To make sure of nothing going wrong, my mother would superintend the cooking herself. The old mace-bearer, Kinnu, with his white livery and crested turban, on guard at my father's door, would warn us not to be boisterous in the verandah in front of his rooms during his midday siesta. We had to walk past quietly, talking in whispers, and dared not even take a peep inside.

On one occasion my father came home to invest the three of us with the sacred thread. With the help of Pandit Vedantavagish he had collected the old Vedic rites for the purpose. For days together we were taught to chant in correct accents the selections from the Upanishads, arranged by my father under the name of "Brahma Dharma," seated in the prayer hall with Becharam Babu. Finally, with shaven heads and gold rings in our ears, we three budding Brahmins went into a three-days' retreat in a portion of the third storey. It was great fun. The earrings gave us a good handle to pull each other's ears with. We found a little drum lying in one of the rooms with which we would stand out in the verandah, and, when we caught sight of any servant passing along in the storey below, we would rap a tattoo on it. This would make the man look up, only to beat a hasty retreat the next moment with averted eyes. In short we cannot claim

that these days of our retirement were passed in ascetic meditation. I am however persuaded that boys like ourselves could not have been rare in the hermitages of old. And if some ancient document has it that the ten or twelve-year old Saradwata or Sarngarava* is spending the whole of the days of his boyhood offering oblations and chanting *mantras*, we are not compelled to put unquestioning faith in the statement; because the book of Boy Nature is even older and also more authentic.

After we had attained full brahminhood I became very keen on repeating the *gayatri* †. I would meditate on it with great concentration. It is hardly a text the full meaning of which I could have grasped at that age. I well remember, what efforts I made to extend the range of my consciousness with the help of the initial invocation of "Earth, firmament and heaven." How I felt or thought it difficult to express clearly, but this much is certain that to be clear about the meaning of words is not the most important function of the human understanding. The main object of teaching is not to explain meanings, but to knock at the door of the mind. If any boy is asked to give an account of what is awakened in him at such knocking, he will probably say something very silly. For what happens within is much bigger than what he can express in words. Those who pin their faith on University examinations as a test of all educational results take no account of this fact.

I can recollect many things which I did not understand, but which stirred me deeply. Once, on the roof terrace of our river-side villa, my eldest brother, at the sudden gathering of clouds, repeated aloud some stanzas from Kalidas's "Cloud Messenger." I could not, nor had I the need to, understand a word of the Sanskrit. His ecstatic declamation of the sonorous rhythm was enough for me. Then again, before I could properly understand English, a profusely illustrated edition of "The Old Curiosity Shop" fell into my hands. I went through the whole of it, though at least nine-tenths of the words were unknown to me. Yet, with the vague ideas I conjured up

sacred-thread investiture, before the ceremony is complete.

* Two novices in the hermitage of the sage Kanva, mentioned in the Sanskrit drama, Sakuntala.

† The text for self-realisation,

* Spices wrapped in betel-leaf.

† It is considered sinful for non-brahmins to cast glances on neophytes during the process of their

from the rest, I spun out a variously coloured thread on which to string the illustrations. Any university examiner would have given me a great big zero, but the reading of the book had not proved for me quite so empty as all that.

Another time I had accompanied my father on a trip on the Ganges in his house-boat. Among the books he had with him was an old Fort William edition of Jayadeva's *Gita Govinda*. It was in the Bengali character. The verses were not printed in separate lines, but ran on like prose. I did not then know anything of Sanskrit, yet because of my knowledge of Bengali many of the words were familiar. I cannot tell how often I read that *Gita-Govinda*. I can well remember this line:

'The night that was passed in the lonely forest cottage.'

It spread an atmosphere of vague beauty over my mind. That one Sanskrit word,

'Nihrita-nikunja-grīham'

meaning 'the lonely forest cottage' was quite enough for me. I had to discover for myself the intricate metre of Jayadeva, because the division of metre was lost in the clumsy prose form in which the book was printed. And this discovery gave me very great delight. Of course I did not fully comprehend Jayadeva's meaning. It would hardly be correct to aver that I had got it even partly. But the sound of the words and the lilt of the metre filled my mind with pictures of wonderful beauty, which impelled me to copy out the whole of the book for my own use.

The same thing happened, when I was a little older, with a verse from Kalidas's "Birth of the War God." The verse moved me greatly, though the only words, of which I gathered the sense, were 'the breeze carrying the spray mist of the falling waters of the sacred Mandakini and shaking the deodar leaves.' These left me pining to taste the beauties of the whole. When, later, a Pandit explained to me that in the next two lines the breeze went out "splitting the feathers of the peacock plume on the head of the eager deer-hunter," the thinness of this last conceit disappointed me. I was much better off when I had relied only upon my imagination to complete the verse.

Whoever goes back to his early childhood will agree that his greatest gains were not in proportion to the completeness

of his understanding. Our Kathakas* know this truth well. So their narratives always have a good proportion of ear-filling Sanskrit words and abstruse remarks not calculated to be fully understood by their simple hearers, but only to be suggestive.

The value of such suggestion is by no means to be despised by those who measure education in terms of material gains and losses. These insist on trying to sum up the account and find out exactly how much of the lesson imparted has been understood. But children, and those who are not over-educated dwell in that primal paradise of knowledge where men acquire knowledge without going through the process of understanding. And only when that paradise is lost comes the evil day when they must understand everything. The road which leads to knowledge, without going through the dreary process of understanding, that is the royal road. If that be barred, though the world's marketing may yet go on as usual, the open sea and the mountain top cease to be possible of access.

So, as I was saying, though at that age I could not realise the full meaning of the *Gayatri*, there is something in us which can do without a complete understanding. I am reminded of a day when, as I was seated on the cemented floor in a corner of our schoolroom meditating on the text, my eyes overflowed with tears. Why those tears came I know not, and to a strict cross-questioner I would probably have given some explanation having nothing to do with the *Gayatri*. The fact of the matter is that what is going on in the inner recesses of consciousness is not always known to the dweller on the surface.

(11) A journey with my Father

My shaven head after the sacred thread ceremony caused me one great anxiety. However partial Eurasian lads may be to things appertaining to the Cow, their reverence for the Brahmin† is notoriously lacking. So that, apart from other missiles, our shaven heads were sure to be pelted with jeers. While I was worrying over this possibility I was one day summoned upstairs to my father. How would I like

* Bards or reciters.

† The Cow and the Brahmin are watchwords of modern Hindu Orthodoxy.

to go with him to the Himalayas, I was asked. Away from the Bengal Academy and off to the Himalayas! Would I like it? Could I have reached the skies with a shout, that might have given some idea of the How?

On the day of our leaving home my father, as was his habit, assembled the whole family in the prayer hall for divine service. After I had taken the dust of the feet of my elders I got into the carriage with my father. This was the first time in my life that I had a full set of clothes made for me. My father himself had selected the pattern and colour. A gold embroidered velvet cap completed the costume. This I carried in my hand, being assailed with misgivings as to its effect in juxtaposition to my hairless head. As I got into the carriage my father insisted on my wearing it, so I had to put it on. Every time he looked another way I took it off. Every time I caught his eye it had to resume its proper place.

My father was very particular in all his arrangements and orderings. He disliked leaving things vague or undetermined and never allowed slovenliness or makeshifts. He had a well-defined code to regulate his relations with others and theirs with him. In this he was different from the generality of his countrymen. With the rest of us a little carelessness this way or that did not signify; so in our dealings with him we had to be anxiously careful. It was not so much the little less or more that he objected to as the failure to be up to the standard. My father had also a way of picturing to himself every detail of what he wanted done. On the occasion of any ceremonial gathering, at which he could not be present, he would think out and assign the place for each thing, the duty for each member of the family, the seat for each guest; nothing would escape him. After it was all over he would ask each one for a separate account and thus gain a complete impression of the whole for himself. So, while I was with him on his travels, though nothing would induce him to put obstacles in the way of my amusing myself as I pleased, he left no loophole in the strict rules of conduct which he prescribed for me in other respects.

Our first halt was to be for a few days at Bolpur. Satya had been there a short while ago with his parents. No self-respecting nineteenth century infant would

have credited the account of his travels which he gave us on his return. But we were different, and had had no opportunity of learning to determine the line between the possible and the impossible. Our Mahabharata and Ramayana gave us no clue to it. Nor had we then any children's illustrated books to guide us in the way a child should go. All the hard and fast laws which govern the world we learnt by knocking up against them.

Satya had told us that, unless one was very very expert, getting into a railway carriage was a terribly dangerous affair—the least slip, and it was all up. Then, again, a fellow had to hold on to his seat with all his might, otherwise the jolt at starting was so tremendous there was no telling where one would get thrown off to. So when we got to the railway station I was all-a-quiver. So easily did we get into our compartment, however, that I felt sure the worst was yet to come. And when, at length, we made an absurdly smooth start, without any semblance of adventure, I felt woefully disappointed.

The train sped on; the broad fields with their blue-green border trees, and the villages nestling in their shade flew past in a stream of pictures which melted away like a flood of mirages. It was evening when we reached Bolpur. As I got into the palanquin I closed my eyes. I wanted to preserve the whole of the wonderful vision to be unfolded before my waking eyes in the morning light. The freshness of the experience would be spoilt, I feared, by incomplete glimpses caught in the vagueness of the dusk.

When I woke at dawn my heart was thrilling tremendously as I stepped outside. My predecessor had told me that Bolpur had one feature which was to be found nowhere else in the world. This was the path leading from the main buildings to the servants' quarters which, though not covered over in any way, did not allow a ray of the sun or a drop of rain to touch anybody passing along it. I started to hunt for this wonderful path, but the reader will perhaps not wonder at my failure to find it to this day.

Town bred as I was, I had never seen a rice-field, and I had a charming portrait of the cowherd boy, of whom we had read, pictured on the canvas of my imagination. I had heard from Satya that the Bolpur house was surrounded by fields of ripening

rice, and that playing in these with cow-herd boys was an everyday affair, of which the plucking, cooking and eating of the rice was the crowning feature. I eagerly looked about me. But where, oh where was the rice-field on all that barren heath? Cowherd boys there might have been somewhere about, yet how to distinguish them from any other boys, that was the question!

However it did not take me long to get over what I could not see,—what I did see was quite enough. There was no servant rule here, and the only ring which encircled me was the blue of the horizon which the presiding goddess of these solitudes had drawn round them. Within this I was free to move about as I chose.

Though I was yet a mere child my father did not place any restriction on my wanderings. In the hollows of the sandy soil the rainwater had ploughed deep furrows, carving out miniature mountain ranges full of red gravel and pebbles of various shapes through which ran tiny streams, revealing the geography of Lilput. From this region I would gather in the lap of my tunic many curious pieces of stone and take the collection to my father. He never made light of my labours. On the contrary he waxed enthusiastic.

"How wonderful!" he exclaimed. "Wherever did you get all these?"

"There are many many more, thousands and thousands!" I burst out. "I could bring as many every day."

"That *would* be nice!" he replied. "Why not decorate my little hill with them?"

An attempt had been made to dig a tank in the garden, but the subsoil water proving too low, it had been abandoned, unfinished, with the excavated earth left piled up into a hillock. On the top of this height my father used to sit for his morning prayer, and as he sat the sun would rise at the edge of the undulating expanse which stretched away to the eastern horizon in front of him. This was the hill he asked me to decorate. I was very troubled, on leaving Bolpur, that I could not carry away with me my store of stones. It is still difficult for me to realise that I have no absolute claim to keep up a close relationship with things, merely because I have gathered them together. If my fate had granted me the prayer, which I had pressed with such insistence, and undertaken that I should carry this load of stones

about with me for ever, then I should scarcely have had the hardihood to laugh at it to-day.

In one of the ravines I came upon a hollow full of spring water which overflowed as a little rivulet, where sported tiny fish battling their way up the current.

"I've found such a lovely spring," I told my father. "Couldn't we get our bathing and drinking water from there?"

"The very thing," he agreed, sharing my rapture, and gave orders for our water supply to be drawn from that spring.

I was never tired of roaming about among those miniature hills and dales in hopes of lighting on something never known before. I was the Livingstone of this undiscovered land which looked as if seen through the wrong end of a telescope. Everything there, the dwarf date palms, the scrubby wild plums and the stunted jambolans, was in keeping with the miniature mountain ranges, the little rivulet and the tiny fish I had discovered.

Probably in order to teach me to be careful my father placed a little small change in my charge and required me to keep an account of it. He also entrusted me with the duty of winding his valuable gold watch for him. He overlooked the risk of damage in his desire to train me to a sense of responsibility. When we went out together for our morning walk he would ask me to give alms to any beggars we came across. But I never could render him a proper account at the end of it. One day my balance was larger than the account warranted.

"I really must make you my cashier," observed my father. "Money seems to have a way of growing in your hands!"

That watch of his I wound up with such indefatigable zeal that it had very soon to be sent to the watchmaker's in Calcutta.

I am reminded of the time when, later in life, I was appointed to manage the estate and had to lay before my father, owing to his failing eyesight, a statement of accounts on the second or third of every month. I had first to read out the totals under each head, and if he had any doubts on any point he would ask for the details. If I made any attempt to slur over or keep out of sight any item which I feared he would not like, it was sure to come out. So these first few days of the month were very anxious ones for me. As I have said, my father had the habit of keeping everything clearly before his mind.

—whether figures of accounts, or ceremonial arrangements, or additions or alterations to property. He had never seen the new prayer hall built at Bolpur, and yet he was familiar with every detail of it from questioning those who came to see him after a visit to Bolpur. He had an extraordinary memory, and when once he got hold of a fact it never escaped him.

My father had marked his favourite verses in his copy of the *Bhagavadgita*. He asked me to copy these out, with their translation, for him. At home, I had been a boy of no account, but here, when these important functions were entrusted to me, I felt the glory of the situation.

By this time I was rid of my blue manuscript book and had got hold of a bound volume of one of Lett's diaries. I now saw to it that my poetising should not lack any of the dignity of outward circumstance. It was not only a case of writing poems, but of holding myself forth as a poet before my own imagination. So when I wrote poetry at Bolpur I loved to do it sprawling under a young coconut palm. This seemed to me the true poetic way. Resting thus on the hard, level gravel in the burning heat of the day I composed a martial ballad on the "Defeat of King Prithwi." In spite of the superabundance of its martial spirit, it could not escape an early death. That bound volume of Lett's diary has now followed the way of its elder sister, the blue manuscript, leaving no address behind.

We left Bolpur and making short halts on the way at Sahelganj, Dinapore, Allahabad and Cawnpore we stopped at last at Amritsar.

An incident on the way remains engraved on my memory. The train had stopped at some big station. The ticket examiner came and punched our tickets. He looked at me curiously as if he had some doubt which he did not care to express. He went off and came back with a companion. Both of them fidgetted about for a time near the door of our compartment and then again retired. At last came the station-master himself. He looked at my half-ticket and then asked,—

"Is not the boy over twelve?"

"No," said my father.

I was then only eleven, but looked older than my age.

"You must pay the full fare for him," said the station-master.

My father's eyes flashed as, without a word, he took out a currency note from his box and handed it to the station-master. When they brought my father his change he flung it disdainfully back at them, while the station-master stood abashed at this exposure of the meanness of his implied doubt.

The golden temple of Amritsar comes back to me like a dream. Many a morning have I accompanied my father to this *Gurudwar* of the Sikhs in the middle of the lake. There the sacred chanting resounds continually. My father, seated amidst the throng of worshippers, would sometimes add his voice to the hymn of praise, and finding a stranger joining in their devotions they would wax enthusiastically cordial, and we would return loaded with the sanctified offerings of sugar crystals and other sweets.

One day my father invited one of the chanting choir to our place and got him to sing us some of their sacred songs. The man went away probably more than satisfied with the reward he received. The result was that we had to take stern measures of self-defence,—such an insistent army of singers invaded us. When they found our house impregnable, the musicians began to waylay us in the streets. And as we went out for our walk in the morning, every now and then would appear a *Tambura*,* slung over a shoulder, at which we felt like game birds at the sight of the muzzle of the hunter's gun. Indeed, so wary did we become that the twang of the *Tambura*, from a distance, scared us away and utterly failed to bag us.

When evening fell, my father would sit out in the verandah facing the garden. I would then be summoned to sing to him. The moon has risen; its beams, passing through the trees, have fallen on the verandah floor; I am singing in the Vahaga mode:

"O Companion in the darkest passage of life....."

My father with bowed head and clasped hands is intently listening. I can recall this evening scene even now.

I have told of my father's amusement on hearing from Srikantha Babu my maiden attempt at a devotional poem. I am reminded how, later, I had my recompense.

* An instrument on which the keynote is strummed while singing.

On the occasion of one of our *Magh* festivals several of the hymns were my composition. One of them was :

"The eye sees thee not, who art in the pupil of every eye....."

My father was then bed-ridden at Chinsurah. He sent for me and my brother Jyoti. He asked my brother to accompany me on the harmonium and got me to sing all my hymns one after the other,—some of them I had to sing twice over. When I had finished he said :

"If the king of the country had known the language and could appreciate its literature, he would doubtless have rewarded the poet. Since that is not so, I suppose I must do it." With which he handed me a cheque.

My father had brought with him some volumes of the Peter Parley series from which to teach me. He selected the life of Benjamin Franklin to begin with. He thought it would read like a story book and be both entertaining and instructive. But he found out his mistake soon after we had started. Benjamin Franklin was much too business-like a person. The narrowness of his calculated morality disgusted my father. In some cases he would get so impatient at the worldly prudence of Franklin that he could not help using strong words of denunciation.

Before this I had nothing to do with Sans-

krit beyond getting some rules of grammar by rote. My father started me on the second Sanskrit reader at one bound leaving me to learn the declensions as we went on. The advance I had made in Bengali* stood me in good stead. My father also encouraged me to try Sanskrit composition from the very outset. With the vocabulary acquired from my Sanskrit reader I built up grandiose compound words with a profuse sprinkling of sonorous 'm's and 'n's making altogether a most diabolical medley of the language of the gods. But my father never scoffed at my temerity.

Then there were the readings from Proctor's Popular Astronomy which my father explained to me in easy language and which I then rendered into Bengali.

Among the books which my father had brought for his own use, my attention would be mostly attracted by a ten or twelve volume edition of Gibbon's Rome. They looked remarkably dry. "Being a boy," I thought, "I am helpless and read many books because I have to. But why should a grown up person, who need not read unless he pleases, bother himself so?"

* A large proportion of words in the literary Bengali are derived unchanged from the Sanskrit. Tr.

Translated by

SURENDRANATH TAGORE.

THE PROGRESSIVE RULER OF NABHA

BY SAINT Nihal Singh.

NABHA—one of the important Indian States in the Punjab—shows how a few years of rule by a modernised Maharaja can result in increased administrative efficiency. During the four years that the present Ruler, His Highness Maharaja Ripudaman Singh *Malvendar Bahadur*, has been in power, the executive machinery has been remodelled, the intervention of the Maharaja in judicial matters has ceased, primary education has been made free, and steps are being taken to introduce compulsory education. All persons who are interested in the advance-

ment of India by Indians should know of the influences that have moulded the character of the Maharaja Sahib, and of the policies that he is pursuing.

Maharaja Ripudaman Singh was born in 1883. His father, His Highness Maharaja Hira Singh *Malvendar Bahadur*, was 40 years old at the time and hailed the arrival of his heir with great joy.

Maharaja Hira Singh was, in his own way, a great man. He had not troubled to learn any Western language, nor had he adopted alien ways of life. He knew *Gurmukhi* and had made a study of Sikh

and other Punjabi literature as few persons have done. He also had spent much time and taken great pains to acquire wisdom from Hindi and Sanskrit literature. The casual references that he made, in private conversation, to episodes that occurred in our Motherland in ancient days amazed me more than once, and showed to all who came in personal contact with him that his mind was a repository of the precious heritage that our forefathers have left us.

His Highness was a great patron of learning. A large number of scholars, especially those versed in sacred literature and astrology, and poets, received regular stipends or handsome presents from him. I am sure that without his generous assistance Max A. Macauliffe would not have been able to complete "The Sikh Religion"—the invaluable work that he left us. The Maharaja Sahib asked me, in 1910—not long before he died—to undertake to write in English a history of the Sikhs, and said he would meet all expenses incurred in connection with it if I would take up the work—an offer I could not accept at the time, owing to my other commitments.

Maharaja Hira Singh knew how to preserve peace throughout his State, which, according to the Census of India, 1911, had an area of 928 square miles, and a population of 248,887 persons. He looked upon his subjects as his children, and ruled them like a patriarch.

If he learned that some one was misbehaving, he would at once send for him, ask him what he meant by his misconduct, and reprimand him as severely as the circumstances required. People knew that His Highness could punish as well as give stipends and presents; and censure from him was nearly always sufficient to bring an erring individual to his senses. Whenever it came to his notice that a husband and wife were having domestic difficulties, he would make them come to him and bring about a reconciliation on the spot.

He did not believe in permitting litigation to be expensive, or justice to be delayed. He would often send for a file and the persons involved in the case, and settle the matter in the course of a few minutes. He told me that he lived near the court-house primarily so that he could see to it that justice was dealt out speedily.

His Highness was a great builder. Architects were constantly at work putting up new structures and remodelling old

ones. There used to be a story current relating to him to the effect that a designing contractor had bribed an astrologer to predict that the Maharaja Sahib would die the moment he stopped building. I once committed the *faux pas* of repeating this tale to His Highness. He laughed heartily and dismissed the subject, thereby furnishing me with the true measure of the man. Why do foreigners allege that our Rajas do not possess a sense of humour?

Whatever he may have spent upon building dharmshalas, sinking wells, and constructing other public works, and whatever he may have given to scholars and saints, His Highness spent very little upon himself. He lived very simply—far more so than many of our landed magnates and "educated Indians" do. His fare was plain, and not much varied. His every-day dress was inexpensive. His favourite fabric was white muslin; and his one extravagance was that his garments should always be snow-white. Foreigners who talk of the pomp of Maharajas in season and out of season, surely display their ignorance of the real facts.

Living so simply as he did himself, His Highness could not bear to see any one rioting in luxury. As a necessary corollary to this, he paid his highest officials small salaries. The administration of Nabha, as conducted by Maharaja Hira Singh, was inexpensive, and the tax-payer bore a light burden. As His Highness's eye saw all, and his ears heard all, the officials did not dare to oppress his subjects by exacting bribes from them. Nabha, in consequence, was a happy State—though from the modern point of view its administration was old fashioned in the extreme.

Such was the man and the Ruler who brought up the present Maharaja of Nabha. As can be imagined, the Tikka Sahib (Heir Apparent), as he was then called, learned to love purity of character, knowledge, and simple living from his infancy upwards. His father's example and precept taught the future Maharaja that his whole aim should be to devote all his time, talents, and energy to promote the good of those among whom he was born and over whom he would rule in the fulness of time.

The time in which the Tikka Sahib first opened his eyes upon the world was far different from that in which his father had been born. The Punjab had not yet been

Maharaja Hira Singh Malvender Bahadur
the late Maharaja of Nabha.

annexed by the British when Raja Hira Singh came into the world, and Western ideas had not penetrated into that part of India. When the present Maharaja was born, however, the Punjab had been a part of British India for more than a generation. The Punjab University had been established, and many Punjabis had graduated from schools and colleges. Western books and papers were being read by persons who could decipher them, and Occidental notions were influencing even those who did not know English, through translations of English books and by other means. As a consequence of these changes, the Tikka Sahib of Nabha enjoyed educational advantages which his father never had.

The Tikka Sahib showed a great desire to assimilate both Eastern and Western culture, and a great capacity for acquiring useful knowledge. In the course of a few years he learned to write well in Punjabi and English. He had acquired such a grasp of the Indian situation that in 1906

H. H. Maharaja Ripudaman Singh Malvender
Bahadur, Maharaja of Nabha.

the Lieutenant Governor of the Punjab had him appointed as an Additional Member of the Imperial Legislative Council.

Many readers will remember how this appointment was considered at the time to be a device on the part of a Local Government to appoint an Indian who would be an echo of the British-Indian bureaucracy. The Tikka Sahib had not been long in the Council when all unprejudiced persons were compelled to change such views. He at once showed the desire to represent Indians. He exerted his influence to advance Indian interests in every manner possible. He associated with men like the Hon. Mr. Gopal Krishna Gokhale, instead of cliquing with aristocrats. I shall quote here what he recently wrote about his companionship with Mr. Gokhale in and out of the Council:

"I had the privilege of counting the late lamented Mr. K. Gokhale among my personal friends and of being associated with him for some time as a colleague in the Imperial Legislative Council. I thus often came in touch with his charming and brilliant personality and had the opportunity of observing the

great powers of head and heart which, in his comparatively short public career, so thoroughly won for him the confidence and affection of his countrymen. India has, indeed, suffered an irreparable loss in his premature death, and it is but fit and proper that the memory of that true and great patriot be perpetuated in a suitable manner by his grateful countrymen."

The Tikka Sahib's term in the Legislative Council, extending from 1906 to 1908, enabled him to extend his knowledge, to come in close contact with Indian leaders of thought and progressive movements.

The Tikka Sahib left India for a tour in Europe shortly after his work in the Council had ended. His residence in England, during which he had personal audience of His Majesty the King-Emperor and met many eminent men and women, and investigated numerous institutions, helped to widen his intellectual horizon.

He had gone to Europe accompanied by his wife. It is not realized by many persons that the Maharani Sahiba is a most cultured woman, and has had a great influence upon her husband. I know, through personal knowledge, how her father, Sardar Gurdial Singh Man, took pains to educate Her Highness. A relative of mine acted as her tutor for some time, many years ago, and I had the opportunity of seeing her at her work more than once. Her Highness speaks English fluently, and is very fond of reading Eastern and Western books. Her stay in England enabled her to see much of Western life, and made her a most congenial companion to His Highness the Maharaja Sahib.

Every one who had come in contact with the Tikka Sahib confidently expected that he would modernize the administration of Nabha as soon as he came into power. What has happened since his elevation to the throne of his fathers on December 25, 1911, has justified such hopes. His Highness has refrained from making violent changes—and quite wisely. He, however, has been steadily modifying the State organization.

His Highness has been aiming at making the public services of Nabha efficient by appointing duly qualified men to hold the various posts, remunerating them adequately, and assuring their future. He wishes to employ his own subjects, as far as is practicable; and is taking measures to enable promising young men to fit themselves to occupy positions of responsibility.

The administrative exigencies of Nabha required not only men with higher qualifications than those who had been employed before, but also necessitated an increase in the number of officials. His Highness has considerably strengthened the revenue service by increasing the number of Tehsildars and Naib Tehsildars. This much needed reform has had the effect of saving the peasant proprietors from taking long journeys to the headquarters of Tehsils.

Every department of the State shows the effect of His Highness's personal interest in it. Take, for instance, the one that controls finance. Great changes have been inaugurated in this department. A qualified official has been appointed Accountant General and placed in charge of the State Treasuries. In order to make the system of checking accounts effective, the Accountant General has been given an independent status.

The judicial department also has been greatly improved. A High Court has been established. Men versed in law are being appointed to act as judges, and are left alone by His Highness to make systematic inquiries into civil and criminal cases, carefully to weigh evidence, and to arrive at an impartial decision. The policy of arresting procedure at any stage has been completely abandoned. The Maharaja Sahib limits his judicial work to revision of the judgments passed by the High Court in important cases, or where an appeal is preferred.

The laws of the State are being codified by an experienced officer who holds the degree of Bachelor of Law.

A qualified engineer has been placed in charge of the Public Works. Irrigation canals and wells are being constructed. Schemes for water works are under consideration. The Maharaja Sahib is especially anxious to promote sanitation, agriculture, industry, and commerce.

Nothing is so dear to the heart of the Maharaja Sahib as the education of his people. He deplores the illiteracy of his subjects—only 7,143 out of the 248,887 inhabitants of the State could read and write in 1911; and he longs for the day when it will have entirely disappeared. He made primary education free in 1913. Speaking, some time after taking this action, to a party of students who had presented him with an address, His Highness said that he intended to make elementary

Installation Ceremony according to Sikh Usages of H. H. Maharaja Rup Lalman Singh
Malvendar Bahadur Maharaja of Nabha

instruction compulsory. I quote the following from the speech that he made on this occasion, as it shows his ideas on education and kindred matters :

"It gave me great pleasure to make elementary instruction free in my State the other day, and it is my aim to make it compulsory as well in due course. In advanced foreign countries the duty of the State in the matter of providing education has been realized, and in India progressive States, like Baroda and Mysore, are following this noble example.

But we are bound to one another by reciprocal duties. If you parents and the State have certain duties towards you you also owe something in return to your parents and the State. I view you with special interest because you have latent powers which if properly developed and carefully applied are sure to bring about great results, and I hope you will prove an honour to your country and the Government when it comes your turn to play your part in the affairs of this world. I assure you that every reasonable help which you may deserve by your merits will be readily given to you by the State."

His Highness attaches special importance to the education of girls, believing that the diffusion of knowledge among women prepares them intelligently to discharge the functions of motherhood, and thereby exerts an enlightening influence upon the rising generation. He has

recently established a girls' school at his capital, and has set apart scholarships for girls.

The Maharaja Sahib is also interested in giving higher education to his subjects. He has inaugurated a scheme of awarding scholarships to promising young men to enable them to pursue studies at various colleges in the Punjab. I understood, some years ago, that he had in mind a scheme for sending students abroad, which I have no doubt he will put into operation shortly.

The Maharaja Sahib, like his father, encourages learning outside the State. Both gave large benefactions to the Girls' School at Perczepur founded by Bhai Takht Singh and Bibi Harnam Kour, the latter dying some years ago after working indefatigably for the advancement of Punjabi women. The present Maharaja also gave a liberal donation to the Girls' School at Bhasaur (Punjab).

His Highness's patronage of learning is of a catholic character. This was evidenced by the lakh of Rupees that he gave, some time ago, to the Hindu University

The remarks that he made at the time show his enlightened policy. He said in effect that he would have donated a larger sum if the educational needs of his subjects had not had a prior claim upon the State Treasury.

In order to educate his subjects in the science of self-government, the Maharaja Sahib has constituted District and Advisory Committees. The District Committees are elected by the people. It is their duty to help the District Officers (Nazims) to perform their administrative work. They send representatives to the Central Committee. His Highness expects to develop these bodies into real self-governing institutions in course of time.

Maharaja Ripudaman Singh does not believe in intervening in the administration of his State except in cases of flagrant mismanagement. He considers that carefully selected officials should be given scope for exercising their initiative and bearing responsibility, their powers, privileges, and limitations being strictly defined. He thinks that the functions of a Maharaja should be to keep a watchful eye on the work of his officials, to counsel them in times of doubt and difficulty, to guide them when occasion arises, and to decide issues of the greatest importance involving the establishment of new principles and precedents.

His Highness has abandoned the policy that prevailed before his accession of departments requiring the Maharaja's sanction to items of expenditure that had been incorporated in the Budget. I may note, *en passant*, that he has given increased

powers to the Executive Council which consists of two Members, Khan Sahib Mohamed Munawar Ali Khan and Sardar Hazara Singh. The Executive Council does not interfere in judicial matters.

In order to insure against oppression by officials, His Highness makes frequent tours through different parts of his State, and gives every opportunity to persons with grievances to tell him their troubles. Anyone who has a complaint to make can write to him and be sure that his letter will be opened and read by the Maharaja himself, and inquiry immediately made, and such redress given as circumstances may justify.

So far I have spoken of Maharaja Ripudaman Singh as an administrator. To what has been written must be added a few sentences showing his work as a man. His Highness lives a simple and useful life, and is a total abstainer. An example such as his cannot but uplift those amongst whom he moves. From his early manhood he has been a social reformer. This was amply acknowledged when the Indian Social Conference invited him to preside over their deliberations at their Lahore session in 1909. His Highness wants to do away with caste prejudices, the purdah system, early marriage, enforced widowhood, polygamy, and like social abuses. Though he has no son and heir, he has refused to use that pretext to marry a second wife.

It is fortunate for Nabha that it has so progressive a Ruler as His Highness Maharaja Ripudaman Singh.

"THE ZOROASTRIAN PERIOD OF INDIAN HISTORY"

I.

SO reads the title of a paper read before a learned society and published in their literary organ, noted for the originality of the articles which find place therein. And above all, proceeding as it does from the pen of a scholar who had been trained by the dons of three of the foremost nations of the modern world, Japan, America and Germany, it has created an unique interest among scholars.

The author of the paper, Dr. D. Brainerd Spooner, has already made a name by the discovery of the Kanishka Chaitya and the relics of Buddha at Peshawar*. Students

* His excavations at Sabri-Bahhal have been on the whole successful and at present he has the unique distinction of being the only Sanskrit scholar among the European members of the Archaeological Department. Dr. Spooner is the Superintendent of the Eastern Circle of the Archaeological Department and one of the Secretaries of the Bihar and Orissa Research Society.

"THE ZOROASTRIAN PERIOD OF INDIAN HISTORY"

of Indian history are familiar with such a conventional division as the Indo-Greek or the Scythian period; but a Zoroastrian period, I dare say, opens up a new vista of research and speculation. Those who have wandered far and wide in the unknown wilds of Indian antiquity might, perhaps, have come across some stray specimens reminding them of the ancient Persian civilisation of the Achaemenidæan period. But these are being commonly taken as evidences of the Persian occupation of the north-western regions of India. Their scarcity, hitherto, has prevented Orientalists from making any serious attempt at building up any sort of theoretical speculation. Dr. Spooner's exposition of this new period has therefore been awaited with great interest by the majority of serious students; and it was surmised that his discoveries would, at last, link Indian history with the general history of the Ancient East. So far Indian history had been an isolated study and India could not be assigned a proper place in the history and chronology of the great Oriental nations of antiquity. It was as Elphinstone had put it nearly a century ago, "no date of Indian history could be determined with exactitude before Alexander's invasion."

Dr. Spooner's learned paper has been printed in two instalments in the *Journal of the Royal Asiatic Society of Great Britain and Ireland*, for 1915. Beyond a general outburst of journalistic feeling any serious attempt does not seem to have been made either in this country or in Europe to consider calmly the conclusions of the learned author, or to examine the facts and methods, discovered and employed by him to arrive at these conclusions. We know from the inscriptions of the emperors of the Achaemenidæan dynasty of Persia as well as from the sober statements of the Hellenic historians that a portion of the north-western regions of India was included in the Persian Empire down to the conquest of Alexander the Great. These regions were divided into a number of Satrapies;* the subject races of Indians paid their taxes in coined silver money and the Indian regiments fought under Persian Generals in the Greco-Persian Wars.† These facts have been put beyond doubt by the corroborating statements of foreign

historians and epigraphical evidences. And perhaps we may safely point to the history of this period as a real and a tangible beginning. But for all that, it is the darkest period of Indian history. A discussion of the materials available for the historical study—nay, for the reconstruction of the history itself—cannot fail to be of passing interest to all those who are labouring under immense difficulties to throw light on this obscure period. A fresh interest has also gathered round this topic by the excavation of the historic site of Pataliputra under the supervision of the author of the paper. The accounts published from time to time in the daily papers of the numerous and valuable finds unearthed in the excavated area and mostly assigned by the author of the paper to the period under discussion are partly responsible for the great sensation which the theory has created among the scholarly public.

As Dr. Spooner's theory is entirely based on the results of the Pataliputra excavations, we should examine them thoroughly before proceeding to discuss his modes and methods. About a quarter of a century ago the ruins of Pataliputra were excavated by Lieut-Col. L. A. Waddell and the late Mr. Purna Chandra Mukherji. In opening the discussion, Dr. Spooner very gracefully introduces Dr. Waddell's name but omits to mention the part played by Mr. Mukherji. It is well-known that the first excavations of Pataliputra were mainly conducted by Mr. Mukherji and Dr. Waddell's share in it was very little.

Dr. Waddell found some "fragments of polished stone with a curving surface, which he rightly judged to be portions of Maurya pillars." We know from the statements of the Chinese pilgrims "that Asoka erected at least two inscribed pillars in his capital." Dr. Waddell thought that he had discovered some fragments of the one or the other of those pillars. Dr. Spooner says that when the excavations were begun "the Department was not without hope of proving that Colonel Waddell was right."

The second excavation of Pataliputra was begun on the 6th of January, 1913. Numerous fragments of sandstone with curved and polished surface were found in the excavated spot, a field lying between "two tanks" in the immediate neighbourhood of Kumrahar, a village

south of the modern city." The conclusion to which Dr. Spooner has been led by the number of these fragments is stated in the following terms :—

"It soon became apparent, then, from the multiplicity, varied texture and small diameter of our pillar fragments that they could not have emanated from an edict column. I, therefore, assumed that some Mauryan building must have been situated here and altered my method of work to suit this changed hypothesis."

This was the first false step that he took. The learned excavator should not have altered the method of his work to suit a mere hypothesis. Pre-conceived notion and hypothetical assumption, I am afraid, have no place in sober archaeology. Day-dreams are for poets and not for archaeologists to indulge in. A thorough antiquarian should have imprinted in his mind the words of Lord Acton and of Mr. Flinders Petrie. What one would believe is that the learned excavator of Pataliputra in a fit of forgetfulness was thrown off his guard. The glamour of the ancient city distorted the vision of the learned Doctor and so his further observations became incapable of being accepted *in toto* by the scientific students of history.

I had the good fortune of visiting the site along with hundreds of other laymen. I find no reason whatsoever in support of the learned Doctor's theory. The first year's excavation had yielded a number of fragments of polished sandstone pillars, which had been piled up at regular distances with a wooden or bamboo rod over each pile. The fragments were certainly not discovered in that state. They have been put together at these places with some object. One of the assistants at work kindly pointed out to me that these little piles marked the spots where the pillars of the columnar hall were supposed originally to stand. The absence of the columnar hall or any indication of it left the visitor non-plussed. But the gentleman's explanation of the next object of interest cleared his vision. It was a section of the virgin soil, mostly Gangetic alluvium, in which there was a solid column of blackish grey ash. The section of the column of ash is very neat. It appeared as if somebody had sunk a well and filled it up with ashes. Here and there were found one or two pieces of brick or of polished fragments of a stone column. This was all that I saw. On the border of the excavated ground there were some

tents, and a few fragments of stone carving were found lying scattered round it. I found no clear evidence which pointed undoubtedly to the existence of a pillared hall on the excavated spot. I had better quote Dr. Spooner's explanation of the columns of ashes. In the first place he begins by saying that "the actual structure of the Mauryan hall has almost, if not entirely, disappeared."*

Then he goes on to say that it is at all events certain that the Mauryan building was buried with 8 feet of earth over its floor before the fire occurred which finally destroyed it. This refers to the alluvial soil in which the columns of the ash have been found. Then comes the explanation of these circular ash columns †

"It is certain that the tubular funnels of ash which we now find descending vertically from the ash stratum are nothing more than the holes left by the pillars which originally stood at these points."

It should be noted here that a belt of grey ash covers the entire surface of the ground above the level of the vertical columns of ash in question. Dr. Spooner's theory is explained by a diagram at the bottom of p. 46 of the Report of the Archaeological Survey, E. C., 1913-14. It seems quite clear from Dr. Spooner's statements that his theory about the pillared hall rests more on these circular wells filled with ashes and less on the number of fragments with curved sides. His idea is that the pillars have sunk below leaving these cylindrical holes in the soil which have been immediately filled up with ashes. Dr. Spooner has already conjured up a vision of the Mauryan pillared hall and attempted to reconstruct its plan.

"It should be noted furthermore that for purposes of tracing and reconstructing the Mauryan pillared hall it is really not a matter of vital importance whether the columns have sunk or not. So long as we can be perfectly sure that in any event these vertical ash funnels are the equivalents of Mauryan stone pillars, all that is necessary for a reconstruction of ground plan of these pillars is to note and record the position of these ash funnels."‡

Now let us go back in our argument. Dr. Spooner was led by the number of fragments of polished stone discovered at this place to assume that a Mauryan building

* An. Rep., Arch. Surv. of Ind., E. C., for 1913-14, p. 45.

† *Ibid.* p. 48.

‡ *Ibid.* p. 48.

existed here. The fragments do not come from a monolithic obelisk.*

The learned author of the paper says that these fragments could not have emanated from an edict column, in total disregard of the fact that such columns have been mentioned by the Chinese travellers.

This minor discrepancy should be disregarded as the fragments found had been thought to have come from more than two columns. According to the hypothesis of the excavator, here stood a hall with several rows of pillars, the position of which are indicated by circular shafts in the soil filled with ashes. It should be noted here that besides these fragments Dr. Spooner has discovered only a half or a third of one of these entire columns. The discovery of this larger fragment is important, as it proves that one at least of the columns was not led by its weight to sink so deep as to make it impossible to recover it at present. Dr. Spooner is perhaps right in thinking that the columns were not in position when the Gupta builders cleared the ground for building purposes.† In 1913-14 his idea was that the upper parts of these pillars were destroyed by the expansion of the copper-bolts when the fire occurred. The lower parts were encased in the alluvial muddy soil and escaped destruction.‡

"When the wooden foundations decayed, the great weight of these pillars forced them to sink vertically." In 1915 when the excavations had spread over a considerable extent Dr. Spooner changed his opinion about this alluvial soil. The excavation has proved that this alluvial soil was not spread over the entire surface and consequently it could not be a deposit of river mud due to a flood. Moreover, careful examination had disclosed particles of straw (*blusa*) mixed up with clay. So Dr. Spooner's second opinion is that this alluvial soil was the remain of a *kutch* brickwork with which the hollow space enclosed by the high plinth or stylobate was filled. Perhaps it did not occur to the learned gentleman that a field of grass when flooded and covered with silt may exhibit traces or particles of straw even hundreds of decades afterwards. But even

if we accept his explanation and take it for granted that the level of the "blue clay" is really the ground level, that there was a high plinth in the construction of the supposed column or hall as in many Persian buildings of the Achaemenidae period, though the Hall of a Hundred Columns had none, and that the mass of the alluvial clay is really the remains of a *kutch* brickwork laid above the wooden foundations, to fill in the hollow space between the plinths on all sides, even then one question remains unanswered; namely, that whether these pillars were originally set up by being inserted partially into this mass of *kutch* brickwork. This the learned excavator does not seem to have tackled. The polished surface of the pillars were certainly not intended to have been left underground. The evidence of other Asoka monoliths is against this. The lower ends of other monoliths which were intended to be covered with earth or brickwork are rough and unpolished. Therefore all these columns must have been unprotected by this belt of clay at the time of the occurrence of the fire and must have been destroyed totally. Dr. Spooner admits the original position of the columns. He says, "originally the columns and sculptures stood on the top of the stylobate."*

But even then he does not give up his theory of the sinkage of the columns. He says: "It will be observed that incidentally the theory of sinkage is confirmed." The learned gentleman admits that originally the columns stood upon the plinth or stylobate and were not imbedded in its clayey core. Therefore it must be admitted that the clay did not protect any portion of the polished shafts at the time of the fire, which must have split these columns into fragments. Therefore it is legitimate to conclude that they could not have been inserted into the circular clayey shafts now filled by the superimposed belt of ashes. It may also be observed that Dr. Spooner has not yet succeeded in recovering any of these columns below the ground level (the original ground level which according to him is the line of "blue clay"), and has offered various explanations for their non-recovery. It seems clear, therefore, even to the unini-

* Journ. of the Roy. As. Soc., 1915, p. 64.

† An. Rep. Arch. Surv. Ind., 1913-14, p. 50.

‡ *Ibid.*

tiated that the circular horizontal shafts can have no possible connection with the position of the columns of the hall, if there had been, as the learned Doctor admits, a high stylobate filled with kutchra bricks and the columns stood above it. Hence the position of the columns in the supposed hall cannot be determined from those shafts. It would not at all be safe to determine the position of the columns from the position of the neatly stacked piles of polished fragments which, Dr. Spooner says, are found above each of these shafts. When a pillar of stone is split by fire or the action of intense heat, the fragments do not fall in neat piles. They would be scattered far and wide and would be thrown with great force. I would invite the learned scholar to test the truth of this statement by a practical demonstration. "It is not easy to believe," he says, "that vandals would have had the courtesy, not only to dig and refill these cavities with the nicety now observable, but further to collect the fallen fragments of their ravished pillars and stack them in such neat piles, precisely above their pits, as to admit of our tracing

the building from a measurement of these accumulations."* Whoever they might have been, whether vandals or not, it is certain that somebody kept the fragments arranged in piles above these ash-pits. None would dare admit that the action of fire led these fragments to pile themselves so neatly for the benefit of a twentieth-century excavator. We owe the solution of the problems of these stacks and the ash-pits to the ingenuity of the learned excavator of Pataliputra. It is certain that the excavations of Pataliputra have not revealed either the plan or the indication of a "pillared hall" and I believe that the charm and the glamour of Asoka's name and his ancient capital added to personal enthusiasm carried to excess have affected the judgment of the unemotional archaeologist. The excavations at Pataliputra have failed. They have failed to produce any important result like those of Sarnath or of Taxila. It has failed like other excavations carried on by the Archaeological Department in Bihar, whether at Rajgir, at Bosrah or at Patna.

NIMROD.

* An. Rep. A. S. R., I. 1913-14.

THE WOODSMAN'S BATTLE-AXE

A MARATHA MOTHER'S BALLAD

VERSIFIED BY FLORENCE AND AGNES BARKER.

Victorious stand the foemen hold
On conflict's bloody field,
Deserting the Maratha cause,
Must their own Peshwa yield.
While fast the news spreads o'er the land,
And all bemoan the gallant band
Hear on the wooded Diva Ghauts
The aged mother's cry :
"Would that my long dead lord were here"
This were the time to die,
And with the heroes fall and bleed
To help his country in her need."
Restless and sad, with tottering step
She seeks the forest glade,
Where plies her son the woodman's axe,
In manhood's strength array'd.
"Come forth, nor stay to fell yon tree ;
Thy country's cause hath need of thee
"Thick as the trees in Diva's wood
The foes around thee stand.
Arise ! for now their traitor heads
Must fall beneath thy hand.
And long the minstrels' songs shall tell
Of the hero who served his country well
Forthwith towards the battle field
The woodman's thoughts were turn'd,
And, kindled by his mother's words,
A fire within him burn'd ;
"With this axe for thy sword and spear
No foeman's *hatyar* needst thou fear."

Once more victorious on the field
The gallant foemen stand,
And Ashta's plain is strewn with dead,
The flower of all the land.
While sorrowing *Gondhals* tell the tale
Of sad Maratha mothers' wail.
See o'er the dismal battle field
The aged mother bends,
Scanning each face, to which the night
A gruesome terror lends
Behold ! at length she finds him lain
Amongst the foes his axe has slain.
For one brief space a mother's grief
Has overwhelmed her heart ;
Then "God be praised" she cries, "My son
Has nobly played his part"
His country needs no braver men
To bring her to her own again !
"Go, woodsman-warrior, valiant son,
And live among the blest ;
This bloodstain'd axe thou wieldst so well
Shall in *Devara* rest ;
That evermore its blade may tell
Of the hero who served his country well '"

(N. B. According to the *Gondhal* song, the descendants of the hero's mother were reduced to such straits in time of famine in the Maratha country that they were obliged to sell the axe by auction; the valuable heirloom realized only one and a half annas !)

MASHI

TRANSLATED FROM THE BENGALI OF SIR RABINDRANATH TAGORE

By W. W. PEARSON.

“MASHI!” *

“Try to sleep, Jotin, it is getting late.”

“Never mind if it is. I have not many days left. I was suggesting that Mani should go to her father’s house.—I forget where he is now.”

“Sitarampur.”

“Oh, yes! Sitarampur. Send her there. She should not remain any longer near a sick man. She herself is not strong.”

“Just listen to him! How can she bear to leave you in this condition?”

“Does she know what the doctors—?”

“But she can see for herself! The other day she cried her eyes out at the merest hint of having to go to her father’s house.”

It is necessary to explain here that in this statement there was a slight distortion of truth, to say the least of it. The actual conversation that took place with Mani was as follows.

“I suppose, my child, you have got some news from your father? For I thought I saw your cousin Anath here.”

“Yes! Next Friday will be my little sister’s *annaprashan*† ceremony. So I’m thinking—”

“All right, my dear. Send her a gold necklace. It will please your mother.”

“I’m thinking of going myself. I’ve never seen my little sister and I want to ever so much.”

“Whatever do you mean? You surely don’t think of leaving Jotin alone? Haven’t you heard what the doctor says about him?”

“But he said that just now there’s no special cause for—”

“Even if he did, you can see his condition.”

* The maternal aunt is addressed as Mashi.

† The Annaprashan ceremony takes place when a child is first given rice. Usually it receives its name on that day.

“This is the first girl after three brothers, and she’s a great pet.—I have heard that it’s going to be a grand affair. If I don’t go, mother will be very—”

“Yes, yes! I don’t understand your mother. But I know very well that your father will be angry enough if you leave Jotin just now.”

“You’ll have to write a line to him saying that there is no special cause for anxiety, and that even if I go, there will be no—”

“You’re right there; it will certainly be no great loss if you do go. But mind, if I write to your father, I’ll tell him plainly what is in my mind.”

“Then you needn’t write. I shall ask my husband and he will surely—”

“Look here, child, I’ve borne a good deal from you, but if you do that, I won’t stand it for a moment. Your father knows you well enough, so you won’t be able to deceive him.”

When Mashi had left her, Mani lay down on her bed in a pet.

Her neighbour and friend came and asked what was the matter.

“Look here! What a shame it is! Here’s my only sister’s *annaprashan* coming and they don’t want to let me go to it!”

“Why! Surely you’re never thinking of going, are you, with your husband so ill?”

“I don’t do anything for him, and I couldn’t if I tried. It’s so deadly dull in this house, that I tell you frankly, I simply can’t bear it.”

“You are an extraordinary woman!”

“But I can’t pretend (as you people do) and look glum lest anyone should think ill of me.”

“Well, tell me your plan.”

“I must go. Nobody can prevent me.”

“Isss! What an imperious young woman you are!”

Hearing that Mani had wept at the mere suggestion of going to her father’s

house, Jotin was so excited that he sat up in bed. Pulling his pillow towards him he leaned back and said, "Mashi open this window a little and take that lamp away."

The still night, like a pilgrim of eternity, stood silently at the window; while the stars, witness through untold ages of countless death scenes, gazed in.

Jotin saw his Mani's face traced on the background of the dark night, and saw those two big dark eyes brimming over with tears, as it were for all eternity.

Mashi felt relieved when she saw him so quiet, thinking he was asleep.

Suddenly he started up and said, "Mashi, you all thought that Mani was too frivolous ever to be happy in our house. But you see now—"

"Yes, I see now, my Baba,* I was mistaken—but trial tests a person."

"Mashi!"

"Do try to sleep, dear!"

"Let me think a little, let me talk. Don't be vexed, Mashi!"

"Very well."

"Once, when I used to think I could not win Mani's heart, I bore it silently. But you—"

"No dear, I won't allow you to say that; I also bore it."

"Our minds, you know, are not clods of earth which you can possess by merely picking up. I felt that Mani did not know her own mind and that one day at some great shock—"

"Yes! Jotin, you are right."

"Therefore I never took much notice of her waywardness."

Mashi remained silent, suppressing a sigh. Not once, but often she had noticed Jotin spending the night on the verandah wet with the splashing rain, yet not caring to go into his bedroom. Many a day he lay with a throbbing head, longing, she knew, that Mani would come and soothe his brow, while Mani was getting ready to go to the theatre. Yet when Mashi went to fan him, he sent her away petulantly. She alone knew what pain lay hidden in that vexation. Again and again she had wanted to say to Jotin, "Don't pay so much attention to that silly child, my dear, let her

learn to want,—to cry for things." But these things cannot be said and are apt to be misunderstood. Jotin had in his heart a shrine set up to the goddess Woman and there Mani had her throne. It was hard for him to imagine that his own fate was to be denied his share of the wine of love poured out by that divinity. Therefore the worship went on, the sacrifice was offered and the expectation of a boon never ceased.

Mashi imagined once more that Jotin was sleeping, when he suddenly cried out,

"I know you thought that I was not happy with Mani and therefore you were angry with her. But, Mashi, happiness is like those stars. They don't cover all the darkness, there are gaps between. We make mistakes in life and we misunderstand, and yet there remain gaps through which truth shines. I do not know whence comes this gladness that fills my heart to-night."

Mashi began gently to soothe Jotin's brow, her tears unseen in the dark.

"I was thinking, Mashi, she's so young! how will she occupy herself when I am—?"

"Young, Jotin? She's old enough. I too was young when I lost the idol of my life, only to find him in my heart for ever. Was that any loss do you think? Besides, is happiness so absolutely necessary?"

"Mashi, it seems, as if just when Mani's heart shows signs of awakening, I have to—"

"Don't you worry about that, Jotin. Isn't it enough if her heart awakes?"

Suddenly Jotin recollected the words of a village minstrel's song which he had heard long before

"Oh my heart! you woke not when the man of my heart came to my door.

At the sound of his departing steps you woke up.

Oh you woke up in the dark!"

"Mashi, what is the time now?"

"About nine."

"So early as that! Why, I thought it must be at least two or three o'clock. My midnight, you know, commences from sundown. But why were you so anxious for me to sleep, then?"

"Why, you know, how late last night you kept awake talking; so to-day you must get to sleep early."

"Is Mani asleep?"

* Baba literally means Father, but is often used by elders as a term of endearment. In the same way "Ma" is used.

"Oh, no, she's busy making some soup for you."

"You don't mean to say so, Mashi? Does she—?"

"Certainly! Why, she prepares all your diet, the busy little woman."

"I thought perhaps Mani could not—"

"It doesn't take long for a woman to learn such things. When the need arises it comes of itself."

"The fish soup, that I had in the morning, had such a delicate flavour, I thought it was your preparation."

"Dear me, no! Surely you don't think Mani would let me do anything for you? You know she does all your washing herself. She knows you can't bear anything dirty about you. If only you could see your sitting-room, how spick and span she keeps it! If I were to let her haunt your sick-room, she would wear herself out. But that's what she really wants to do."

"Is Mani's health, then—?"

"The Doctors think she should not be allowed to visit the sick-room too often. She's too tender-hearted."

"But Mashi, how do you prevent her from coming?"

"Because she obeys me so implicitly. But still I have constantly to be giving her news of you."

The stars glistened in the sky like tears. Jotin bowed his head in gratitude to his life that was about to depart, and when Death extended his right hand towards him through the darkness, he took it in perfect trust.

Jotin sighed, and, with a slight gesture of impatience, said:

"Mashi! If Mani is still awake, then, could I—if only for a—?"

"Very well! I'll go and call her."

"I won't keep her long, only for five minutes. I have something particular to tell her."

Mashi sighing, went out to call Mani. Meanwhile Jotin's pulse began to beat fast. He knew too well that he had never been able to have an intimate talk with Mani. The two instruments were tuned differently and it was not easy to play them in unison. Again and again Jotin had felt pangs of jealousy on hearing Mani chattering and laughing merrily with her girl companions. Jotin blamed only himself,—why

couldn't he talk irrelevant trifles as they did? Not that he was unable to do so, for with his men friends he often had to chat on all sorts of trivialities. But the small talk that suits men is not suitable for women. You can hold a philosophical discourse in monologue, ignoring your inattentive audience altogether, but small talk requires the co-operation of at least two. The bagpipes can be played singly, but there must be a pair of cymbals. How often in the evenings had Jotin, when sitting on the open verandah with Mani, made some strained attempts at conversation, only to feel the thread snap. And the very silence of the evening felt ashamed. Jotin was certain that Mani longed to get away. He had even wished earnestly that a third person would come. For talking is easy with three, when it is hard for two.

He began to think what he should say when Mani came. But such manufactured talk would not satisfy him. Jotin felt afraid that this five minutes of to-night would be wasted. Yet, for him, there are but few moments left for intimate talk.

3.

"What's this child, you're not going anywhere, are you?"

"Of course, I'm going to Sitarampur."

"What do you mean Who is going to take you?"

"Anath."

"Not to-day my child, some other day."

"But the compartment has already been reserved."

"What does that matter? That loss can easily be borne. Go to-morrow, early morning."

"Mashi, I don't hold by your inauspicious days. What harm if I do go to-day?"

"Jotin wants to have a talk with you."

"All right! there's still some time. I'll just go and see him."

"But you mustn't say that you are going."

"Very well, I won't tell him, but I shan't be able to stay long. To-morrow is my sister's annaprashan and I simply must go to-day."

"Oh my child! I beg you to listen to me this once. Quiet your mind for a while and sit by him. Don't let him see your hurry."

"What can I do? The train won't wait

for me. Anath will be back in ten minutes. I can sit by him till then."

"No, that won't do. I shall never let you go to him in that frame of mind. Oh you wretch! the man you are torturing is soon to leave this world; but I warn you, you shall have to remember this day till the end of your days! That there is a God! there is a God! you will some day understand!"

"Mashi! You mustn't curse me like that."

"Oh, my darling boy! My darling! Why do you go on living longer? There is no end to this sin, yet I cannot check it!"

Mashi after delaying a little returned to the sick-room, hoping by that time Jotin would be asleep. But Jotin moved in his bed when she entered. Mashi exclaimed:

"Just look what she has done!"

"What's happened? Hasn't Mani come? Why have you been so long, Mashi?"

"I found her weeping bitterly because she had allowed the milk for your soup to get burnt! I tried to console her, saying, 'Why there's more milk to be had!' But that she could be so careless about the preparation of *your* soup made her wild. With great trouble I managed to pacify her and put her to bed. So I haven't brought her to-day. Let her sleep it off."

Though Jotin was pained when Mani didn't come, yet he felt a certain amount of relief. He had half feared that Mani's bodily presence would do violence to his heart's image of her. Such things had happened before in his life. And the gladness of the idea that Mani was miserable at burning *his* milk filled his heart to overflowing.

"Mashi!"

"What is it, Baba?"

"I feel quite certain that my days are drawing to a close. But I have no regrets. Don't grieve for me."

"No dear, I won't grieve. I don't believe that only life is good and not death."

"Mashi! I tell you truly that death seems sweet."

Jotin, gazing at the dark sky, felt that it was Mani herself who was coming to him in Death's guise. She has immortal youth and the stars are flowers of blessing showered upon her dark tresses by the hand of the World-Mother. It seemed as if once more he had his first sight of his bride under the

veil of darkness.* The immense night became filled with the loving gaze of Mani's dark eyes. Mani, the bride of this house, the wee little girl, became transformed into a world-image,—her throne on the altar of the stars at the confluence of life and death. Jotin said to himself with clasped hands, "At last the veil is raised, the covering is rent in this deep darkness. Ah! beautiful one, how often have you wrung my heart, but no longer shall you forsake me!"

4.

"I'm suffering Mashi, but nothing like you imagine. It seems to me as if my pain were gradually separating itself from my life. Like a laden boat it was so long being towed behind, but the rope has snapped and now it floats away with all my burdens. Still I can see it, but it is no longer mine, But, Mashi, I've not seen Mani even once for the last two days!"

"Jotin, let me give you another pillow."

"It almost seems to me, Mashi, that Mani also has left me like that laden boat of sorrow which drifts away."

"Just sip some pomegranate juice, dear! Your throat must be getting dry."

"I wrote my will yesterday; did I show it to you? I can't recollect."

"There's no need to show it me, Jotin."

"When mother died, I had nothing of my own. You fed me and brought me up. Therefore I was saying—"

"Nonsense child! I had only this house and a little property. You earned the rest."

"But this house——?"

"That's nothing. Why you've added to it so much that it's difficult to find out where my house was!"

"I'm sure Mani's love for you is really—"

"Yes, yes! I know that Jotin. Now you try to sleep."

"Though I have bequeathed all my property to Mani, it is practically yours, Mashi. She will never disobey you."

"Why are you worrying so much about that, dear?"

"All I have, I owe to you. When you see my will, don't think for a moment that—"

"What do you mean Jotin? Do you think I shall mind for a moment because

* The bride and the bridegroom see each other's face for the first time at the marriage ceremony under a veil thrown over their heads

you give to Mani what belongs to you? Surely I'm not so mean as that?"

"But you also will have——."

"Look here Jotin, I shall get angry with you. You want to console me with money!"

"Oh Mashi! How I wish I could give you something better than money!"

"I hat you have done, Jotin!—more than enough. Haven't I had you to fill my lonely house? I must have acquired that great good fortune in many previous births! You have given me so much that now, if my destiny's due is exhausted, I shall not complain. Yes, yes! Give away everything in Mani's name—your house, your money, your carriage and your land—such burdens are too heavy for me!"

"Of course I know you have lost your taste for the enjoyments of life, but Mani is so young, that—"

"No! you mustn't say that. If you want to leave her your property, it is all right, but as for enjoyment—"

"What harm if she does enjoy herself, Mashi?"

"No, no, it will be impossible. Her throat will become parched and it will be dust and ashes to her."

Jotin remained silent. He could not decide whether it was true or not, and whether it was a matter of regret or otherwise, that the world would become distasteful to Mani for want of him. The stars seemed to whisper in his heart:

"Indeed it is true. We have been watching for thousands of years and know that all these great preparations for enjoyment are but vanity."

Jotin sighed and said: "We cannot leave behind us what is really worth giving."

"It's no trifle you are giving, dearest. I only pray she may have the power to know the value of what is given her."

"Give me a little more of that pomegranate juice. Mashi, I'm thirsty. Did Mani come to me yesterday, I wonder?"

"Yes she came, but you were asleep. She sat by your head, fanning you for a long time, and then went away to get your clothes washed."

"How wonderful! I believe I was dreaming that very moment that Mani was trying to enter my room. The door was slightly open and she was pushing against it, but it wouldn't open. But,

Mashi, you're going too far—you ought to let her see that I am dying, otherwise my death will be a terrible shock to her."

"Baba! Let me put this shawl over your feet, they are getting cold."

"No, Mashi! I can't bear anything over me like that."

"Do you know, Jotin, Mani made this shawl for you. When she ought to have been asleep, she was busy at it. It was finished only yesterday."

Jotin took the shawl and touched it tenderly with his hands. It seemed to him that the softness of the wool was Mani's own. Her loving thoughts have been woven night after night with its threads. It is not made merely of wool, but also of her touch. Therefore, when Mashi drew that shawl over his feet, it seemed as if, night after night, Mani had been caressing his tired limbs.

"But Mashi! I thought Mani didn't know how to knit,—at any rate she never liked it."

"It doesn't take long to learn a thing. Of course I had to teach her. Then it contains a good many mistakes."

"Let there be mistakes; we're not going to send it to the Paris Exhibition. It will keep my feet warm in spite of its mistakes."

Jotin's mind began to picture Mani at her task, blundering and struggling and yet patiently going on night after night. How sweetly pathetic it was! And again he went over the shawl with his caressing fingers.

"Mashi! Is the doctor downstairs?"

"Yes, he will stay here to-night."

"But tell him it's useless for him to give me a sleeping draught. It doesn't give me real rest and only adds to my pain. Let me remain properly awake. Do you know, Mashi, that my wedding took place on the night of the full moon in the month of Baisakh? To-morrow will be that day, and the stars of that very night will be shining in the sky. Mani perhaps has forgotten. I want to remind her of it to-day; just call her to me for a minute or two.... Why do you keep silent? I suppose the doctor has told you I am so weak that any excitement will—but I tell you truly, Mashi, to-night if I can have only a few minutes' talk with her there will be no need for any sleeping draughts. Mashi, don't cry like that! I am quite well, to-day my heart is full as it has never been in my life before. That's why I want to see Mani. No, no,

Mashi! I can't bear to see you crying! You have been so quiet all these last days, why are you so troubled to-night?"

"Oh Jotin, I thought that I had exhausted all my tears, but I find there are plenty left. I can't bear it any longer."

"Call Mani. I'll remind her of our wedding night so that to-morrow she may——"

"I'm going, dear. Shombhu will wait at the door. If you want anything, call him."

Mashi went to Mani's bedroom and sat down on the floor crying,—“Oh come, come once, you heartless wretch! Keep his last request who has given you his all! Don't kill him who is already dying!”

Jotin hearing the sound of footsteps started up, saying, “Mani!”

“I am Shombhu. Did you call me?”

“Ask your mistress to come?”

“Ask whom?”

“Your mistress.”

“She has not yet returned.”

“Returned? From where?”

“From Sitarampur.”

“When did she go?”

“Three days ago.”

For a moment Jotin felt numb all over and his head began to swim. He slipped down from the pillows, on which he was reclining, and kicked off the woollen shawl that was over his feet.

When Mashi came back after a long time, Jotin didn't mention Mani's name and Mashi thought he had forgotten all about her.

Suddenly Jotin cried out, “Mashi, did I tell you about the dream I had the other night?”

“Which dream?”

“That in which Mani was pushing the door and the door wouldn't open more than an inch. She stood outside unable to enter. Now I know that Mani has to stand outside my door till the last.”

Mashi kept silent. She realised that the heaven she had been building for Jotin out of falsehood had toppled down at last. When sorrow comes, it is best to acknowledge it.—When God strikes, it is no use trying to dodge the blow.

“Mashi! The love I have got from you

will last through all my births. I have filled this life with it to carry it with me. In the next birth, I am sure you will be born as my daughter, and I shall tend you with all my love.”

“What are you saying, Jotin? Do you mean to say I shall be born again as a woman? Why can't you pray that I should come to your arms as a son?”

“No, no, not a son! You will come to my house in that wonderful beauty which you had when you were young. I can even imagine how I shall dress you.”

“Don't talk so much, Jotin, but try to sleep.”

“I shall name you ‘Lakshmi.’”

“But that is an old-fashioned name, Jotin!”

“Yes, but you are my old-fashioned Mashi. Come to my house again with those beautiful old-fashioned manners.”

“I can't wish that I should come and burden your home with the misfortune of a girl-child!”

“Mashi, you think me weak and are wanting to save me all trouble.”

“My child, I am a woman, so I have my weakness. Therefore I have tried all my life to save you from all sorts of trouble,—only to fail.”

“Mashi! I have not had time in this life to apply the lessons I have learnt. But they will keep for my next birth. I shall show then what a man is able to do. I have learnt how false it is to be always looking after oneself.”

“Whatever you may say, darling, you have never grasped anything for yourself, but given everything to others.”

“Mashi, I can brag of one thing at any rate. I have never been a tyrant in my happiness, or tried to enforce my claims by violence. Because lies could not content me, I have had to wait long. Perhaps truth will be kind to me at last.—Who is that Mashi, who is that?”

“Where? There's no one there, Jotin!”

“Mashi, just go and see in the other room. I thought I——”

“No, dear! I don't see anybody.”

“But it seemed quite clear to me that——”

“No, Jotin it's nothing. So keep quiet! The doctor is coming now.”

“Look here, you mustn't stay near the patient so much, you excite him. You go to bed and my assistant will remain with him.”

“No, Mashi! I can't let you go.”

"All right, Baba ! I will sit quietly in that corner."

"No, no ! you must sit by my side. I can't let go your hand, not till the very end. I have been made by your hand and only from your hand shall God take me."

"All right, you can remain there. But Jotin Babu, you must not talk to her. It's time for you to take that medicine."

"Time for my medicine ? Humbug ! The time for that is over. To give medicine now is merely to deceive ; besides I am not afraid to die. Mashi ! Death is busy with his physic, why do you add another nuisance in the shape of a doctor ? Send him away, send him away ! It is you alone I need now ! No one else, none whatever ! No more falsehood !"

"I protest, as a doctor, this excitement is doing you harm."

"Then go, doctor, don't excite me any more !—Mashi, has he gone?...That's good ! Now come and take my head in your lap."

"All right dear ! Now Baba, try to sleep !"

"No, Mashi ! Don't ask me to sleep. If I sleep, I shall never awake. I still need to keep awake a little longer. Don't you hear a sound ? Somebody is coming."

"Jotin, dear, just open your eyes a little. She has come. Look once and see !"

"Who has come ? A dream ?"

"Not a dream, darling, Mani has come with her father."

"Who are you ?"

"Can't you see ? This is your Mani !"

"Mani ? Has that door opened ?"

"Yes, Baba, it is wide open."

"No, Mashi ! Not that shawl ! Not *that* shawl ! That shawl is a fraud !"

"It is not a shawl, Jotin ! It is our Mani, who has flung herself on your feet. Put your hand on her head and bless her. Don't cry like that, Mani ! There will be time enough for that. Keep quiet now for a little."

SATNAMIS AND SIKHS : 17th CENTURY

SUCH open attacks on Hinduism by all the forces of Government as marked the reign of Aurangzib naturally produced great discontent among the persecuted sect. Some frantic attempts were made on the Emperor's life, but they were childish and ended in failure. The wandering Hindu saint Uddhav Bairagi was imprisoned in the police station "as a punishment for his seduction of men to falsehood." In June 1669, two of his Rajput disciples stabbed to death Qazi Abul Mukaram, by way of revenge. Aurangzib put to death not only the two murderers but also their innocent spiritual guide.—(M. A. 84.)

Early in 1669 a most formidable popular rising took place in the Mathura district. The Indian peasant, especially in Agra, Mathura and Oudh, was a bad tax-payer in Muslim times, and the collection of revenue often required the use of force. Akbar's wise regulations for giving fixity to the State demand and protecting

the ryots from illegal exactions had disappeared with him. Under his successors, no doubt, a revenue collector was removed from his post when his oppression became intolerable and the public outcry against him repeatedly reached the Emperor's ears. But such cases were exceptional. In the Mathura district in particular, nothing was done by Government to win the love and willing obedience of the peasantry, but rather a policy was followed which left behind it a legacy of undying hatred.

For instance, we read how a local faujdar named Murshid Quli Khan Turkman (who died 1638) took advantage of his campaigns against refractory tenants to gratify his lust. When the villagers were defeated he seized all their most beautiful women and placed them in his harem. Another practice of this licentious officer is thus described in the *Masir-ul-umara* (iii, 422).

"On the birthday of Krishna, a vast

gathering of Hindu men and women takes place at Govardhan on the Jamuna opposite Mathura. The Khan, painting his forehead and wearing a *dhoti* like a Hindu, used to walk up and down in the crowd. Whenever he saw a woman whose beauty filled even the Moon with envy, he snatched her away like a wolf pouncing upon a flock, and placing her in the boat which his men had kept ready on the bank, he sped to Agra. The Hindu [for shame] never divulged what had happened to his daughter."

Abdun Nabi Khan who was faujdar of Mathura from August 1660 to May 1669, was free from such vices. But he gave the people equally strong provocation in another way. He had started life as an officer of Sadullah Khan, the famous *wazir*. His able and honest management of his master's private estates greatly improved their income and prosperity. It attracted Shah Jahan's attention. One day he smilingly asked his *wazir*, "How is it that you have a Philosopher's stone but do not show it to me?" Sadullah understood his meaning and replied, "Yes, your Majesty, Abdun Nabi is a man in outward form, but he has the property of creating gold." Passing on to the imperial service, Abdun Nabi occupied trusted though subordinate positions and rose to the rank of a commander of Two Thousand before his death. He amassed property worth more than 30 lakhs of Rupees, besides building a grand mosque at his own expense.

Aurangzib chose him as faujdar of Mathura probably because he, being "a religious man" (as the Court history calls him), was expected to enter heartily into the Emperor's policy of "rooting out idolatry." Soon after joining this post Abdun Nabi built a Jama Masjid in the heart of the city of Mathura (1661-1662) on the ruins of a Hindu temple. Later, in 1666, he forcibly removed the carved stone railing presented by Dara Shukoh to Kesav Rai's temple. When in 1669 the Jat peasantry rose under the leadership of Gokla, the zamindar of Tilpat, Abdun Nabi * marched out to attack them in the village of Bashara, but was shot dead during the encounter (about 10th May).

* Abdun Nabi, *Ruqat* No. 34 ('Philosopher's stone'), A. N. 573, 966, M. A. 75, 83 (death) N. W. Gaz. viii. Pt. 1. 93, *Akhbarat*, 97. There is a village named after Abdun Nabi on the left bank of the Jamuna, opposite Mathura and south of Gokla.

Gokla, flushed with victory, looted the parganah of Sadabad, and the disorder spread to the Agra district.

At this Aurangzib sent a strong force under Radandaz Khan to quell the rebellion, while high officers like Saf Shikan Khan and Hassan Ali Khan were successively appointed faujdars of Mathura. Throughout the year 1669 lawlessness reigned in the district. An attempt in September to make terms with Gokla by granting him a pardon on condition of the restitution of all his booty, failed. By the end of November the situation had become so serious that the Emperor had to march from Delhi to the affected area. On the 4th December Hassan Ali Khan attacked the rebel villagers of Rewarah, Chandar-kaha, and Sarkhud. They fought till noon, when being unable to resist any longer, many of them slaughtered their women and rushed upon the swords of the Mughals, fighting with the recklessness of despair. The loss of the imperialists was heavy, while the rebels had 300 killed and 250 (both men and women) taken captive. During the campaign the Emperor very humanely detached 200 horsemen to guard the crops of the villagers and prevent the soldiers from oppressing any of them or taking any child prisoner.*

Next month Hassan Ali Khan with his lieutenant Shaikh Razi-uddin of Bhagalpur (who was a rare combination of soldier, theologian, traveller and business man in one) defeated Gokla. The rebels, who mustered 20,000 strong, mostly Jats and other stalwart peasants, encountered the imperial forces at a place 20 miles from Tilpat, and charged most gallantly. But after a very long and bloody contest they gave way before the superior discipline and artillery of the Mughals, and fled to Tilpat, which was besieged for three days and at last stormed at the point of the sword. The havoc was terrible. On the victors' side 4,000 men fell and on the rebels' 5000, while 7000 persons, including Gokla and his family, were taken prisoner. The Jat leader's limbs were hacked off one by one on the platform of the police office of Agra, his family was forcibly converted to Islam, and his followers were kept in prison in charge of the provost of the Imperial camp.

* Peasant risings in Mathura and Agra districts—M. A. 83, 92-94, 110; Ishwardas, 53 (fall of Gokla); *Akhbarat*, 112, 113, 114.

Innocent strangers who had been arrested along with the rebels, were ordered to be set free after proper inquiries, while the old men and children were handed over to an eunuch of the Court.

But the trouble did not die out with the loss of one leader. We read that even as late as March of that year (1670), Hassan Ali Khan was "engaged in slaying and capturing the rebels, plundering their houses, extirpating their families, and dismantling their strong [mud] forts." These measures had the desired effect, and in a short time peace was restored to the district.

But the peace did not last more than ten years. In June 1681, the faujdar of the environs of Agra had to lead an expedition against some villagers and was mortally wounded by them. This was a purely agrarian revolt, and was probably soon ended. In 1688, when the Emperor was engaged with his many enemies in the Deccan, the second great Jat rising began, under the leadership of Rajah Ram, and though Rajah Ram was soon slain, his brother Churaman Jat with his headquarters at Sansani, carried on an intermittent war till the end of Aurangzib's life, and could not be subdued by that Emperor's decadent successors.

The revolt of the Satnami faqirs in May 1672 has gained a place in the history of Aurangzib out of all proportion to its size or political importance. Unlike other popular disturbances of the reign it appealed to the vulgar craze for the supernatural and sent a short thrill of fear to the capital itself. Hence, men greatly marvelled at it and it became the talk of the age.*

The *Satnamis* are a Hindu sect so called from their devotion to the name of the true God (*Satya nam*). The people nicknamed them *Mundivas* or Shavelings from their practice of shaving off all the hair,—even the eye-brows, from their heads. The sect is scattered all over Upper India, and has monasteries in many places, but its stronghold in that century was the district of Narnol, 75 miles south-west of Delhi. The religious mysteries practised by these

sectaries were abominable, and a contemporary Hindu historian, Ishwardas Nagar, thus describes the repulsion which they excited: "The Satnamis are extremely filthy and wicked. In their rules they make no distinction between Hindus and Musalmans, and eat pigs and other unclean animals. If a dog is served up before them, they do not show any disgust at it! In sin and immorality they see no blame." (61b.)

But evidently their esoteric doctrines and rites did not make them bad citizens or men. Khafi Khan (ii. 252) gives them a good character as an honest and manly brotherhood, saying, "Though they dress like faqirs, most of them follow agriculture or trade on a small capital. Following the path of their own faith they wish to live with a good name and never attempt to obtain money by any dishonest or unlawful means. If any one tries to oppress them, they cannot endure it. Most of them carry arms."

These people came into conflict with the forces of Government from a purely temporal cause. "One day a Satnamic cultivator near Narnol had a hot dispute with a foot soldier (*piada*) who was watching a field, and the soldier broke his head with his thick stick. A party of Satnamis beat the assailant till he seemed dead. The *shiqqadar* (petty revenue collector), hearing of it, sent a body of *piadas* to arrest the men; but the Satnamis assembled in force, beat the *piadas*, wounded some of them, and snatched away their arms. Their number and tumult increased every hour."

The quarrel soon took on a religious colour and assumed the form of a war for the liberation of the Hindus by an attack on Aurangzib himself. An old prophetess appeared among them and declared that her spells could raise an invisible army at night, that the Satnamis fighting under her banner would be invulnerable to the enemy's weapons, and that if one of them fell eighty others would spring up in his place. The movement spread like wild fire and the Government was completely taken by surprise. The rising looked like a sudden "irruption of ants out of the ground or of locusts from the sky." Soon some five thousand Satnamis were up in arms. The local officers underrated the danger and sent out troops in small parties who were successively defeated. These initial victories only raised the confidence of

* Satnamis.—M. A. 115, K. K. ii. 252—254, Ishwardas 61b; *Storia*, ii. 167—168. Akshay K. Datta's *Bharat barshiya Upasaka Sampradaya*, i. 260—270, and Wilson's *Religious Sects of the Hindus*, evidently describe another sect bearing the same name but founded about 1775.

the rebels and confirmed the tale of their magical power. They plundered many villages in the district and when, at last, the faujdar of Narnol came out to meet them, they routed him with heavy loss and seized the town.

The danger now assumed threatening proportions. The victorious rebels plundered Narnol, demolished its mosques, and established their own administration in the district, holding it by means of outposts and collecting the revenue from the peasants. "The zamindars of the neighbourhood and some foolish Rajputs seized the opportunity to rebel and withhold the payment of revenue to the state. The disturbance daily grew worse." "The rebels marched to Bairat Singhana, looting the villages. The noise of their tumult reached Delhi, where grain became scanty and the citizens were greatly alarmed and distracted." Superstitious terror demoralised the imperial army. "Magical powers were ascribed to the Satnamies.... Great Rajahs and experienced generals with large armies were appointed against them, but refused to face them, though they had arrived within 32 or 34 miles of Delhi."

Aurangzib was now fully roused. On 15th March he sent a large force, 10,000 strong, under Radandaz Khan and many other high officers with artillery and a detachment from the Emperor's bodyguard against the rebels. To counteract the spells of the Satnamis, the Emperor, who had the reputation of a living saint (*Alamgir zinda pir*), wrote out prayers and magical figures with his own hand and ordered the papers to be sewed on to the banners of his army and displayed before the enemy. The encounter was terrible. "The rebels advanced to the attack. In spite of their poverty in materials of war, they enacted the scenes of the great war of the *Mahabharat*. The Muslim heroes reddened their pitiless swords in the blood of the wretches." After a most obstinate battle, two thousand of the Satnamis fell on the field, while many more were slain during the pursuit. "Very few of them escaped; and the tract of country was cleared of the infidels." In the imperial ranks 200 were killed, and Rajah Bishnu Singh Kachhwah, who had fought most gallantly, had his elephant wounded in seven places. The victors were richly rewarded. Radandaz Khan was given the title of Shujaet Khan, and all the officers, high and low alike, received promo-

tion and robes of honour. The artillery planted outside Delhi to command the approaches to the city stood there for some time after as an eloquent memorial of the panic created by the Satnami advance at the capital.

Towards the close of the 15th century, when the first wave of Muslim immigration into India had worn itself out, leaving the country in political disruption, social disorder and moral decadence, there arose in the extreme east and the extreme west of India two Hindu reformers who called upon the people to prefer the essence to the form of religion, a living faith to a dead mechanical ritual, and the spirit to the letter of their scriptures. Both of them insisted on the unity of the Godhead underlying the multitude of the idols of popular worship. Both taught that God can be realised only by means of a love as ardent and exclusive as the conjugal passion. Both urged on their hearers to work out their salvation personally by strenuous holy living and not to imagine that it can be won through any other man's exertions or the mechanical repetition of any other man's words. Both invited earnest believers to their folds without distinction of caste or creed, and tried to form a brotherhood of the elect. Both attempts, after glorious success for three generations, ended in failure, and their only result has been to add two more names to the long list of the religious sects of the Hindus. The goal of Chaitanya* was lost when his church passed under the control of Brahman Goswanis who developed a very subtle and esoteric theology in which the brain has suppressed the heart, and his Vaishnava followers now form two sharply divided sections,—an emotional but morally undisciplined rabble at the base, and a keenly intellectual but cold and fastidious priesthood at the top, without any link between them. The aims of Nanak were abandoned when his successors in the leadership of the Sikhs set up a temporal dominion for themselves and made military drill take the place of moral self-reform and spiritual growth.

"The liberation which Baba Nanak realised in his heart" was not political liberty, but spiritual freedom. Nanak had called upon his disciples to free themselves from selfishness, from narrow bigotry, from spiritual lethargy. Guru Gobind organised the Sikhs to suit a special purpose. He called in the human energy

* For the teachings of Chaitanya, see my work *Chaitanya's Pilgrimages and Teachings*.

of the Sikhs from all other sides and made it flow in one particular channel only; they ceased to be full, free men. He converted the spiritual unity of the Sikhs into a means of worldly success; he dwarfed the unity of a religious sect into an instrument of political advancement. Hence, the Sikhs who had been advancing for centuries to be true *men*, now suddenly stopped short and became mere *soldiers*! The end of Sikh history looks very sad. When a river, which had left the pure, snowy, cloud-kissing hill-tops to reach the ocean, disappears in a sandy plain, losing its motion, losing its song, a sorry sight is its failure. Even so, when the pure white stream of energy which issued from a *bhakta's* heart to cleanse and fertilise the earth ends in the red mire of a military cantonment, men can see no glory, no joy in it.....Today there is no spirit of progress among the Sikhs. They have crystallised into a small sect. Centuries have failed to produce new spiritual teacher from among them.*

Nanak, a Hindu of the small trader caste (Khatris), was born in 1469 at Talwandi, a place 35 miles S. W. of Lahor. In early youth he began to consort with holy men and wandering friars and have ecstatic visions, and then throwing up his post under Daulat Khan Lodi he took to a life of religious travel and preaching. The essence of his creed was belief in the one true living God, and the shaping of every man's conduct in such a way as to realise that God. In his moments of inspiration he held communion with his Maker and sang of Him in the very language of the Song of Songs. Like Kabir and other Indian saints before him, he preached against the hollowness of conventional beliefs and mechanical rites, and urged his hearers to go back to the very spring head of a personal and living faith. It was only natural that such a teacher should denounce the Hindus and Muhammadans of the age as false to their creeds and that his insistence on the common truth of all religions should make all spiritual-minded men among both sects accept him as their master and guide, even as Kabir had been accepted. But the vulgar people and the selfish priests raised the cry that Nanak had condemned their Scriptures as inefficacious for salvation, that he was saying "There is no Hindu and there is no Musalman," and even that he had "become a Turk!"†

Indeed, there was much in Nanak's speech and conduct to lend colour to such a charge. His dress was as eclectic as his doctrines.

"The Guru set out towards the east, having arrayed himself in a strange motley of Hindu and Muhammadan religious habiliments.....He wore a necklace of bones, and imprinted a saffron mark on his forehead in the style of Hindus." (Mac. i. 58.)

His devotion to one God, "the True, the Immortal, the Self-existent, the Pure, the Invisible," made him reject incarnations and idols as abominations, while his insistence on right conduct cut away the basis of ritualistic practices and set prayers. As he said, repeating the words of Kabir, "O brethren, the Veds and the Quran are false, and free not the mind from anxiety...God can be obtained by humility and prayer, self-restraint, searching of the heart, and fixed gaze on Him." (Mac. i. 177).

Nanak (who lived till 1538) drew round himself a band of earnest worshippers, and in time they solidified into a sect. But his original intention was to save all souls without distinction, and not to found a narrow brotherhood with its peculiar dress, marks, doctrines, form of worship and scripture. He acknowledged no *guru* save God and no worship except the practice of virtue. Even his hymns were mostly adapted from the sacred songs left behind by the monotheistic reformers of the past, and had nothing distinctive, nothing sectarian about them.

This liberality of mind, devotion to the essence of religion, and contempt for wealth and power continued to mark the Sikh gurus throughout the 16th century, from Nanak to Arjun the 5th guru. Their saintly lives won the reverence of the Mughal Emperors and they had no quarrel either with Islam or the State.

Before the reign of Aurangzib the Sikhs were never persecuted on *religious* grounds, and their collision with the Mughal Government, which began in Jahangir's time, was due entirely to *secular* causes, and the change in the character of the gurus was solely responsible for it.

Nanak had no guru save God, and his two immediate successors were chosen for superior character only. But after the

are our original sources of information about the Sikh gurus. I shall in future refer to the first of these works as 'Mac.'

3rd guru the headship of the Church became hereditary. The guru was credited with superhuman powers; he was invested with royal pomp, and man-worship began to infect the Sikhs. When boys of nine and even five years (lik^e Govind Rai and Har Kishan respectively) were accepted as spiritual leaders, it was clear that the Guru had ceased to be regarded as a human teacher and was held to be born with supernatural powers like an incarnation of God, whose acts could not be judged by the standard of human reason.*

Under Arjun, the 5th Guru (1581—1606) the number of Sikh converts greatly increased and with them the guru's income. As a contemporary remarked, "The Emperor [Akbar] and kings bow before him. Wealth ever cometh to him." (Mac. iii. 28) "The royal state and retinue" of this guru were so great that even a Chancellor (*diwan*) of the empire considered the guru's son a desirable match for his daughter, but the guru scornfully declined the alliance. With the business instincts of a Khatri (petty trader), Guru Arjun organized a permanent source of income. A band of agents called *masands* were stationed in every city from Kabul to Dacca where there was a Sikh, to collect the tithes and offerings of the faithful; and this spiritual tribute, so far as it escaped peculation by the agents, reached the central treasury at Amritsar. The guru was treated as a temporal king and girt round by a body of courtiers and ministers called *masands*, which is the Hindi corruption of the title *masnad-i-ala* borne by nobles under the Pathan sultans of Delhi. Like the Muslim kings, too, the gurus took several wives.†

The effects of this conversion of a spiritual guide into an earthly ruler began to show themselves clearly after the death of Arjun. That guru was a lover of peace and humility, and devoted himself to consolidating the Church. He completed the two sacred tanks at Amritsar, built the first temple for enshrining the Holy Book

(*Granth*) on the site of the present Golden Temple, drew up a scheme of daily religious services for the Sikhs, and gave the final shape to their Scriptures by compiling a volume of hymns selected from those composed by his four predecessors as well as those current among "the followers of the principal Indian saints, Hindu and Muhammadan, since the days of Jaidev." (Mac. iii. 60.)

At the very end of his career, Arjun made the sole mistake of his life. Moved by compassion and entreaty, he in a weak moment blessed the banners of Khasrau, the rival of Jahangir for the Mughal throne, and even gave money help to that prince. On the defeat of the pretender, Jahangir fined the guru two lakhs of Rupees for his disloyalty to the king *de jure*. The Sikhs were willing to subscribe the amount; but the man of God forbade them, saying "Whatever money I have, is for the poor, the friendless and the stranger." (iii. 92.) He regarded the fine as an unjust imposition, refused to pay it, and stoically endured imprisonment and torture, which were the usual punishments of revenue defaulters in those days. Worn out by being forced to sit in the burning sand¹ of Lahor, he died in June 1606. This was clearly not a case of religious persecution, but merely the customary punishment of a political offender.

With his son Har Govind (1606-1645), a new era began. He was a man of a less spiritual fibre than Arjun. "Unlike his father, Har Govind constantly trained himself in martial exercises and systematically turned his attention to the chase." Early in his pontificate, he began to enlist men and increase his bodyguard of 52 warriors till it became a small army. When the saintly old Sikh, Bhai Budha, remonstrated against this unspiritual passion, Har Govind replied, "I wear two swords as emblems of spiritual and temporal authority. In the Guru's house religion *and worldly enjoyment* shall be combined." His retinue during his tours to places of pilgrimage was large enough to scare away holy men by suggesting that some Rajah had arrived! (Mac. iv. 4-5, 53.)

● Under the easy and good-natured Jahangir, Har Govind was fairly well treated by the imperial family, though he had to undergo twelve years' confinement in Gwalior fort to make him pay the balance of his father's fine. But the

* So, too, Babu Atal, the son of Hara Gobind, though only 8 years old, conveyed "a profound meaning in whatever he said even jestingly" (Mac. IV, 130) and was believed to be "a treasury of miraculous power." (131.)

† Har Rai, 7th guru, when a mere boy of nine was "wedded collectively" to all the daughters of a follower named Daya Ram. (Mac. iii. 225.)

growing military strength and royal pomp of the guru and his worldly spirit and tastes made a conflict between him and the government of the country inevitable, and it broke out after Shah Jahan's accession. When that emperor was hawking near Amritsar, the guru entered the same area in pursuit of game, and his Sikhs quarrelled with the servants of the imperial hunt about a bird. The two parties came to blows, and in the end the imperialists were beaten off with slaughter. An army was sent against the audacious rebel, but it was routed with heavy loss, at Sangrana, near Amritsar, 1628. (Mac. iv. 80-98.)

The victor's fame spread far and wide. "Many men came to enlist under the guru's banner. They said that no one else had power to contend with the Emperor."* Such an open defiance of imperial authority could not be tolerated near Lahor. Larger and larger armies were sent against the guru, and though he gained some successes at first, his house and property at Amritsar were, in the end, seized, and he was forced to take refuge at Kiratpur in the Kashmir hills beyond the reach of Mughal arms.†

Here he died in 1645, after investing his younger grandson, Har Rai, a boy of fourteen, as his successor. An elder grandson, named Dhir Mal, set up as guru in the Panjab plains, in alliance with the imperial government, and kept possession of the original copy of the *Granth*, which had already attained to the veneration of a tutelary idol.

Har Rai's pontificate (1645-1661) was uneventful. But Dara Shukoh had paid him visits of respect in the course of his general devotion to *sadhus*, and the guru had blessed the Prince when a fugitive in the Punjab after the battle of Samugarh. Aurangzib summoned Har Rai to answer for his conduct. The guru sent his eldest son Ram Rai to Court, but that young man temporised and ingratiated himself with the Mughal, for which his father disinherited him. Har Rai died in 1661 after

investing his second son, Har Kishan, as his successor. Ram Rai immediately proclaimed himself guru and claimed his father's heritage. Taking advantage of the disputed succession to the leadership of the Church, "the masands collected and kept the greater part of the offerings for themselves." (Mac. iv. 314-317).

Aurangzib summoned Har Kishan to Delhi to decide the suit. But before it could be done, the boy guru died of small-pox (1664), and the same scene of disorder and rapacity again broke out among the Sikhs. "Twenty-two [men] of Bakala claimed the right to succeed him. These self-made gurus forcibly took the offerings of the Sikhs." (iv. 332). After a time Tegh Bahadur, the youngest son of Har Govind, succeeded in being recognised as guru by most of the Sikhs. With his personal followers he accompanied Rajah Ram Singh (the son of Mirza Rajah Jai Singh) to the Assam War (1668) and fought in the Mughal ranks; but he came back to Upper India in a few years, and took up his residence at Anandpur.

From this place he was drawn into the whirlwind which Aurangzib had raised by his policy of religious persecution. A soldier and priest could not remain indifferent while his creed was being wantonly attacked and its holy places desecrated.* He encouraged the resistance of the Hindus of Kashmir to forcible conversion and openly defied the Emperor. Taken to Delhi, he was cast into prison and called upon to embrace Islam, and on his refusal was tortured for five days and then beheaded on a warrant from the Emperor.

Now at last open war broke out between the Sikhs and Islam. The murdered guru's followers were furious; one of them threw bricks at the Emperor (27th Oct. 1676) when he was alighting from his boat on his return from the Jama Masjid. (M.A. 154). But such attempts at retaliation were futile. Soon a leader appeared among the Sikhs who organised the sect into the most efficient and implacable enemy of the Mughal Empire and the Muslim faith. Govind Rai, the tenth and last guru (1676-1708) and the only son

* He had so completely sunk the character of a religious reformer in that of a conquering general, that he had no scruple in enlisting large bands of Afghan mercenaries. These afterwards deserted him, joining the imperial general, and attacked the guru.

† *Dabistan*, 188. The Sikh accounts disguise the guru's defeat, but they can offer no explanation of his flight to the hills if he had been, as they allege, always victorious over the imperialists.

* Khafi Khan (ii. 652) says, "Aurangzib ordered the temples of the Sikhs to be destroyed and the guru's agents (*masands*) for collecting the tithes and presents of the faithful to be expelled from the cities." Life of Tegh Bahadur in Mac. iv. 331-387. The Persian histories are silent about him.

of Tegh Bahadur, was a man of whom it had been prophesied before his birth that "he would convert jackals into tigers and sparrows into hawks." He was not the person to leave his father's death unavenged. All his thoughts were directed to turning the Sikhs into soldiers, to the exclusion of every other aim.

We have by this time travelled very far indeed from Baba Nanak's ideal,* and we may here pause to consider what causes made the success of Guru Govind possible. The first was the gradual elevation of the guru to a superhuman position. Nanak, like every other Hindu religious preacher, had laid stress on the help which a true teacher (*guru*) can give in leading a man to the path of virtue; the guidance of one experienced in such things saves the disciple much difficulty, chance of error, and loss of time. "The object of the guruship is to save the world, to give instruction in the true Name, and to blend men with their Creator" (iv. 316). Such being the guru's function, he was to be implicitly obeyed. As Bhai Gurudas, who lived in the late 16th century, says in his exposition of the essence of the Sikh religion :

"The Sikh who receiveth the guru's instruction is really a Sikh. To become a disciple is, as it were, to become dead. A disciple must be like a purchased slave, fit to be yoked to any work which may serve his guru. Love none but the guru; all other love is false." (Mac. IV. 244-263.)

A natural consequence of such teaching was the blind unquestioning devotion of the Sikhs to their spiritual head. The author of *Dabistan*, who had frequent friendly intercourse with Har Govind, narrates a story (p. 193) how a certain guru praised a parrot and a Sikh immediately went to its owner and offered to barter his wife and daughter for the bird ! In other words, he had no hesitation in dooming his wife and daughter to a life of infamy simply to gratify a passing fancy of his guru. The perversion of moral judgment and ignorance of the relative value of things illustrated by this anecdote and another† that I have omitted for the

sake of decency, are extreme; but so too is the spirit of devotion among the followers of the gurus.

This implicit faith in a common superior knit the Sikhs together like the soldiers of a regiment. As Har Govind told his disciples, "Deem the Sikh who comes to you with the guru's name on his lips as your guru." (iv. 219.) The Sikhs were famous in the 17th century for their sense of brotherhood and love for each other.* This was quite natural, as the Sikhs felt themselves to be a chosen people, the Lord's elect. We again quote the language of Bhai Gurudas : "Truth is hidden both from the Hindus and the Muhammadans ; both sects have gone astray. But when they lay aside superstition they form one body of Sikhs. . . . Where there are two Sikhs, there is a company of saints ; where there are five Sikhs, there is God !" (iv. 272 and 243.) The unity due to sameness of religion was further cemented by the abolition of caste distinctions under orders of Govind. All restrictions about food and drink, so prevalent in Hindu society, had already been discarded, and to be a Sikh was to be "as free in matters of eating and drinking as a Musalman." (iv. 219.)

Everything was, therefore, ready for converting the sect into a military body obedient to its chief to the death, and what is even more difficult, ever ready to surrender the individual conscience to that of the guru. If Cromwell's Ironsides could have been inspired with the Jesuits' unquestioning acceptance of their Superior's decisions on moral and spiritual questions, the result would have equalled Guru Govind's Sikhs as a fighting machine.

Govind steadily drilled his followers, gave them a distinctive dress and a new oath of baptism, and began a policy of open hostility to Islam. He harangued the Hindus to rise against Muslim persecution, and imposed a fine of Rs 125 on his followers for saluting any Muhammadan saint's tomb. His aims were frankly material. "Mother dear, I have been considering how I may confer empire on the Khalsa." And, again, "I shall make men of all four castes lions and destroy the Mughals." (Mac. v. 109 and 99.)

* As Har Rai once said, "The vessel which Baba Nanak had constructed for the salvation of the world, had almost foundered." (Mac, V. 151.)

† *Dabistan*, 192. It shows that the Sikhs of the middle 17th century held the same views about women as the Anabaptists of Munster did. Macauliffe considers this author's testimony about the guru as "of the highest importance" (iv. 217.)

* Sujan Rai of Batala wrote in 1695, "The reliance which this sect has on its leader is seldom seen in other sects. If a wayfarer arrives at midnight and takes the name of Baba Nanak, he is treated as a brother." (*India of Aur.*, 91.) Mac. V. 90-92.

Clearly Nanak's ideal of the kingdom of heaven to be won by holy living and holy dying, by humility and prayer, self-restraint and meditation,—had been entirely abandoned. Guru Govind lived in princely state, kept a train of poets in his court, and made plenty of gold ornaments for himself and his family. His bodyguards were provided with arrows tipped with gold to the value of Rs 16 each; and he had a big war drum made in imitation of the Mughal imperial band, while his troops insulted and robbed the subjects of his host, the Bilaspur hill-Rajah, like the liveried retainers of the barons of mediæval England. (v. 59,111,5,137.)

In the hills of north Panjab, Govind passed most of his life, constantly fighting with the hill-Rajahs from Jammu to Srinagar in Garhwal, who were disgusted with his follower's violence and scared by his own ambition,—or with the Mughal officers and independent local Muslim chiefs who raided the hills in quest of tribute and plunder. Large imperial forces were sent from Sarhind to co-operate with the quotas of the hill-Rajahs and suppress the guru; but they were usually worsted. He was once defeated and expelled from Anandpur, but recovered the town on the retreat of the imperialists. His army went on increasing, as recruits from the Panjab *doabs* flocked to him and received baptism. Even Muslims were enlisted. Anandpur was five times invested. In the last attack, after undergoing great hardship and loss, with his followers and family threatening to desert if he prolonged the resistance, the guru evacuated the fort, and then went to Kiratpur, Nirmoh and Rupar, closely pursued by the Mughals. At Chamkaur with only 40 Sikhs he stood a siege in a Jat cultivator's house; but two of his sons were slain and he fled. Next he passed through many adventures and hair breadth escapes, changing his place of shelter repeatedly like a hunted animal. His two remaining sons were arrested by the governor of Sarhind and put to death (1705). The Mughal officers plundered parties of Sikhs going to make offerings to their Guru. (Mac. V. 121-222.) Then Govind with his small but faithful guards undertook a journey to Southern India by way of Bikanir and Baghaur; but returned to Northern India on hearing of Aurangzib's death (1707). He is said to have assisted Bahadur Shah I. in securing the throne,

and that Emperor made much of him at Agra and induced him to accompany him on the march to Rajputana and the Deccan. The guru reached Nander on the Godavari, 150 miles N. W. of Haidarabad in August 1707 at the head of some infantry and 2 to 3 hundred cavalry, and there after a stay of more than a year he was stabbed to death by an Afghan (1708.) With him the line of gurus ended. (v. 226-246).

The guru was gone, but not the Sikh people. In the hour of his final defeat at Chamkaur, Govind's parting instructions had been to make the Sikhs independent of a supreme guide and to turn them into a military democracy. "He seated near him the five Sikhs who alone remained of the army, and proceeded to entrust the guru-ship to them. He said, 'I shall ever be among five Sikhs. Wherever there are five Sikhs of mine assembled, they shall be priests of all priests.' "

Even in the darkest days of Guru Govind's life, bands of his followers, each acting under an independent leader, used to harass the Mughal officers and raid parts of the Panjab. Of one such band the fate is thus described in a letter of Aurangzib (written about 1701-1705): "I learn from the news-letter of Shah Alam's camp sent by Khwajah Mubarak that nearly 20,000 Hindus, who call themselves the Khalsa of Govind the follower of Nanak, had assembled and gone to the country of the Barakzai under the escort of the Yusufzai Afghans, and that the men of the escort and other Afghans of the neighbourhood of the Nilab river had fallen on them, so that the party had been killed or drowned. The Emperor orders that the Prince should imprison these misbelievers, and expel them from that district." *

Thus we see that the Mughal government under Aurangzib did succeed in breaking up the guru's power. It robbed the Sikhs of a common leader and a rallying centre. Thereafter the Sikhs continued to disturb public peace, but only in isolated bands. They were no longer an army fighting under one chief, with a definite political aim, but merely moving bodies of brigands,—extremely brave, enthusiastic, and hardy, but essentially plunderers uninspired by any ambition to build up an

* Inayatullah's, *Ahkām 2a*. Readers of Kipling will remember the story of "The Lost Legion" in this connection.

organised government in the land. If Aurangzib had been followed by worthy successors, these Sikh bands would have been hunted down as surely as the Mirzas and Champat Bundela had been in the past, and Dhundhia Waug and Tantia Topi were to be under British rule.

If Ranjit Singh had not risen, there would have been no large and united State under Sikh dominion, but a number of

petty principalities in the Panjab with a ruling aristocracy of Sikh soldiers; and these would have been silently absorbed in the expanding British empire. The Persian and not the Sikh gave the death-blow to the Mughal empire, and it was not from the heirs of Aurangzib but from the Afghan inheritors of Nadir Shah that the Sikhs conquered the Panjab.

JADUNATH SARKAR.

REPORT ON INDENTURED LABOUR IN FIJI

BY C. F. ANDREWS AND W. W. PEARSON.

[All rights reserved]

THE facts which have hitherto been stated, for the most part in general terms, may be illustrated and made more clear to the reader in India by the following specific cases. They are a few out of a very large number of instances which have come under our special notice.

1. A respectable woman, who told us that she had been on a pilgrimage to Benares and had become confused in the strange crowd and separated from her relations. A man had seen her crying and had promised to bring her to her own people. He had taken her instead to the Depot. When she had found out her true plight, she had been too frightened to resist. Asked why she had answered the Magistrate's questions, she said that she was too frightened to do anything else. Asked whether she was told that she was to go on board ship and settle across the sea, she said 'No'.

Very many circumstantial narratives of this kind were told us. It was noticeable to us how very large a proportion of the women, whom we questioned, were recruited at the pilgrim centres.

2. A well educated, delicate lad from a village near Delhi, who spoke English fluently. He had been promised clerk's work by the recruiting agent. He was told nothing about being obliged to live in the coolie 'lines'. When we met him he was very unhappy. He had saved a little

money and wished to buy himself out, but was not allowed at the time to do so. His employer had been kind to him and put him on light work, but nothing could remove the depression he felt at being forced to live as a coolie in the coolie 'lines'.

3. A Kayastha, who was met at Allahabad by a man wearing a sacred thread. The man pretended to be a Brahman, and promised the Kayastha work as a Teacher in a school at Puri. He was taken instead to the Calcutta Depot. This man was now out of indenture, and he was doing all he could in Fiji to help those who were still in the coolie 'lines'. He gave us a great deal of help, and we found his information accurate on the whole. Though educated in his own vernacular and quite above the 'coolie' class in average intelligence, he was very deaf and at times appeared almost stupid. He was thus one who could have been easily deceived in the first instance. He told us, that he had actually found out his mistake, when in the Depot, but he had been too fearful to run away. From all we saw of him, we were convinced that his own narrative was substantially true.

4. A low caste Hindu, who was brought out under indenture for 'agricultural work' and was set to cut up meat in a butchery. When asked by us how he, a Hindu, could engage in such work, he replied that he could not help it, as he was ordered to do

it. He seemed much ashamed of himself, and hung down his head while he answered our questions. His companions in the butchery were Musalmans.

5. A Kabir-Panthi, now out of indenture, who had been originally obliged to do the same kind of work. He told us that he had continually refused and had been imprisoned. We looked up his record on the estate and found he had been given 692 days' imprisonment while under indenture. When he came to see us, he had clearly lost his moral character, and his record in the Colony, since he had become a free Indian, was a bad one. He had even been charged with biting a man's nose in a sordid quarrel and had been found guilty. But, in spite of this, we found a simple and true side to his character. It was not altogether undermined. It is not unlikely that he became a moral wreck through being compelled to do a work which was against his instincts and his conscience.

[We found some Madrasis of low caste who actually preferred to do this kind of butcher's work. But it is quite clear that the Government of India never contemplated such an occupation as butchery under the head of 'agriculture' in the agreement. We therefore gave our own personal opinion to the Fiji authorities, that Hindus, however low in caste, should not be set to do the work of slaughtering animals.]

6. A Brahman boy, aged about 15, who came out in 1915. He had been deceived by the recruiting agent as to the nature of the work which he would be required to do. He was told when in India that he would have garden work given him in Fiji. His hands were quite unhardened, and he was very miserable, and seemed to be quite a child still in every way. He begged very pitiably to be allowed to go home to India.

[We found many cases of mere boys being indentured in India and brought out to Fiji. In one case a child came to us, who was under indenture. He declared that he was only twelve when he was recruited. He had been out nearly a year, and from his appearance we should regard it as doubtful, if he could have been more than fourteen when we saw him. It is surely open to question, whether a boy of such tender age can legally enter into a complicated agreement which binds him for five years and in most cases settles his whole future. When we looked at

random into the books of the Immigration Department, we found the following recent cases,

51500. Akkaru—Ganges I—1913.—aged 15.

51954. Thalary Nagadu—Ganges I—1913.—aged 16.

56149. Kuda Baksh—Mutlah I—1915.—aged 17.

56296. Baclia—Mutlah I—1915.—aged 17.

It should be noted that some of these ages are probably given on the higher side. We found, for instance, a boy who could hardly be more than 15 entered in Fiji as aged 17. When we had the Calcutta register examined, we found that he was entered there as 20 years of age. The Fiji official told us that he had seen how impossible the age of 20 was for a mere boy, and had put down the age of 17 in the Fiji register as nearer the mark.

7. An intelligent coolie, labouring in the Mill, told us that he was obliged to work on twelve hour shifts, and on alternate weeks had to go on night work from 6 p. m. to 6 a. m. without extra pay. There is no mention of night work in the agreement. We found out, still further, that a large amount of highly skilled labour was being performed by the indentured coolies at an absurdly low rate of pay. Among the coolies who had been thus engaged in looking after the machinery of the Mills were some who had been discarded because of some accident. In one Mill, three men came up to us who had each lost a limb and were crippled for life. Yet no compensation had been made to them for this life-long injury. We only heard of one case in the whole Colony, where such compensation had been given by an employer for serious injury to a coolie; and in that case the compensation was extracted by Government pressure. Thus the mill-owners so used their labour under the cover of the indenture system, that they obtained skilled work from the more intelligent of the coolies at a rate of a quarter the market value, and, when these coolies met with an accident in the performance of their duty, refused to pay any compensation whatever except under pressure.

8. A Madrasi; came out in 1913 on Sutlej IV aged 18. Laughed as he narrated to us how he had been deceived by the recruiting agent. Described to us his

appearance before the Magistrate in India and how he hurried through the performance of question and answer. His parents did not know anything about where he had gone, till he wrote from Fiji; because he thought he was only going to get employment a short way from home and then to return.

[A very large number of coolies told us that their relations knew nothing of their whereabouts. Some told us they had never sent any letter home out of shame. Others told us that there was great difficulty in getting letters written and posted. Many again informed us that they had never heard from home though they had written again and again. This was not unlikely; because when we went into a central post office in the interior of the main island and mentioned a coolie's name (whose widow-mother had written to us on our arrival in Fiji asking for news of her son), we found that a letter from the mother, properly addressed, had been waiting for three months undelivered. The postal arrangements are very bad in the Colony outside Suva, the Capital. There must be an incalculable amount of misery amongst the relatives left behind in India, owing to the bad postal arrangements in Fiji and to the evils of fraudulent recruiting in India itself.]

9. A respectable married man who came out with his wife and two children finding the struggle for existence very hard in India and hoping to get on better in Fiji. But he found by experience that living was so expensive in the Colony, that it was even more difficult than in India to keep his family and himself supplied with proper food and clothing. When his wife was nursing her child (she was the only woman with children in the coolie 'lines') they were nearly starving. The average cost of food alone for one person in Fiji is not less than 3 rupees per week, and at that time he was earning 4 rupees 2 annas per week. This man was very anxious to return home to Fyzabad in the United Provinces, where he had been earning six annas a day. He told us that he could manage to keep his wife and children better there than in Fiji.

[Even in this war time, with higher prices for every commodity in Fiji, there has been no substantive advance made in coolies' wages. Some employers have done a little to help out the earnings of the

indentured coolies by issuing tickets which can purchase rice and sharps at pre-war rates. We were told by one employer that purchase by means of such "tickets" saved the coolie six annas in every three rupees. But the "ticket" process is very cumbrous; and very few coolies took advantage of it. When we asked the general manager of the C. S. R. Co., why the company did not give the coolie an advance in actual wages, he replied that when wages once rise, they have a tendency to keep up and not come down again. The company, therefore, had devised the "ticket" system. It was obvious to us, from this, that as far as wages are concerned the indenture system places the coolie completely at the mercy of his employers.]

10. Two young Telugus were interviewed by us in the coolie 'lines'. They came out in 1915. What attracted them was the promise of twelve annas a day. They were earning four annas a day in India. They told us that they were no better off in their cost of living in Fiji. In hours of work, their condition was far worse than in India. In Madras their days' work was always over by noon; in Fiji they had to go on up to five or six o'clock in order to complete their task. In Fiji they were very unhappy because no one in the coolie 'lines' could speak their own language, and they often could not understand the manager's or the sardar's orders. They were very anxious to get back to India.

The hours of labour mentioned were borne out by what we saw elsewhere. Late one evening a boy came over to the house where we were staying, about 3 miles away from some coolie 'lines,' which we had visited about 5.30 p. m. that same afternoon. When we asked him next morning why we did not see him in the 'lines' he said that he had been out in the field when we came, because he had not completed his task. We were away when he came to see us that evening but the Missionary with whom we were staying told us that he arrived in a very exhausted condition. It was one of those cases of boy labour which troubled us so much in Fiji. The Planter was in every way a good man, but this case had escaped his notice. We asked for the boy to be put on three quarter task with full pay and this was done.

11. A Madrasi of very low caste and low features came to us for protection against a sardar who had locked him up

(so he told us) and beaten and starved him. The Inspector, to whom we brought the case, was inclined to disbelieve the coolie, because he had already obtained convictions against two sardars quite recently in the same coolie 'lines' for doing the same thing. We suggested that a bad tradition having been once established in the coolie 'lines' it would be difficult to get rid of it. At our express wish, therefore, the Inspector took up the case; and it resulted in the man's story being found true. One sardar was convicted in the Magistrate's court, another Sardar was acquitted on a technical point of law, but an appeal to the Supreme Court has been lodged by the Inspector. The English overseer through whose neglect the cruelties were allowed to go on has been dismissed, owing to the firm action of the Agent General of Immigration. The case was a striking testimony to us of the genuine desire on the part of the Government authorities to obtain justice for the 'coolie'. At the same time it also revealed to us the extraordinary difficulty under which coolies labour whose mother-tongue is not Hindustani. It was, literally, a matter of hours before we could get from this coolie the plain facts of his story; and the feeling that he was not understood made him nervous and excited, and this gave us a false impression. The Inspector was in the same difficulty as ourselves.

[The recent immigration of Madrasi coolies, who speak Telugu Tamil Malayalam and Canarese, has led to the greatest possible confusion. In a trial for murder before the Chief Justice, held while we were in Suva, the accused prisoner only knew Malayalam. The Court Interpreter only knew Tamil and English. A third party, therefore, had to be called in who knew Malayalam. The Chief Justice was, in this way, twice removed by language barriers from the prisoner at the bar. Yet, in these faulty circumstances, he was obliged to try the Madrasi for his life, and actually to condemn him to death.]

12. A Hindustani girl of good caste and respectable Hindu parentage had been decoyed from her father's home by a neighbouring woman in her village. The pretext was that a telegram had been received from her husband, who was ill and wanted her to go to him at once. Her father, not being on good terms with her husband's father, had separated her from her husband.

She went, therefore, with this woman without letting her father know. Too late she found out how she had been deceived. On board ship her honour was assailed and only with the greatest possible difficulty had she been able to retain it. Now her only hope is that her father and mother will think that she is dead, because she feels that she has brought disgrace to her family. Though she has been nearly two years in Fiji she has not yet recovered from her first despair. She is afraid even to let her parents know where she is, because of the sense of degradation at her present lot in life.

13. A Rajput who came out on the distinct understanding that he would be able to join a regiment if he went to Fiji. He spoke under great excitement when we saw him, as he was in prison and condemned to death. His words were not easy to follow at one point, but we gathered that when signing, a Sahib had assured him that this would be his lot. He said with great emphasis that a Sahib could not tell a lie. He and his brother had been soldiers in India in Rajputana. They were a military family. Then his brother inherited some land and left his regiment and became a Zamindar. He joined his brother for a time, but was hankering to get back to his old military life when the recruiting agent came and deceived him. When he arrived in Fiji, he was told that he would have to enter the coolie 'lines' and serve with the sweepers—as he expressed it. In such compulsory degradation, as he thought it, his life went utterly to pieces. He told us that the insults he received in the coolie 'lines' had been unbearable. "They pulled my moustache" he said, and suited the action to the word. His offence had been an act of murder in a quarrel with a Muhammadan over an abandoned woman. The woman had slapped the Rajput's face and he had stabbed her. In spite of his crime, there was a great nobility in his bearing when we saw him. He only broke down, when one of us asked him if he would like his parents to be visited and told about him; or if he would wish to send them any message. We were both more deeply affected by his whole story, and by the fortitude with which he spoke to us, than it is possible to express in words. He was condemned to be hanged, but owing to the clemency of the Governor the sentence was commuted

to penal servitude. We were very anxious about this Rajput's fate, when we left the Islands. The Governor had not yet consulted his Executive Council. But he was good enough to cable to us, on his own initiative, when our ship reached New Zealand, the news of the reprieve.

In connexion with this case an extract may be given from a petition very fully signed by Indians in Fiji and endorsed by many Europeans.

Respectfully sheweth

That under the existing system of Indian labour immigration there is a great disproportion between the number of males and females.

That this disproportion is mostly responsible for the abnormal number of murders and kindred crimes among Indians.

That the majority of those found guilty of such crimes are otherwise quiet and law-abiding; and the murders, for which they are condemned to death, are not due to any murderous instinct in them, but really to sexual jealousy.

That the proportion of crimes relative to the same class of people in India is, by far, much lower than in this Colony.

That in the Colony of Mauritius, for over five years past, there has not been a single trial of murder by Indians, who, as a mass, belong to the same class as those in Fiji.

That the death sentence does not, as a matter of fact, seem to deter Indians from crime in this Colony, since the whole cause of the trouble here is sexual jealousy.....

This petition was very favourably reported in the Fiji newspapers, and leading Europeans in the Islands very warmly took up the matter of abolishing the death sentence in these murder cases. Many Planters informed us that it was invariably the finest and best Indian coolies who committed these murders, never the worst. This was, to us, very striking news: its significance will be seen, when the criminal statistics are examined later on in the Report.

14. A Muhammadan Munshi, a cultured man and very intelligent. He had been brought out under the promise that he would be given work in a *madrasa*. He had been appointed Sardar in the coolie 'lines' and shewed us his notes which he had kept. He told us that the custom was general of a commission being paid to the Sardar by each coolie. Otherwise the Sardar was able to bring petty tyranny to bear on the coolie who did not pay. A much worse information, which he gave, was that the Sardar arranged according to payment, the location of women with certain favoured men. We had further accounts of this at other centres,

and from what we saw with our own eyes, within the 'lines', concerning the relation of the Sardar to the coolies, it seemed to us not improbable. This Munshi had married by Muhammadan rites a wife, while still living in the coolie lines. But this wife would not, in the ordinary course of events, be set free, until two years after his own indenture had expired. We did our best to get her 'commuted,' as the situation appeared to us highly dangerous, and the Munshi was a very respectable man.

15. A Panjabi, who was a thorough gentleman in his general bearing. He had served for a considerable time in a Panjabi Regiment. He had been quartered at Delhi and gave us the names of his English officers and spoke of his Colonel with great warmth and affection. He had been brought out under the promise of regimental service abroad. The effect of military discipline in the past was noticeable. He had kept his respectability and neatness and good manners in the midst of the coolie 'lines.' He did not complain to us, but took it as his fate.

16. A young Madrasa who kept his good character. He spoke a little English and was fairly educated. This young lad was compelled by the Law of Indenture to live in the midst of grossly immoral surroundings for five years. There was a missionary near to these coolie 'lines' who wished to buy him out and employ him as a Catechist and Teacher. While we were there he was able to do so, and the boy is now free. He told us he had been recruited under entirely false information concerning the life to which he was coming out.

17. A young highly educated Indian, who could write and speak English well. He was soon recognised as unfit for agriculture, and was given important clerical work under Government. He was, however, kept strictly under indenture, and paid a lower salary than he would be entitled to, as a free Indian. Recently he applied for a rise in salary and asked also to be allowed to commute his indenture: for he had been able to save up enough money for that purpose. The increase of salary was refused. He was further warned that, unless he gave satisfaction to Government, not only would his request for commutation be disallowed, but he might be sent back to the plantations under the Law of Indenture.

The fact that a responsible and well-disposed Government, whose actions were on the whole kindly and considerate (as this Report will show) could offer such a threat to a highly educated man, struck us very much indeed. It seemed to bear out our contention, that a five years' indenture with penal clauses attached is a bondage.

These examples may be sufficient to illustrate the fact that recruiting, as at present carried on in India, is frequently unscrupulous and that the indenture itself is neither a free nor an intelligent contract. So strongly did the fact about fraudulent recruiting come home to us that we felt the necessity to cable direct without delay to India, urging that such harmful practices should be stopped. We thought that this could only be accomplished by strong Indian public opinion expressing itself in vigorous action.

We were often asked, in Fiji, to explain how it was possible for the Indian coolies to pass through the examination of the Magistrate and Doctor and Emigration Agent in India, without ever coming fully to understand, what the exact conditions of labour in Fiji were. We have already pointed out the misleading character of the Government agreement itself; how it does not represent the true facts of life in Fiji. It is not unlikely that the Doctor and Magistrate in India are more ignorant of the whole truth than those who drew up that agreement. But, beyond this, it is also probable, that, in many cases, their official work is perfunctorily undertaken. How, otherwise should we find a mere child (who could hardly have been more than 14 or 15) registered as 20 years of age? How could educated high-caste boys, whose very hands would show that they were unused to hard field labour, be sent out to work at the sugar cane? We cannot avoid this inference from the actual cases that have been brought to our notice in Fiji. A conclusion still more serious, was this, that, in addition to collusion with the Police, there was collusion with the subordinate officials of the larger central Depots, in order to keep the hesitating coolies in a state of fear right up to the end. The stories about these subordinate officials, and their treatment of the coolies in the Depot, were too circumstantial to leave much doubt in our own minds about the matter. Free Indians who had no reason for telling us anything but the

truth, were equally clear on this point with those who were still under indenture. Even if the evidence of this corrupt practice were not conclusive, yet it made us feel strongly the imperative need of opening the Depots much more freely than at present to the Indian public. We would also urge that, if recruiting still continues, a reference should be made to the village and family of each person, who is taken into the Depot, and that no one, under the age of twenty, should be recruited except as a member of a family.

There have been lamentable and tragic cases of Indians, both men and women, who have thrown themselves into the Hughli, in order to escape from the emigrant ships, and also of actual suicides, occurring in the high seas. It is difficult to give details of these, because 'deaths' are not separated from 'suicides' and 'desertions' on the ships' records. But we heard the account of one voyage in the year 1912 from an eye witness, who could be trusted. He stated to us that one Coolie had jumped overboard into the Hughli, and one woman had committed suicide at sea. We find in the Indian Immigration Report 1912, in a paragraph referring to the voyage of Ganges 1, the record that "Two male immigrants from Madras, missing at different dates, were supposed to have been lost overboard." This may possibly be the voyage referred to, though the statements do not exactly tally.

We found out, in Fiji, another side of the coolie's difficulties, when he is first brought to the Depot as a recruit. There is nearly always present among this class of Indian villagers (who rarely, if ever, in their lives come face to face with Englishmen) a very potent and peculiar fear of the Sahib. "Why did you not ask the Sahib to release you?" Was the question, which we very often used to put to individual coolies, who had told us about some pitiable fraud of the recruiting agent, practised upon them. The answer invariably came "On account of fear." In one case, a woman told us, how the recruiting agent had terrified her about the magistrate assuring her, that if she did not answer the magistrate's questions in a certain way, which he specified, the Sahib would put her into prison. We have discovered that a great fear comes over the coolies in the strange surroundings of the Depot, and they look

with dread on the functions and powers of the Sahib. Their one bewildered, dominant idea seems to be, that they should try to please the Sahib at all costs. Sadly enough they have little idea when they answer, in the way the recruiting agent has instructed them, the Sahib's questions, that they are throwing away their last chance of release.

One further important point needs to be mentioned in order to make the picture complete. Besides the growth, when in the Depot, of all this fear, suspicion and alarm, there is also a sense of hopelessness, like that of an animal who has been caught in a trap and has given up the useless struggle to escape. Again and again, the indentured coolies explained to us this feeling, and there was a ring of truth about their utterance. It was their 'fate'; so they spoke of it to us; and, in that one word 'fate' all the despair and misery of the situation seemed to be summed up. Those among them, who were respectable women, had the overwhelming dread upon them, that they would never again be taken back into their homes. Indeed, the recruiting agent appeared to know only too well, that when once he had kept such a woman absent from her husband, even for a single night, the rest of his work would be comparatively easy. The woman would feel instinctively that her fate was sealed, and give up any further efforts to get free.

We found one strangely inaccurate idea current among the Planters in Fiji, namely, that a large proportion of those who have already been out once under indenture, return a second time. This erroneous statement was presented to us again and again as the basis of an argument. It was said that it would be quite impossible for the coolies in the various depots to remain unaware of the conditions of indentured labour in Fiji, (even though these were not stated clearly in the agreement) because so many were continually returning under indenture; and such a class of men would not be likely to resist the temptation of telling all they knew to the others. Also, a second argument was used with us, that the indenture system could not be so black as we painted it, because, in that case so many coolies would not be likely to return under a new indenture.

I. will be well to examine these argu-

ments in the light of facts. The figures are available for the years, 1912, 1913 and 1914.

In 1912, there were 3402 Indian immigrants landed in Fiji, of whom 5 men, 5 women and 4 children had previously served or resided, in Fiji, *i.e.*, 10 adults out of a total of 3402.

In 1913, there were 3289 Indian immigrants who landed in Fiji, of whom 8 men, 2 women and 5 children had previously served, or resided, in Fiji, *i.e.*, 10 adults out of a total of 3289.

In 1914, there were 1572 Indian immigrants who landed in Fiji, of whom 19 men, 9 women and 4 children had previously served or resided, in Fiji, *i.e.*, 28 adults out of a total of 1572.

Taking the year 1912, as a test of the worth of the first argument (*viz.*, that all the coolies in the various depots would be told the exact labour conditions in Fiji by returning immigrants) it will be seen how very unlikely it would be that five men (some of whom might have decided to go back at the last moment before the ship sailed) could have communicated detailed information about indentured labour in Fiji to 3402 persons scattered over the depots of North India and Madras Presidency.

Considering the second argument, namely, that the conditions of indentured labour are so popular with those who have once experienced it, that large numbers go out a second time, the figures seem to prove the very opposite. For although the Indian coolies find by bitter experience, that they are outcaste and homeless on their return to India, they scarcely ever decide to go back again to Fiji. In the three years for which statistics are available only 32 men out of 8261 immigrants made up their minds to return under indenture.

We met one such, a Natal coolie, who had come out as an indentured immigrant to Fiji. He told us that he had first gone back from Natal to his home in Madras, but had been outcasted. He wished to marry, and to settle down in his village, but no one would receive him or marry him because he had broken caste. He spent what little money he had brought back from Natal in trying to get back into caste, but all in vain. When all his money was spent, he came across a recruiting agent

from Fiji, and in despair decided to go out again under indenture.

In the light of such an undoubtedly true narrative as this, it will be seen how little truth there is in the assumption, that all those, who come back to Fiji under indenture, do so because they are satisfied with the indenture system. This Natal coolie did not sign on again because he liked indentured labour, but because he had given up hope of being ever received back into his community in India. Among the almost infinitesimal proportion who do actually re-indenture in India, there must be some at least who have had that Natal coolie's experience.

As we have already stated, therefore, the facts, when examined, go against the very arguments which they are used to support. They tell the other way. And the assumptions are fallacious.

As, in a measure, a confirmation of this conclusion, that the indenture system is almost universally disliked by the coolies themselves, one of us, while talking with the overseer of a large estate in Fiji mentioned the word 'commutation', suggesting that this should be always permitted (i. e., that coolies should be allowed to commute their time of service by payment of a sum of money). The overseer said significantly "Why! The coolies in these lines would all commute tomorrow, if only they had the chance!"

There were many evidences in Fiji to show, that recruiting in North India had become more and more unscrupulous in recent years. The number of mere lads that were now being sent out was significant. Women, also, had apparently been more difficult than ever to obtain, and the number of women of abandoned character seemed to be on the increase. It was noticeable, also, that the proportion of Madrasis had grown in comparison with Hindustanis. The reason of this has been clearly the rise of wages in North India. While the minimum wage of the indentured coolie in Fiji has remained stationary for thirty-two years, the wages of unskilled labour in the north of India have gone up, sometimes as much as 200 per cent. It is becoming more and more unlikely that the Indian peasant will go, of his own accord, thousands of miles across the sea, to obtain a wage distinctly less, in actual value, than that which he can get near at hand in his own motherland.

Why, for instance, should an able-bodied villager, from Gurgaon or Rohtak, go out across the seas to Fiji, in order to get a mere four rupees per week in wages, when he could get more money by levelling the soil at New Delhi, with wheat selling there at less than half the Fiji price. Clearly the fraud and lying must be very deep indeed, which can induce people to go out to Fiji, at a time when labour is so needed and wages are so high. Yet we found coolies who had been taken from the Delhi district. Their story was that they had been deceived by false prospects. Almost the same figures and rates might be quoted for the price of hired labour in Behar. Yet we found men and women in Fiji who had been recently recruited from districts such as these. In each case which we enquired into, gross deception appeared to have been practised. The coolies complained, that they had not at all understood the kind of work which would be required of them, nor the price of food and clothing in Fiji, nor the penal clauses of indenture.

In South India there seems to be less evidence of fraudulent recruiting than in the North. Wages are much lower, and recruiters' work may be easier on that account. But it must be remembered also that we could only converse easily with those Madrasis who had picked up a little knowledge of Hindustani; and we had practically no opportunity of hearing from the lips of Madras women their own account of how they were recruited. It should be added, that the introduction of Madrasis into Fiji has been accompanied by a distinct rise in the rates of suicide and violent crime. This has led to the opinion, now widely held among the Planters in Fiji, that Madrasis are more prone to suicide and crimes of emotional violence than Hindustanis. We pointed out again and again, that this was not in accordance with the facts; because the suicide rate in the Madras Presidency was actually lower than that of the United Provinces and Behar. But the whole question of the suicide rate must be left over for the present. It will come up later in dealing with the proportion of the sexes.

Perhaps the most disconcerting effect of unscrupulous recruiting, in Fiji, is the distrust of Government which it has engendered among the indentured and free Indians alike. Government is regarded as

having countenanced the deception of the recruiter and, in consequence, State officials are both feared and suspected. It is painful to find that the authorities are not looked upon by the Indians as their friends. Even the Agent General of Immigration, whose duty it is to protect the interests of indentured Indians, is not exempt from this distrust. This is all the more discouraging, because the Agent himself, and his staff have every desire to do the Indians justice. Perhaps the most significant fact of all is, that the Indians who are on the staff, although full of sympathy towards their fellow countrymen, are regarded with something of the same distrust. They felt keenly the difficulty of this suspicious attitude, and spoke to us about it.

This distrust of Government has evidently started from the coolie 'lines.' But it has not by any means stopped there. It has continued to spread among the free Indians, even though there may be little occasion for it. The distrust is kept out of sight, or covered by outward complaisance, because the free Indian cannot get rid of his servile tradition quickly, and is suspicious and afraid. The servile feeling engendered in the coolie 'lines' remains deep down in the heart, and it is a menace to successful administration.

To illustrate this point,—we found invariably that whenever we went out with the Immigration officers, we could never get from the coolies any frank and open statements. It is impossible to describe in words their suspicious attitude—their sullen looks their muttered whisperings. And then, on the other hand, we could see their changed faces, when they were positively certain, at last, that we had nothing to do with Government at all.

One of us had occasion to visit a free settlement of free Indians, who were living on their own land. The visit was made in company with an immigration officer, who had shown his sympathy with these same Indians on more than one occasion. Yet the whole visit was a failure, simply because of his presence. The free Indians remained silent and uncommunicative. Very early next morning, however, they sent a deputation, privately, to ask for another visit—only the Government official should not be present. In that case they promised to talk freely.

Not only in the country areas, but also in Suva, the Capital, this suspicion lies

very deep. It has already done untold injury to the contentment of the colony, and it will do far more unless it is speedily arrested.

The more carefully the whole question of recruitment is considered, the more clear it becomes, that to send out people of the coolie class from India as individuals, instead of in families, is wrong in principle. For they have never been accustomed to live as individuals. They have been used to the communal life. Women in India are all married at a very early age, and they are bound up with their families and their homes. Men also, in India, are usually married early and their life is bound up with their community. To recruit a man here and a woman there, and to send them out to Fiji, away from all their communal and family ties, is certain to lead to misery in India and also to immorality in Fiji. We found pitiable cases of men, who had been living with one woman after another in Fiji, while their own truly married wives and their legitimate children were deserted in India. We found equally pitiable cases of Hindu and Muhammadan wives reduced to leading a life of shame, while their true husbands were still living in India. These cases were all the more pitiable because the poor, ignorant coolies had apparently ceased to feel the moral degradation of it all.

The conclusion we reached on the whole subject was that men and women from India should either be recruited by families or not at all.

We obtained in Fiji a considerable body of evidence with regard to conditions of life on board the large emigrant vessels, which carry the indentured coolies. After discounting a great deal, as probably due to exaggeration, the strong impression was still left in our minds, that little care is taken of the privacy of the women, and of the manner of cooking the emigrants' food. We ourselves saw something of these conditions on our way to and from South Africa, and we could understand what the coolies in Fiji told us. Many said that they had been obliged during the voyage out to give up their old Hindu habit of taking only vegetable food. Some who regarded it as a sin to take animal food, went through tortures of fear; for even if meat were not actually present in the food, they were afraid that animal fat might have been used while cooking it. The

strict Hindu suffered accordingly. We were told in Fiji that a very large percentage of Hindus began to abandon their vegetarian habits from the time of the voyage out. It was a strange sight for us to see a butcher's shop in Suva, where beef as well as mutton was being sold, crowded with Hindus waiting eagerly to obtain their purchases of meat.

Even more serious, on board ship, as far as we could gather on enquiry, was the little care taken of the modesty of Indian women. Abandoned women were mixed up in the same quarters with those who were respectable. Temptation to evil was ever present. We had facts given to us on this point which were the plain records of eyewitnesses themselves, and not likely to be untrue.

Lastly, the number of deaths on board, among those who had quite recently been twice passed by the Doctor as medically sound, tells its own story. We were informed by trustworthy people in Fiji, who had themselves made the voyage out as free Indians, that the vice and misery on board the emigrant vessels were deplorable. The following are the statistics for the years 1912 to 1914 with regard to the deaths on the voyage out and in the Depot on arrival.

Out of 3,428 emigrants embarked in 1912, 27 "deaths, desertions or missing" occurred on the voyage; 22 deaths (20 of which were children) occurred in the Depot at Suva, and 9 unallotted immigrants died in the Colonial Hospital; a total of 58, or one immigrant in 60.

Out of 3,307 immigrants embarked in 1913, 21 "deaths, desertions or missing" occurred on the voyage. Eleven deaths (six of which were children) occurred in the Depot at Suva, and 15 unallotted immigrants died in the Colonial Hospital; a total of 47, or one in 70.

Out of 1,572 immigrants embarked in 1914, six "deaths, desertions or missing" occurred on the voyage. Three deaths (all children) occurred in the Depot, and two unallotted immigrants, died in the Colonial Hospital; a total of 11, or one in 143.

One of the persistent features, which has marked the indentured system from the beginning, has been the low proportion of adult women to adult men. There have been financial reasons to account for this. For although the cost of the voyage out is the same for woman as for a man, the

amount of work which a woman can do is much less than that of a man. Where therefore, cheap labour is the first concern, it is inevitable that the employer should aim at getting the largest possible number of men.

Thus the low proportion of indentured women is not something accidental, which can be abandoned without modifying the system. Rather, it is an integral factor in the system itself, which, apart from this paucity of women, could not be run at the high profits required by the employers. The moment that we suggested to the planters in Fiji such reforms as would help to make a decent family life possible among the coolies, we were met on all sides with the word 'impossible.' The expense, they declared, would be prohibitive.

The Indian Government has been blamed for allowing such a low proportion, as that of forty adult women to every hundred men to continue for so long unaltered. But it should be remembered to Government's credit, that it, and it alone, has prevented the proportion from falling much lower still. If the employers as a body, had their own way in the past there can be little doubt that they would have brought the rate down long ago to twenty-five per cent, or even less. Even today, the temptation is a pressing one, to pass out the emigrant ships with something slightly less than the regulation number of women.

This introduces another important consideration, which shows still more clearly how the whole Indian indenture system in its practical working hangs together. With the method invariably adopted hitherto of recruiting individuals, rather than whole families, it has been found exceedingly difficult to obtain in India even as many as forty women for each hundred men, without drawing largely on the prostitute class. Out on the plantations, we have been told, it is this very class which is actually needed in order to make the indenture system work. It is utterly repugnant to us to be obliged to enter into details on such a subject, and we shall do so as sparingly as possible. But it will easily be seen, that when the stronger men on an estate have taken to their own possession an equal number of women, the remainder of the adult women find themselves still more unequally

matched in number. The disproportion rises as high as one woman to four, or even to five, men. In these circumstances, the remark of one employer can be understood without comment.—When one of us spoke to him about recruiting no more abandoned women, he demurred and answered "Why! The system couldn't go on without them." We heard of one estate where the Overseer made the regular practice, in order to keep peace in the 'lines,' of allotting so many men to each single woman. This amounted to regulated prostitution.

We had both of us already witnessed in Natal the moral evils, in the coolie quarters, connected with this disproportion of men, to women. We had received, also, invaluable help from Mr. Gandhi, who was the first to make clear to us the far reaching effects of these evils upon the free Indians. But what we have now seen with our own eyes in Fiji, is far worse than anything we had ever seen before. The moral evil in Fiji appears to have gone much deeper.

We cannot forget our first sight of the coolie 'lines' in Fiji. The looks on the faces of the men and the women alike told one unmistakable tale of vice. The sight of young children in such surroundings was unbearable to us. And, again and again, as we went from one plantation to another, we saw the same unmistakable look. It told us of a moral disease which was eating into the heart and life of the people.

What else could be expected? Indian villagers, who have lived the communal life of their own Indian homes, are first taken away, one from here, and one from there, by the recruiting agents. They are completely separated from all their old ties and associations. Then they are crowded together on board the great emigrant ships, where decency can hardly be preserved, and every temptation is rife. Lastly in Fiji itself, they are crowded again into the coolie 'lines,' which are more like stables than human dwellings; and there they are forced by law to remain, away from every restraint of custom or

religion, during a period of five years. What else could be expected? But, that little children should be born and brought up in this,—

Though we were no novices to conditions such as these, yet what we met with in Fiji was far worse than we had ever anticipated. There seemed to be some new and undefinable factor added,—some strange unaccountable epidemic of vice. We felt that vice was spreading, like a blight, over the Indian population of Fiji. We began to fear that it would spread still further to the indigenous Fijian population; and we found that our fears were already shared by others.

The demand was made quite insistently by the Planters that we should explain to them the reason for the suicidal tendency among the indentured coolies in Fiji. The long, never-ending roll of these suicides had shocked the Government; and the Planters had felt it deeply also.

We were able to assure the Government on one point. As far as we could see, there was much less actual ill-treatment of indentured coolies than we had come across in Natal. The only reports that reached us, which approached the Natal plantations in this respect, were those that came from Navua.

Furthermore, we were both of us quite clear in our own minds, that the inspection of the plantations was much more carefully carried out by the Immigration Department in Fiji than in Natal.

Thirdly, much less racial feeling existed in Fiji than we had met in South Africa. There was more humanity towards the Indians. The race question did not come up with any great acuteness.

All these important things would have led us to expect, that the lot of Indians in Fiji would be happier, and therefore the temptation to commit suicide would be less marked. But as we have said, our actual experience led us to believe that the moral evil had gained a far stronger hold in the 'coolie' lines of Fiji than it had done in Natal. And, unfortunately, Government statistics only confirmed this impression.

(To be continued)

THE BADAGAS . A TRIBE OF THE NILGIRIS

BY. M. TURNER.

THOUGH they are not so well-known as the famous Toda tribe, the Badagas of the Nilgiris are an interesting hill tribe, whose customs and social habits are of no little interest, and well repay the lover of ethnology for the time spent in gathering information regarding them. During the hot season hundreds of visitors to Ootacamund and Coonoor wander over the surrounding hills, but a comparatively small number interest themselves in the villages and the people of this tribe which constitutes a great proportion of the hill population. The occasions of their festivals, marriage and death ceremonies are times when the most elaborate and suggestive ceremonies are conducted, accompanied by considerable pomp and enthusiasm. These people are easily recognisable and are commonly to be seen in the streets of the hill stations as well as at work in the fields.

"Both sexes of the Badagas may be recognised at a glance. They are cheery people, of small stature and slightly built, fair-skinned and dressed always in white cloths with coloured borders of narrow stripes. The men generally use the usual waist-cloth, upper cloth and turban, but coats are becoming more popular than upper cloths, and bright yellow or red woollen knitted night caps are almost as often worn as turbans. The women's waistcloths are narrow, and leave a good deal of the calves exposed, and their upper cloths (which are quite separate) are worn in characteristic fashion, being passed straight across the breasts and under the arms, and not over one shoulder as is usual with the Tamils. Some of them wear a scarf round the head. Every woman of marriageable age is tattooed on the forehead and the upper arms in some simple design of dots and lines, the elaborate patterns in the plains being unknown."

The name Badaga (corrupted to Burgher by the early European visitors to the hills) signifies a Northerner, and points to the fact that these people originally came from the Mysore country on the North, from which place they migrated centuries ago. The knowledge available does not permit of any definite date for the immigration being fixed, but it is probable the event took place somewhere in the twelfth century. It has been suggested that a critical study of the language,

which resembles Kanarese, might aid in tracing their arrival on the Nilgiris. Concerning the origin of the Badagas the following legend is current...Seven brothers and th

Note the drawings on the walls.

Hills. But on account of the improper conduct of a Muhammadan ruler toward one of the girls they were obliged to flee. They settled down in the present village of Betheladha. The brothers soon after separated and settled down in different parts of the Nilgiris where they steadily increased in numbers. The second brother, Hethappa, hearing of the ill-treatment of

Note the drawings.

several stones with an erect stone set thereon. There is further, a platform made of bricks and mud whereon the Badagas, when not working, sit at ease. In their folk-tales men seated thereon are made to give information concerning the approach of strangers to the village."

As to their ability as agriculturists, there is difference of opinion, some declaring it to be only casual, little effort being made to improve the yield of the soil. The work is chiefly done by women who spend long hours in the fields. A writer in the Pioneer in describing the pursuits of these people, says,

"Nobody can beat the Badagas at making mother earth produce to her utmost capacity, unless it be the Chinese gardener. Today we see a portion of the hill side, covered with rocks and boulders. The Badagas become possessed of this scene of chaos, and turn out into the place in hundreds, reducing it in a few weeks to neat order. The unwieldy boulders having been rolled aside serve their purpose by being turned into a wall to keep out the cattle. The soil is pounded and worried until it becomes amenable to reason, and next we see a green crop running in waves over the surface."

In connection with this means of livelihood it is not surprising that several ceremonies require to be performed to ensure success. The sowing and the har-

of which have a religious significance.

"The houses are not separate tenements, but a line of dwelling under one continuous roof, and divided by party walls. Sometimes there are two or three or more lines forming streets. Each house is partitioned off into an inner and outer apartment. If the family has cows or buffaloes yielding milk, a portion of the latter is converted into a milk-house, in which the milk is stored and into which no woman may enter. To some houses a loft made of bamboo posts, is added to serve a storehouse. In every Badaga village there is a raised platform composed of a single boulder or

A Badaga with 6 fingers on each hand and six toes on each foot.

bawls out, "Dho, Dho" thrice. He then rises, and scatters the grain on the soil thrice. The pujari and the Kurumba then return to the village, and the former deposits what remains of the grain in the storeroom. A new pot of water is placed in the milk house and the pujari dips his right hand therein, saying "Nerathubitta" (it is full). After this the sowing commences.

Their temples are most interesting structures, not because of elaborately architectural features, but by reason of

A Badaga Burning Ground.

vest time are both inaugurated by interesting ceremonies. The following is an account given by Thurston in his Ethnological series in a description of these people.

"On an auspicious day, a Tuesday before a crescent moon a pujari of the Devi Temple sets out several hours before dawn with five or seven kinds of grain in a basket, and sickle, accompanied by a Kurumba, and leading a pair of bullocks with a plough. On reaching the field selected, the pujari pours the grain into the cloth of the Kurumba, and yoking the animals to the plough, makes three furrows in the soil. The Kurumba, stopping the plough, kneels on the ground between the furrows, looking west. Removing his turban, he places it on the ground, and closing his ears with his palms,

the interesting drawings of animals, birds, etc., to be found on the walls. The two accompanying illustrations are good examples of the style of art to be found in these buildings, and some of them are very creditable representations. They are usually painted in glowing colours. On the occasion of the feasts the people assemble here, and after the performance of the required duties, engage in various games. The marriage customs are simple; they take place in the bridegroom's house, and consist chiefly of the bride going to fetch water, a sign that she has accepted the authority of her husband, and making

Entrance to Badaga Village.

salamms to the members of the bridegroom's family. These ceremonies are followed by the usual music, dancing, and feasts.

But of all their ceremonies the most complicated are those relating to funerals, a succinct account of which is given in the Nilgiri Gazetteer.

"When any one is sick unto death, and recovery is hopeless, he or she is given a small, gold coin—a Viraya farnam with four annas—to swallow. As soon as death ensues, a man of the Toreya subdivision is sent round to the neighbouring villages to announce the fact. On reaching any of them he removes his turban, and then tells his tidings.

"On the day of the funeral the corpse is carried on a cot to an open space, a buffalo is led thrice round it, and the hand of the dead is raised and placed on

the head of the animal. A funeral car is constructed, and on this is placed the body, dressed in its garments, covered with a new cloth, and with a couple of silver coins stuck on its forehead. The relations wail and lament round the body, salute it, and then dance round the car to the accompaniment of Kota music. The men wear special turbans and gaudy petticoats. The car is next taken to the burning ghat, stripped of its hangings, and hacked to pieces. The widow takes her last leave of her husband, depositing some of her jewels on the cot, and then an elder of the tribe stands at the head of the corpse and chants thrice a long litany, reciting all the sins the deceased might have committed, and declaring that all of them is transferred to a scape-calf which he names."

The tribe has not been considerably influenced by British ways, but they are losing some of the primitiveness generally associated with the Hill tribes

THE HINDU PUROHIT ACT

A Novel Piece of Religious Legislation in Baroda.

BY CHANDULAL MAGANLAL DOCTOR, B.A., LL.B., VAKIL, HIGH COURT, BARODA.

A NOVEL piece of religious legislation called the HINDU PUROHIT ACT was published on the 30th of December last in the Baroda State Gazette relating

to the performance of religious rites and ceremonies by Hindu Purohit or Priests in the Baroda State. It may be asked what justification is there to take up the

valuable pages of this Review in a matter which directly concerns only the Baroda State and its citizens? I hasten to explain that this is a matter which will interest the whole Hindu community of India, as it is a piece of legislation, the kind of which is yet almost unknown in this country. Besides, the Act may find its echo in some other Native State, as some of the former Acts of this State have actually found acceptance and been followed by some of them.

The Brahmin population of the State protested against the proposed Act and disputed the authority of the State to pass legislation in matters religious. It was replied that the King was called Dharmapala or "Protector of Religion," and he exercised sway in religious matters from the earliest times. He has, therefore, the authority of the Shastras. If we look to the West we find him in England the head of the Church. Another main objection against the Bill was that no non-Brahmin could be allowed to become a Purohit as the Bill permitted. But of this we shall speak later on.

The Hindu Purohit Bill was first discussed in our Legislative Council and was passed by a majority with certain amendments. The members of the Council while admitting the usefulness of such a law seemed somewhat afraid to injure the feelings of the Brahmin population of the State and tried, therefore, to shirk the responsibility of incurring their displeasure. They, therefore, struck upon a plan. A curious amendment was proposed by them and carried to effect that the Act should be in force at places where two-thirds of the population demanded its operation. This really amounts to a denial of their own representative character. For, if they grant the usefulness of the law they have also the authority derived from the people to accept the law. Our people are not so advanced as to demand any law. In fact it is absurd to expect farmers, labourers and potters and others of the type who form the greater part of the population to understand the aims and objects and the working of any law. I am sure if it were left to the people to have or not the Penal Code, they would never demand it.

To come to the subject proper. It is stated in the preamble that the law is enacted in order to grant certain rights

and letters of competence, or, shortly, licenses, to Purohits in order to equip them for the proper performance of the religious rites of the Hindus in this State according to proper ritual, legally and in a manner which may be felt satisfactory and conducive to their welfare by the people, and to enable them to understand and explain the inner import of such rites.

I shall now give the substance of the main provisions of the Act.

1. The Act shall apply to such localities or communities as may be determined by a notification hereafter.
2. (a) Purohit means any Gor (*i.e.*, priest) who in consideration of his customary due or charitable Dakshina officiates at any of the sixteen Sanskaras and other religious ceremonies or rites.
- (b) Vajamana-kritya means any ceremony at which a Purohit officiates.
3. (1) A period of six years is granted in order to become properly qualified under this Act for the performance of religious rites.
- (2) On the expiry of the aforesaid period no person not holding a letter of authority shall officiate at the performance of any religious rite.
- (3) No suit shall be allowed in a Civil Court brought by an unauthorised Purohit
- (a) for recovery of damages in respect of the violation of his right owing to a licensed Purohit officiating at a Vajamana-Kritya,
- (b) nor shall any suit or pleading by him be allowed in respect of any Vajamana-Hakka.
4. Any Purohit contravening sub-section (2) shall be liable to a fine upto Rs. 25.
5. Exceptions :—

Nothing in Sub-section (4) shall apply

- (a) To any person who has attained the age of 12 years at the date this Act comes into force, or
- (b) To a Purohit coming from outside the Baroda State and residing in this State for a short period not exceeding one month and officiating for a Vajamana also coming from outside the State, or
- (c) To a Purohit officiating at any Vajamana-Kritya, (though) not licensed, whether in the locality, or within a radius of three miles, or within any other radius that may be fixed from time to time according to the needs of the people, no licensed Purohit eligible by custom to
 - (1) perform the religious rites of any person is available, or
 - (2) the Vajamana-Kritya of more persons than one is to be performed at one and the same time, and, the number of licensed Purohits is insufficient, or
- (d) (1) To any person who performs the Antyeshthi (funeral obsequies) of any person, or
- (2) any other religious rites that may be determined by the Maharaja from time to time, or
- (e) To any person exempted from the provisions of this Act by Huzur Order.

- (4) Whoever is certified to have passed
 (a) an examination held pursuant to this Act,
 or
 (1) in Yajnic subjects, or
 (b) (2) in any standard of Dharmashastra of
 the Shrivana Mas Dakshina examina-
 tion, or
 (c) any other person deemed fit by the Maha-
 raja shall be granted a letter of authority.

These are the main provisions of the Act. Then follow other provisions among which are those relating to eligibility to appear in the examination and the power to frame rules regarding it. It is also enacted that a license of a Purohit is liable to be cancelled for misconduct. The last Section of the Act provides that :—

"No ceremony if otherwise valid shall be deemed invalid under this Act merely by reason of its having been performed by a Purohit who is not licensed."

It will be seen from the above provisions that H. H. the Gaekwar aims at regenerating the fallen Brahmin class. They were the leaders of the society and the pioneers of Dharma and knowledge in general in times past, and they can even now do much to elevate the society if they were only to equip themselves for the task. They have got their hereditary intelligence. What can they not do only if that intelligence is developed? Besides, the Brahmins occupy the highest position in the Hindu society, and, as such, they can do things with greater facility than others. And yet the Brahmins protested against the measure meant to elevate them. One is reminded of the story of that prisoner who when he was liberated from his prison-cell after having lived there for forty years humbly solicited the king that the only boon he sought from him was to be allowed to go back to his prison as he could not bear the light of day.

If one knows to what a miserable state the Brahmins in Gujarat have reduced themselves one can understand the protest. In a word they are darkly ignorant. Most of them know nothing of Sanskrit, not even the texts they have to recite. They mutter anything at the performance of ceremonies. They do not understand the meaning of what they recite: much less can they explain. Owing to these reasons they have fallen in the estimation of the people and do menial duties—such as cooking, drawing water, serving as *Hamals* and *sepoys*, etc. Our priests are frequently employed as messengers, attendants of brides, and hearers of invitations. If, therefore, they were to receive some

education they would rise in the estimation of the people and their status would be much raised. At the same time believers in ceremonies will have better satisfaction. And, as regards others, they will feel satisfied that they do not feed idle Brahmins. These are the laudable aims intended to be achieved.

Besides, the moral effect of law cannot be ignored. Society and law act and react upon each other. Law is usually the outcome of society, or sometimes, it may be the outcome of the greater intellects from among the people who make laws suitable to the order and progress of society. If, therefore, legislation is passed which is in advance of the people it may have one of two results. If it be of a kind entirely disregarding the existing condition of society it would greatly disturb the society and may, perhaps, come to be honoured only in the breach. If, however, it takes into account existing conditions and is yet in advance, like the present piece of legislation, then it is sure to have a salutary moral effect upon the people by throwing into discredit the existing defects and evils in society and impressing upon them the advantages to be gained by reform, particularly, where the legislation is opposed neither to the moral nor the religious sense of the people. Thus once the practice of Satee has been abolished by legislation it is now considered by every one, with rare exceptions, to be an inhuman practice, and to take part in it is deemed a heinous crime. The same may be said of Infanticide. So also there is in Baroda the Infant Marriage Prevention Act which, while condemning the practice of early marriages, inculcates the advantages of marriages at proper age, so that once the people are accustomed to marry their children at a later age they will continue to do so and a time may come when an infant marriage may be a curiosity and may meet with general disapproval. So also by the present legislation the standard of priesthood will rise, and, after some time, an ignorant Brahmin, following the profession may fall into discredit and be considered a disgrace.

Coming to the Act itself. There is nothing in it against which there can be any sensible protest. It has fully taken into account the existing circumstances and the difficulties to be coped with. It is mild and indulgent even to a fault. In

the anxious desire to guard the interests of the present Purohits greater latitude than legitimate has been allowed to them. Looking to the wording of Section 2 a Purohit if he succeeds in proving that he did not receive any consideration—and it would not be very difficult to prove so—he will be able to evade the law. Again, the Act allows a period of six years for preparation and does not apply to persons who are already twelve years of age. Provision is also made for cases where no licensed Purohit is easily procurable. Latitude is also given in the case of funeral ceremonies like Antyeshti, etc.

One feature of the Act deserves special

mention. It allows even non-Brahmins to qualify themselves as Purohits. This seems to me to be simple justice. For, if Brahmins, whose duties are confined by the Shastras to the preaching and practising of Dharma only, can take to any professions they like, there does not seem any earthly reason why others should be prevented from exercising the same right. The provision is simply permissive and no non-Brahmin Purohit is forced upon any one.

This piece of legislation is the first of its kind in India and its results deserve to be watched. It will be no wonder if other States follow the example with advantage.

A VISIT TO THE HOSPICE OF THE GREAT ST. BERNARD

SINCE my boyhood, when I read about it in my English reader, to me the name of "St. Bernard" always conjured up a misty vision of wild mountain regions, lonely travellers toiling upwards, huge avalanches falling, living burials in snow, exhumations by dogs, and nursing of half dead persons by monks. It was a mysterious place, akin to things belonging to the Fairy land, to be enjoyed through its stories in books rather than a sanctuary to be visited. This impression was so strong that although fond of visiting out of the way places I never thought of making enquiries about the possibility of visiting this place during my previous travels through Switzerland and Italy.

On the present occasion, while staying at the Hotel Byron at Villeneuve (a suburb of Montreaux) on Lake Geneva I accidentally discovered that I was not very far from the pass of the Great St. Bernard, and that it might be possible for me to go there if the road were clear of snow. It was the end of June, and I was surprised to learn that still the road may be blocked with snow. However I at once made up my mind to make an attempt to visit the place, and asked the Concierge of the hotel to make enquiries. He telephoned to a Hotel at Orsieres, the last railway station from which people have to proceed by road, and after an hour informed me to my great joy that everything was favou-

rable to my plans. The road was clear of snow, a carriage was available for the journey beyond the Railway and the hire of the carriage was only 20 Francs. I decided to start next morning and the intervening night was full of dreams of the Hospice of St. Bernard.

Very early next morning I drove to the Montreaux railway station and caught the fast train for Martigny. For sometime she ran along the bank of the Lake Geneva, and then I took a last view of it. After leaving the lake behind we entered the Rhone valley. Hills and dales, fields and forests, waterfalls and torrents passed in quick succession. And most of the time the train was following up the course of the river Rhone. She stopped at important stations only and that too for a very short time. We arrived at Martigny where we had to change, at about 3-30 o'clock. I looked out and called for a porter but could see none, and found it difficult to get out with my baggages, as ours was a corridor train with doors only at the end of the carriages and I had more baggages than is convenient to have with oneself while travelling in Europe. I had a suit case, a Gladstone bag, a hand bag, an overcoat, a stick and an umbrella. Just when the train was about to start a porter arrived and my difficulties came to an end. After getting out of the train, to avoid future

The Hospice of the Great St. Bernard and the V

trouble on the way, I put all that I needed for the journey in the gladstone bag, and deposited the suit case and the hand bag in the Left-luggage Office, and obtained a receipt for them. Thus lightly equipped I got into the electric train for Orsieres which was waiting. The electric railway from Martigny to Orsieres has been recently constructed and has made the Hospice more easily accessible. The train started at about 9-30 and passed through a most charming mountain country, clad in green vegetation and decked with a profusion of red and white blossoms, the scenery being varied by mountain streams and torrents roaring and forcing their way through the overhanging rocks. After Martigny there were no more towns; the train stopping at small villages, consisting of comparatively primitive and quaint houses not to be seen in the ordinary tourist's track. They were irregularly built houses of stone but much resembled the brick and clay houses of the poorer class living in towns in this country, except that they had roofs of slate and glazed windows, indispensable in cold countries. The number of passengers in the train was small and the Railway did not appear to have been working at a profit.

The train arrived at the terminal station Orsieres, which is situated in a charming

valley called "Val de Ferret," at about 10-15 o'clock. The porter of the hotel to which we had telephoned from Ville-neuve was waiting at the station. He took my bag and started for the hotel which was at a distance of a furlong only. At this time a well clad person came up and took the bag from the porter and sent him back to the railway station on some errand, and himself carried it. I afterwards discovered that he was the proprietor of the hotel. Arriving at the hotel I asked for someone who could speak English, as I could not trust my smattering of French and a few words of German for serious business. Fortunately there was a waitress who could speak a little English which was good enough for my purpose. I asked her whether arrangements were ready for my journey. She sent for the man who was to provide the carriage and after consulting him told me that the carriage was ready, but the road was not clear of snow, and if I insisted on going, I should be prepared to do a portion of the journey towards the end by walking, which might take an hour or so. I was taken quite aback. I was not in good health, and could not think of climbing an uphill road for an hour wading through snow at the end of a day's journey. On my asking why they had telephoned the evening before that the road was clear,

Benediction of the Statue of the St. Bernard of Monthorn 13 July 1905.

and expressing my great annoyance, the only answer I got was that some one had telephoned without making proper enquiries. There was no help but I was not to be thwarted easily, and it struck me that the information about the road that they were giving might be as unreliable as the information they first gave was admitted by themselves to be. So I made up my mind to try my luck. It was the 24th of June and from the 1st July they have a regular Diligence service to carry the post between Orsieres and St. Bernard and from that date the roads are regularly cleared when necessary. Sometimes they clear the road earlier as a preparatory measure. So the chances were that after all I might find the road clear.

I took my breakfast and started at about 11-15 o'clock for the Hospice which was 16 miles from here. The carriage was a small and light but roughly built two seated vehicle resembling a Victoria painted in bright red, yellow and black colours, the wheels having ornamented designs on them. It was quite in keeping with the simple and unrefined life around. The horse's harness had no less than seventeen bells which jingled merrily as we went along. A boy coachman was my only companion. We first passed through the narrow and crooked lanes of Orsieres village. The houses

were irregularly built of stone, the barns and cattle sheds being of wood. Cowdung mixed up with straw were heaped at places to be used as manure. There was a public hydrant in the middle of the village where women were washing clothes. The roads were muddy and the surroundings were not particularly clean. Other villages that I passed through after this were of the same type. After passing the village we began climbing our road. This was a good metalled modern road, which had superseded the old Roman road, which we often met and passed along or crossed in our journey. Napoleon and his great army while going to Italy to fight the battle of Marengo had crossed the Alps by this very Roman road. Our journey was almost all uphill, and we proceeded slowly, the coachman sometimes urging the horse with "hi-hi" "lu-lu" "ale-ale" and other such persuasive words which his horse alone could understand, and sometimes himself dozing off to sleep on the coach box. We proceeded through a grand mountainous country, our road winding slowly between deep valleys and towering cliffs. At places the slopes of the broad valleys were covered with meadows and corn fields, and the farmers were lying in their fields enjoying their midday siesta. We passed a few hamlets and then a big

village called Liddes. Just outside the village there was a big hay field so full of blossoms that it looked like a beautiful carpet. In the middle of the village there was a huge wooden cross fixed to a small platform and decorated with an artificial wreath. One house had a Latin inscription on the entrance door and two sun-dials on an outer wall. Here as well as in other villages I often saw men women and children sitting on the floor for want of chairs. Here and there we passed fir tree forests, but the trees were much smaller than the giant fir trees of the Himalayas. At about 2 o'clock we reached the village of Bourge St. Pierre which was one of the places where Napoleon halted on his way to Italy. It was now time for lunch, and I went to an inn which had the proud distinction of having provided breakfast to Napoleon on that occasion. Its name was Hotel du Dejeuner de Napoleon Premier (i. e. hotel of the breakfast of Napoleon I). It was a quaint old two storied house. After I had finished my breakfast the landlady showed me with pride the room occupied by Napoleon and the table on which he wrote his despatches. In the same room I was shown portraits of the grandfather-in-law and the grandmother-in-law of the landlady who were the keepers of this inn when Napoleon visited it, painted in oil. They were very poor daubs. From the window of the room a pillar of the Roman times could be seen. The whole place was indeed full of interest and memories of bygone times. We were now at a considerable height (5348 feet) and I had to put on thicker and warmer garments before proceeding onwards. At some distance from the village we passed the Swiss Customs House which guards this road. From here to the Hospice which is just within the Italian frontier there was no habitation visible except one or two unoccupied huts. We had not proceeded far when clouds began to gather and before long it started raining, and we passed on through the enveloping rain and the weird surroundings in silence. At some distance from the Customs House we found ourselves in the region of snows and to my great relief I found that the road had been cleared. Masses of snow were heaped up on both sides of the road, and at places the depth of the snow removed showed that avalanches huge enough to bury us and our carriage, had

recently fallen. Soon it began snowing, and as it were, a veil was cast on the whole landscape. It became dangerous to drive and the coachman had to get down and lead on the horse by the hand. We next passed the Grand Combe, otherwise called the Valley of the Dead, from the many fatal accidents which have occurred within its dreary precincts.

At last about 6-30 o'clock we reached the Hospice. It was situated at the top of the pass, known as the pass of Great St. Bernard, at a height of 8110 feet above sea level. It consisted of a group of buildings, the main building of the old Hospice being on the left side of the road. It was connected by an overbridge with a new annexe on the right side of the road. The entrance door in the main building was at a considerable height from the ground to prevent snow from closing it up, and is reached by a flight of steps. On the landing place there were a large number of boys and I wondered who they could have been. Later I discovered that they were students from a school on the bank of the lake Neuchatel and had come with their head master for a holiday excursion. They had walked all the way from Orsieres. I walked up to them and said that I wanted shelter for the night. One of them called a monk from inside, who took me to the entrance hall and rang a big bell which was hanging there. We had to wait a little and ring again before the monk whose duty it was to look after the visitors who came. I told him that I wanted shelter for the night. He at once welcomed me and took me to a room, which was to be my bed room, without asking me who I was and what was my creed. He ordered my bag to be put into my room and showed me the dining room and told me that the dinner would be ready shortly.

My room had wooden walls and a wooden floor. And the furniture—two beds a couch, a few chairs, a wash table, were all mediaeval, and the room looked like one of those that are fitted up in some of the European museums to illustrate the life of the people in the middle ages. There were however electric lamps and steam radiators which looked like anachronisms. The Hospice had its own electric installation, such as abounds in Switzerland on account of the free power that they can get almost everywhere from the waterfalls. The passages in the building some of which

An Avalanche of the Grand St. Bernard in Winter.

were not even of uniform width, were paved with rough and irregular slabs of stones. This building was constructed in the middle of the sixteenth century.

After a little rest I went into the dining hall and found it nearly full. There were about forty persons, mostly boys, some of whom I had met at the entrance door. Opposite to me were sitting an English tourist and his wife and I fell into conversation with them. The food served was rather coarse, but it was a wonder that they could still supply food to all. Every year during summer large numbers of adventurous tourists have been coming here for years past, and the monks according to their old custom have been extending their hospitality to this new class of visitors gratuitously, without any distinction of social position or creed. There is a box in the church of the Hospice in which people are expected to leave something for the upkeep of the institution, but few visitors take notice of it. The burden of the visitors on the institution is now so heavy that it is feared that it may not survive very long. After dinner the headmaster, some of his boys, the English tourist, his wife and myself sallied forth to have a look round. It had ceased snowing, and there was still twilight and so we could see the country round. Al-

though it was the end of June a lake close by was frozen. We saw from a distance the statue of St. Bernard, the founder of the Hospice, standing at the boundary line between Switzerland and Italy. We could not approach it as heavy snow blocked our way. Close to the Hospice is the mortuary where the bodies of the mountain's victims are laid. Near the annexe there were a number of St. Bernard dogs. They were big animals and with their heavy coat of wool looked grand. They were very quiet and hardly took any notice of us when we patted them on the back. After coming back to the Hospice I went into the church and left a small sum in the box kept there for the purpose. From there I went into the Hall where all the visitors and a few of the monks had assembled. I took an autograph signature of the father who was looking after us, and purchased some souvenirs of the Hospice that are sold here. I also wrote a few picture post cards and posted them—the hospice had its own Post Office. In the morning we expressed our desire to see the library, which was shown to us. It contained a large collection of religious books mostly in Latin. It had also a valuable collection of ancient coins and other finds of the Roman times that were

discovered amongst the old ruins over which the Hospice was built. I asked the father who was showing these things whether any other Hindu (In the Continent of Europe all natives of India are called "Hindus," as they should be called, and not "Indians") had visited the place before. He told me that once before a Hindu of the priestly class had visited the place. It was two years before my visit. I could not quite understand whether he meant a Brahman or a monk like himself. The Hindu visitor may have been one of the Sanyasins who are carrying on the work of the Ramkrishna Mission in America. They have occasionally been visiting Europe.

This Hospice was founded in 962 A.D. by St. Bernard de Manthon. The duty of the resident monks is to render assistance to travellers in danger during the snowy season which here lasts for over nine months. In

this work of benevolence they are aided by the dogs, whose keen sense of smell enables them to track and discover travellers buried in snow. During the long winter the cold here is intense and the dangers from storms

frequent and imminent. During that period the Monks have to suffer great privations. After some years' stay their health breaks down and they have to go down to Martigny where too they have a monastery.

I started on my journey after tea. The head master had requested me to take one of his boys who was unwell in my carriage and so I had a companion. The weather was very bad and it was bitterly cold, but as the journey now was all downhill, we finished it in less than four hours without stoppage.

We arrived at Orsieres at about 10-30 o'clock, and had my breakfast at the hotel, and then went to the railway station. My companion helped me in carrying my bag, which was rather too heavy for me to carry alone, as the hotel porter was absent. He himself remained there to wait for a party, who were expected to arrive that evening. At 12-30 my train started and I took a last view of Val de Ferret and said a final good-bye to this romantic region.

C. C. DAS.

TEACHERS AS RESEARCHERS

BY MANIK LAL DEY, M.A.

ALTHOUGH much has been said about teaching and research work in an article in the November (1915) issue of this journal, some more evidences may yet be adduced to support what has been set forth in it. In these days of progress it is in a backward country like India alone, that such absurd questions may be raised and debated upon. Born with the hands tied down with iron chains of religious laws, brought up amidst the rigid surroundings of social customs, we are like cage birds very loath to move when the barrier is broken. To men of such temperament a very high ideal of education is necessary in order to achieve any material progress. To commit to memory what others have discovered should not be the motto of a progressive nation. To claim the citizenship of the world, the brotherhood of any other advanced nations, to prove that we

are *men* capable of standing shoulder to shoulder with the members of the cultured nations, we should not keep ourselves satisfied with learning parrot-like what others have discovered, but should try our utmost to keep pace with the march of progress, and to prop up our head now and then with some new contribution to the knowledge and wellare of mankind.

If that be our ideal, the stereotyped teacher will be a poor guide indeed. In spite of his vast erudition, his long experience in teaching and in the management of classes, his dexterity in correcting notebooks and his zealously cherished method of cramming, he is but a living gramophone, reproducing the thoughts and expressions of others. Like a steam engine he can carry his train of students along the previously laid iron rails, puffing the steam and blowing the whistle, en-

shrouding his students with the smoke of his vast erudition,—his quotations and references,—at a rate characteristic of each individual. His students get but a cursory view of the fleeting panorama on both sides of the way, but the fields beyond, though they may be full of treasures and rich pasture lie unseen and unexplored. If such a teacher ever tries to swerve an inch from the iron pathway, his progress is at once brought to a standstill. What good will it be to mankind to follow the same beaten track over and over again? It will not enhance the progress, rather will it tend to check it.

If on the other hand our teachers be men who are capable of advancement both on the beaten track as well as on paths yet untrodden, will not their students get a better opportunity of study, a wider scope of education, and above all a stimulus to think independently and to do original work, which may be handed down to posterity?

The progress of a nation is judged by the number of original thinkers, and the amount of work they turn out. If we ever care to look into the condition of the foremost nations of the world we find that each of them can boast of at least a score of original thinkers in the different branches of arts and science. Not satisfied with the existing condition of men and things these researchers boldly march into untrodden tracks of learning, and often their efforts are crowned with success, and something new is added to the knowledge of mankind. In order to perpetuate this spirit of research, this fruitful labour calculated to uplift the human race, this unselfish struggle for the welfare of mankind, these mighty brains must have capable followers, who after being trained in the system of original investigation of their masters, may themselves form centres of research, rather than leave the discovering spirit to die out with its originator. It has been justly said by an eminent authority :—

"The discovering spirit is individual. It means a particular alertness, fineness, freshness, eagerness, born, not made. It is sacred and inestimable and it is a matter of lasting regret when it ends with its possessor and is not incorporated into the natural inheritance of the race."

The truth of this fact has been brought out into the lime light by all the cultured nations of the world. For a typical

instance we may mention Germany. "In his appreciation of the scientific spirit in Germany in the nineteenth century, Merz lays emphasis on the following features: the number and efficiency of the universities and the way in which these have devoted themselves to *teaching research*." For a particular instance we find: Ludwig (1816-1895) worked and taught in Marburg, Zurich, Vienna, and Leipzig. Professor Stirling writes of him, "From each and all of these centres his numerous pupils published under his direction and guidance an amount of work the extent and originality of which is probably unsurpassed. His own papers are epoch-making and he founded the largest school of physiologists of modern times."

One of the greatest authorities at present, in Physiological Chemistry is Dr. Abderhalden. As a professor he delivers lectures to his pupils daily, and in the evening he converses with them on the difficult portions of his subject. No one will deny his eminent success as a professor, the fact being fully established by the long list of his pupils. When we look into the amount of original work he has done we are appalled by the prodigious array of papers he has published, each and every one of which is the fruit of hard labour and deep thought. For instance, during the decade 1903-1912 he has published no less than 306 papers based on original research, with a train of pupils the number of which exceeds 150. If we think for a moment what this great professor and researcher, himself brought up in an atmosphere of original investigation under the great patriarchal chemist Emil Fischer, has achieved within so short a space of time, both in his professorial career and as an eminent researcher, training up a large number of pupils every one of whom is imbued with his spirit of original investigation carried down like the mantle of Elijah from professor to pupil,—shall we ever dare to question the appropriateness of teaching with research work?

Nor are these solitary instances. In England, we have men like Sir J. J. Thomson, the eminent physicist, who in the midst of his important research work does not forget to take his classes every day. So did Lord Kelvin before him. Few men in England could boast of so much original research work as these two

great scientists, yet they are none the less famous for their success as professors. In France, in Russia, in America, in fact in all enlightened parts of the world we have abundant instances of such men. Their success alone leaves no doubt about the compatibility of teaching with research. Even in India, at the very dawn of her modern progress, we find a few such men scattered here and there, who have already formed centres of crystallisation of original thought. In science, for instance, we may mention Dr. P. C. Ray who having struggled through enormous difficulties and baffled in various attempts, has, by dint of talent and perseverance, at last succeeded in founding a school of chemistry which has been aptly said to be "the nursery from which the future chemists of India pass into the world." With a score of pupils he has, in the course of the last few years, given out to the world the treasures of his original investigations in no less than 140 papers. In spite of his strenuous work in the laboratory he has

taken upon himself the task of teaching his pupils from the elementary to the highest standard. The progeny of successful students for the last twenty years bears testimony to the brilliant success he has achieved in his capacity as a professor. Also in history and literature we find men like Professors Jadunath Sarkar, Mahamahopadhyaya Satishchandra Bidyabhusana and Haraprasad Shastri who are as well known in their professorial career as in their original investigations.

Facts alone prove the truth and not theories, however simple or plausible. The truth which shines out through the mass of facts observed by different races of men in different countries cannot be gainsaid when it is found not to suit a favourite theory or a preconceived notion, since teaching and research go hand in hand in all the progressive countries of the world, with some advantage instead of hindrance to the professor, it is folly to raise the absurd question of their antagonism.

INDIAN STUDENTS AND WESTERN TEACHERS.

BY SIR RABINDRANATH TAGORE

(Translated from the Bengali)

I HAVE some hesitation in discussing the recent disturbance between the Presidency College students and some of their European professors. One reason is, that it may appear unseemly to do so. Another reason is, that where there is a tender spot in the relation between students and Europeans great care is needed about touching it. But yet, it is impossible to cover it up altogether. Indeed, it has already been uncovered, and the discussion is going on from mouth to mouth openly and in whispers. When a festering wound has accumulated poison, it cannot keep on containing it for ever. The wound breaks open at last. To blame this process of eruption is to blame the whole scheme of things. And Providence can very well take care of itself in such matters.

Now that the evil has come to light, clearly judgment has to be given and punishment to be apportioned. This is the critical time. The affair, as it stands, is hardly respectable. Therefore, for propriety's sake, if there must be punishment for somebody or other, it is just possible that it will take the line of least resistance, choosing the weak for its visitation. When the mistress of the house feels afraid of chastising her daughter-in-law, she generally finds it convenient, in fulfilling her duty, to beat her own daughter. And while the judges are active in their work the Principal of a Mission College has already sent to the authorities a scheme of discipline for our students.

All this sounds reasonable, because when students can combine to insult their

and such a living process can never be gone through, except with freedom and self-respect. Because such is the case, lads at this particular age become almost hypersensitive about their dignity. As, when a young child attains the age of mastication, its teeth come through with an inflammatory disturbance, so, when the time has arrived for a lad to cut his wisdom teeth, his sense of self-respect becomes almost painfully aggressive.

This, again, is the age when students are apt to break out into unexpected explosions. Whenever the relation between the teacher and the student is natural, these are allowed to pass by in the main current of events, just as drift and refuse are swiftly carried away in a flood tide, but become objectionable if deliberately dragged up to the surface in a net.

There is a law of Providence, which brings even Bengali students to years of discretion, when their inner faculties blossom out in self-expression. They aspire to attain the dignity of manhood, and their soul is eager to worship greatness wherever found. They are both self-assertive and receptive of outward influences at the same moment. They need sympathy and inspiration and a large atmosphere of life. But to invent disciplinary grinding machines for manufacturing lifeless pulp out of these human souls is a sacrilege against God.

When the prisoner breaks some prison rule, it hurts nobody to punish him severely, because he is simply looked upon as a criminal. No one takes the pains to consider, whether such treatment hurts his heart, because nobody views him from the standpoint of a man. A governor, therefore, exaggerates the least infringement of the prison regulations and visits this upon the prisoner.

Again, the drill sergeant, who undertakes the responsibility of drilling men into shape by military methods, naturally looks upon his recruits from a narrow and restricted point of view. And, in consequence, he makes his discipline felt upon them, in a way which hardly takes into account that they are human beings.

But we cannot look upon students either as prisoners, or as scrooges of an army corps. We have to make them into full grown men, clearly recognising the fact that man's nature is made up of delicate and living

Professors, it is not only an offence against propriety, but also against nature. For it is in human nature to feel respect towards those from whom we receive knowledge; and when we see any perversion of this natural instinct, we feel bound to correct it by artificial means. But before we resort to any of these methods, we should find out clearly, why there should be any perversion of nature at all.

There have been, in the papers, some pressing grave disapprobation concerning this last regrettable incident, especially because of the tradition of one immortal. But this very fact should make us all the more careful to find out the true reason for the outbreak.

I cannot hold it to be true, that the general attitude of the Bengali student is kind of special creation, unique in the opinion of psychology. Students, at the College stage, are always in a state of transition. For the first time in their lives, they have come out of school discipline into freedom. And even now freedom is not merely outward. Their whims, also, have left the cage of avants, and spread their wings into the open air of ideas. They have gained their right to question, and their right to judge for themselves.

This transition period of life is full of sensitiveness. The least insult pierces to the quick. (On the other hand, the simplest suggestion of love makes the heart glad. This is the time, therefore, when the influence of human contact is most powerful, because this is the time when man is moulded by man. The truth of this has been acknowledged everywhere. Therefore we have in our scriptures the verse:

"When the son has attained his sixteenth year, his father must treat him as a friend." A text like this implies, that at the adolescent stage it is necessary for the growth of life, that the son should know his father as a man, and not as an engine of discipline. This is the reason why, in all countries, university students are raised to a level, where they come nearer to their teachers and have living contact with them. This is the age when students, having completed the rudiments of education, begin to assimilate humanity itself;

fibres. When a man suffers from headache, it does no earthly good to strike his head with a hammer. To cure him, you have to be very careful not to injure any brain tissue.

There are men, even in these modern times, who have entirely simplified the science of pathology and have accounted for all diseases by the theory of devil possession. They, like this Principal of a missionary college, want to drive away the disease by beating and branding and making unearthly yells. It is an admirable method of driving away the disease,—and the best part of a patient's life with it.

But this, of course, is mere quackery. Those who are skilled doctors do not look upon disease as an isolated thing in one part of the body. They recognise the intricacy and delicacy of the whole human system, and, while attempting to cure the special ailment, they do not cut at the root of vitality itself.

So my suggestion, in the present trouble, is this. Those teachers, whom nature has marked out for gaolers, drill-sergeants, and exorcists, should never be given the special care of students. Only those are fit for such work, who have a natural feeling of respect even for the young in age and in wisdom, who understand the Sanskrit verse,—“Forgiveness is the adornment of the powerful”, and who have no hesitation in accepting their students as their friends.

Jesus Christ has said,—“Suffer the little children to come unto me and forbid them not, for of such is the kingdom of heaven.” Christ had respect for children in his heart, because the suggestiveness of perfection is in the child. When the adult becomes hard in habits and opinions and in self-conceit, he loses all that suggestiveness. Then it becomes difficult for him to come near to the Teacher.

The minds of students are always expanding. The spirit of growth is ever doing its work in the core of their life-buds. The process of development has not stopped in them. They still carry about with them this suggestiveness of perfection. For that reason, the true teacher respects them, and suffers them to come near to him in love. He forgives them all their short-comings and patiently helps to open out their minds towards freedom and light. But those who, in their pride of greater knowledge or of social or racial position, are ready to insult the

student at every step, will never receive homage from them; and so in despair they will attempt in vain to extort obedience and reverence by the help of stringent regulations and official myrmidons.

Those who want to bind students hand and foot in the meshes of their disciplinary rules should understand that they are doing the greatest harm to the teachers themselves. For there are very few men in this world, who can keep straight in the path of duty simply by the help of their own inner ideal. Most people are preserved from going astray by pressure from the outside. They cannot betray themselves into doing wrong, because of their responsibility to the people with whom they have to deal. Therefore, wherever there is slavery, it is degrading to the masters. Where Sudras are Sudras indeed, there the Brahmans deteriorate.

But it may be asked, whether teachers should put up with every form of students' wildnesses. My answer would be that students will not go wild. They will act with respect, if they themselves get their due respect from the teachers. But, if the students' own race or religion is insulted by the teacher, if the students know that for themselves there is no chance of justice, and for professors of their own nationality no fair treatment, then they are bound to break out into impatience; and, indeed, it would be a thousand pities if they did not.

But the professors have a reasonable argument on their side.

India, for Europeans, is a land of exile. The climate is depressing. The food and drink which they take, in the hot weather, are often too exciting. Our complexion, religion, language, and habits, are most annoyingly different from theirs. Over and above that, every European teacher carries about with him on his person the emblems of sovereign power, and so the throne takes the place of the *guru's* seat. For that same reason, the European professor does not look upon his vocation simply as that of a teacher. He feels himself also to be a king of the country. He is a European and a Professor of an Imperial Service to boot,—a fragment of royalty. Often, also, he suffers from the conviction that he has come out to ‘do us good.’ In such circumstances, he may not always feel the necessity of controlling his tongue, or his temper. Therefore it may be the case, that we should not ask

how he ought to behave towards the students, but rather how the students, by the agency of a strict scheme of discipline, should train themselves to put up with his want of good taste.

Let us, then, frankly acknowledge the natural difficulties of a European professor in dealing with Bengali students. We sometimes quote the instance of the relations of Oxford and Cambridge Dons with their undergraduates. But the cases are not parallel. There, the relationship is natural. Here, it is not. So it appears as if this vacuum in nature has to be filled up with brickbats of 'discipline.'

It is this fact that has made our own problem so difficult for us. This is the reason why the prudent men of our community advise their sons to be content with passing examinations, and never to bother their heads about their privileges as men.

It is sound advice. Only unfortunately, it does not answer. Human nature is not built upon the hard foundation of prudence. It has to grow, and therefore is always immature. It tolerates all artificial restrictions up to a certain point. Then suddenly all barriers burst, and the irrepressible life manifests itself when we least expect it.

If we recognise nature only on our own side, and defy it in the student, then, for some length of time this one-sided arrangement may pass muster. But at last, all of a sudden, we discover that it has become obsolete. At that, our indignation knows no bounds. The very sign of life becomes a crime, because it has been so silent all the while. And so the punishment far transcends its normal measure. Then the whole affair becomes so complicated that even the *panchayat* Commission may become unable to find its way through the jungle, and feel compelled to use axes and hammers, and fires and steam-rollers, in order to blaze a path.

We have long ago grown accustomed to being reminded that the kingdom of heaven, specially reserved for our Bengali students, is the opium-eaters' heaven, the passage to which is cheap, and the path safe and peaceful. We have been informed that our students have friends, who are willing to take any amount of trouble to ferry them over to this inertness of illimitable subservience, relieving them, at the outset, of such inconvenient baggage as the living

soul. If their scheme could work for good, I should have nothing to say against it.

But it is doomed to failure. And it has failed in our case, because our education was not merely at the hands of College Principals, or those who are overburdened with the benevolent task of doing us good. We have been taking our lessons from England itself, and the time has been more than a century long. Those lessons have not been altogether lost upon us. They have quickened our life, and life has its claims which cannot be ignored.

I well remember, when I was a boy, how I had to learn the English synonyms of English words. I was made to get by heart the meaning of the pronoun I. It was given thus,—“*Myself*—I by myself I,—the first personal pronoun.” It took me some time to learn this definition, and it has taken India a considerable time also. Now, when we have almost succeeded in learning it by heart, our present schoolmaster comes and threatens to cross out that word ‘myself’ with black ink and rub it out altogether with rubber,—yes, with India rubber.

Our school-master is now teaching us in this way :—

“The meaning of the English pronoun ‘I’ has to be different in your country from that of ours.”

But if we took nearly two centuries to get our first lesson by heart, surely it will take at least double that time to forget it. Because that magic charm of the English ‘I’ is very potent. If our *guru* had not whispered it into our ears from the beginning, no great harm might have been done. But now, it has passed through the portals of our ears into life itself, and you can only tear it out by pulling up the very roots of life. And life is very tough after all.

So long as England keeps its touch with India, she will never be able to forswear her own nature. The best that she has, she must impart to us, willingly or unwillingly. This is God’s will,—whether it accords with the will of the Mission College authorities, or not.

Therefore, our students will never be satisfied with merely scraps of lecture notes and logic and grammar. They will stand out for their own life of self-respect. They will never take themselves to be mere puppets, or allow themselves to be unjustly coerced into submission. This

attitude of mind has become a fact to-day. It is possible to treat it as a delusion: it is possible to abuse it; but it is impossible to ignore it. By striking a blow at it, you only give it an opportunity of proving itself all the more true.

If the discussion about the Presidency College were merely some local affair, and nothing more, I should not take the trouble to write about it. But there is a large question intimately connected with it, and I should be wanting in my duty to my country and to the government if I remained silent.

Man's history unfolds itself differently in different countries. India has a history of its own, and we can trace out, how from the very beginning that history has been confined to no particular race or civilisation. Dravidian culture is as truly a part of us as Aryan. Our country belongs to the Hindu as much as to the Musalman, and to the Musalman as well as the Hindu. This is why history in India, with its collision of different forces, like gaseous bodies, has been hitherto so nebulous. There is agitation of different elements: there are explosions and upheavals: but there has been no fixed and definite shape. No single voice of one clear outstanding identity has come out of this pervasive vagueness as yet.

When the crystal is in a liquid state, it is amorphous. And our history has been like that for ages. At last, from the western shores of the world, came a shock which ran through this liquid mass from one end to the other. Now we feel an all-penetrating impetus running through its atoms. It is the movement which precedes the crystallising act.

All this proves my contention, that Indian history is the history of the Aryans, the Dravidians, the Muhammadans,—and of the Englishmen as well. We have to see that all its component parts are welded together into one organic whole. To desire to get rid of any one of these parts, is beyond our power. We have not been able to leave out the Musalmans, and we shall not be able to leave out the English. This is not simply owing to our want of physical power, but because it is in the constitution of things. Our history belongs to no one race. It represents a fusion of forces.

The historical purpose, which is being formed by the combination of various races and ages and civilisations, we must accept.

We must make our own conscious purpose in harmony with it. We must keep ever in mind, that our country is not England nor Italy, nor America, but India. The history of other countries would never fit ours. The difference lies at the very root. Those other countries had some sort of unity to build their history upon. We had to deal with diversity from the very beginning. History, in other countries, is naturally concerned with rejecting whatever is alien. The history of India is naturally concerned with assimilating all that has come from the outside.

So long, then, as the English element remains entirely alien and external, India will suffer. So long as Government is something extraneous and mechanical and un-natural, the Pax Britannica will give us an absence of war, but not a fullness of life. That is to say, the English will not be in union with the creative genius that is moulding India to its own purpose. The English will be, rather, like a mere labourer carrying materials of all kinds and heaping them up in heaps. This latter is what an English poet has described as 'the white man's burden.'

But is it going to remain a burden for ever? Should there be no joy of creation? It is the Creator Himself who has called the West to India. If the English cannot partake in His creative work, then the hot desert path of the 'land of regrets' will be strewn with their graves, and yet they will have to bear the burden to the end, unrelieved. If they do not contribute their life to Indian history; if, instead, their work in India becomes a mere matter of duty and routine; then they will make the divine spirit of our Motherland suffer, and they will suffer themselves.

Therefore, the problem of history in India is not to throw off England, but to make England's relation to ourselves living and natural.

Up till now, Hindus, Muhammadans and other races in India have been unconsciously shaping the destiny of our country. But since the arrival of the English we have become conscious of the part we are to play, and our own will is now about to take its share in the moulding process. The two wills may clash. There is the danger of conflict between them. But those of us, who know the great purpose of our own history, can remain undisturbed. In

all these conflicts of wills we must have faith, and try our best to bring harmony out of the very throes of division.

We want Englishmen: otherwise Indian History will remain incomplete,—its purpose unfulfilled. And because we want Englishmen, we must have entrance into their hearts, not merely to their office rooms.

But if we allow Englishmen to go on despising us and treating us with contempt, then we shall never win their hearts. We must claim respect from them. And, at such a time as this, we shall not turn the other cheek when struck by the Principal of a Mission College.

Where, then, can the relation between the English and the Indians be absolutely simple and natural? Not in the trade markets; not in the political arena.

The best place is in the Universities, where knowledge is imparted. For ideas unfold hearts. And when hearts are open, then comes the best opportunity for reaching them.

This great opportunity of closer intimacy existed in our own University. Here the Englishman could find a seat waiting for him that was greater than a throne. It is when we see such opportunities wasted, that we feel a pang of regret.

That this loss has been brought about by the students only, I, for one, cannot believe. I know our students intimately. They differ from Western undergraduates in this, that they are eager to worship their teacher and their hearts are extremely easy to win.

This was the reason why I always wanted to have some English teachers for my own school at Bolpur. Years ago, I had one, an Englishman, who had grown sour in the atmosphere of India, and accumulated a superfluity of spleen. He used to revile the boys about their nationality. He could not but hold them responsible for having been born of Bengali parents. And though the boys were quite young, they struck, and would not go to his class. Even the headmaster's orders proved ineffective to bring them back. Then I was compelled to step in and relieve 'the white man's burden.'

But I never gave up hope, and my expectation has been fulfilled. My *Ashram* has become sacred by the communion of English teachers and Indian boys. This sacred union, for which God has been

waiting in India for so long, has put forth one little flower in one corner of India's vast expanse. The two English teachers who have come to me, not for preaching their own religion, nor for raising the fallen, have no presumptuous thought that they had their birth in this world to 'civilise the barbarian.' But they, like their Master, have spread their arms to the children, saying, 'Suffer the children to come,'—though they are Bengali children. And the children did not hesitate for a moment to draw near, though they were Englishmen.

This I can say truly, the pure relation of love, which has been established between these boys and their English teachers, shall abide. And these boys will not enter upon life with their hearts filled with the poison of hatred against the English.

That first English teacher, who had come to me, was a very efficient and experienced teacher. If he had continued in my school, the boys might have acquired perfect English pronunciation and grammar. That might have tempted me to compel the boys by punishments to come to his class, and I might perhaps have persuaded myself to believe, that, however unjust and rude he might be, it was the duty of the children to submit in silence. Possibly, for some days, they would have felt miserable, and then, what is worse, after a time they would have grown callous and indifferent,—while their English accent would have been growing more and more perfect. But these little children,—have they not God on their side? Are we called upon to take the part of Providence in their lives, just because our hair has grown gray? Could I hope to meet God's judgment,—on the strength of a perfect English accent?

The real reason why the relation between European Professors and Indian students has become so difficult was revealed to me one day in England, when I was travelling in a railway carriage. My fellow-traveller, an Englishman, was at first favourably attracted by my appearance, so much so that he thought,—and took the thought with equanimity,—that I had come to England to preach some better religion. Suddenly he felt curiosity to ask me, from what part of India I had come. And when he was informed by me, that I came from Bengal, it seemed to give him a great shock. Then his vocabulary showed an amazing richness in its terms of vilification of the whole Bengali people.

When, for some reason or other, we happen to get a dislike for some race of people other than our own, then every person belonging to that race becomes to us a mere abstraction. To my fellow-passenger I lost my personality directly he heard that I was a Bengali. After that information I became merely an objectionable quality. And with a mere emblem of an abstract quality there is no need to preserve even ordinary politeness.

There was a time when Englishmen did not like the Russians. Then the Russian became a mere adjective to the Englishman, the symbol of something objectionable. But, now, in the English newspapers we hear nothing but praise of the Russians. The fact is that, directly you remove a man from the category of the adjective to the category of the noun, then at once all his human qualities become evident and obstacles to natural treatment are removed.

Because the Bengalis have become a mere adjective to the Englishman, signifying dislike, it has become difficult for the latter to feel our reality. I had hoped that Bengali youths might have been taken as volunteers to serve in this present war. If we could sacrifice our lives,—so I thought,—in the same cause with the English soldiers, we should at once become real to them, and claim fairness at their hands ever after.

But that opportunity has been refused, and we still remain behind the screen of vagueness. And man suspects vagueness. In Bengal, I do not know a single individual Bengali, who is not labouring under this suspicion in some form or another at the hands of the higher authorities. In this twilight of suspicion the shadows seem to take the semblance of substance and the substance that of shadows, and misunderstandings multiply fast and frequent.

But can this darkness be removed by raising dust with more and more punishment? Is not *light* needed more than anything else,—the light of love, the light of sympathy, to see each other's faces and understand? Is not this the proper time, when it behoves all Principals of Christian Colleges to remember

the life and teaching of their Master? And is not 'charity' described to us as the 'greatest thing in the world'? The shadows of misunderstanding, which distort truth, can only be removed by those who are above us in position. Only the sun can dispel the mist. Those who advise the higher powers to hurl thunder from the skies when rain is needed, are not only showing a lack of generosity, but also giving evidence of cowardice. Because most of the tyrannies of this world are the outcome of fear.

In conclusion, I entreat those in authority to bear this in mind, that we could have hoped that the Young Bengal of to-day might have carried reverence and love for Englishmen into the world from those universities where they had come in touch with their English professors. This would have surely happened if, as *gurus*, these teachers had been able to win their hearts when their hearts were fully susceptible to love. But, on the contrary, if this relation between teacher and student be founded on fear and hate and punishment, then the poison of the disease will be driven from the blood into the very vitals. Distrust of all Englishmen will be transformed into an instinct from one generation to another.

That this will hinder the work of good government is trifling, compared with the evil that will arise by the interruption of free intercourse between the two peoples. For this will deprive us of the best gifts we might have received from the West. When the act of giving is accompanied with respect, the act of receiving with respect becomes possible also. But when the prisoner sits down to eat with his handcuffs on, it is difficult to persuade him that he is an honoured guest at a festival. And this festival of knowledge is a feast of joy. But those who are for ordering iron hand-cuffs for their guests will to-morrow flatter themselves on their own righteous conduct, and complain that after all their efforts, they have not been able to win the gratitude of these youths, while deep down in their heart of hearts, they are more and more, each day, uttering the prayer,—'Father, do not forgive them.'

THE IRISH RENAISSANCE

BY JAMES H. COUSINS.

A FEW years ago an Irish girl in a French school found herself registered as living at "Dublin, England." The inferred absorption of her native island, Ireland, by England, not merely politically but geographically, was more than the girl could stand. Her sense of scientific accuracy, added to a sudden emergence of racial pride, prompted an energetic protest that she was not English, but Irish.

The learned authority, overlooking the mere fact that the piece of land called Ireland entirely surrounded by water, of which the City of Dublin is the Capital, cannot by any stretch of imagination—or rather of want of imagination—be coincident with the other piece of land, called England, which lies to the east of it, countered the girl's protest by exclaiming, "But you speak the English language!"

The reply, striking the mind of a spirited and gifted girl in a moment of sensitive exaltation, went deep into her consciousness. She immediately took up the study of the ancient language of her country; took her degree later as Master of Arts, and a three hundred pound prize, with the Irish language as one of her main subjects; and ended her life at the age of twenty-five in an attempt to save a fisher-girl from drowning off the coast of a lonely island, to which she had gone in order to perfect her colloquial knowledge of the dialect of the Southern province.

I recount this biography-in-brief, (in the last stage of which I was myself tragically concerned) because it embraces several of the circumstances which have made Ireland one of the world's enigmas—a perpetual puzzle to the outsider by reason of the periodical reappearance of evidences of youth and virility in an entity which, in the intervals between reappearances, has been apparently dead, or at least in senile decay; a no less perpetual puzzle to the insider because of the lack of a psychology that will demonstrate the essential unity of the forces that threaten at times to rend the country asunder.

During the last quarter of a century Ireland has made her latest, and perhaps most significant, reappearance. Within her borders there has emerged an amazing intellectual activity which, at one end, has dug deep into the earth in the application of social and aesthetic ideals to the problems of agriculture; and at the other end has developed, in the Irish language, but principally in English, an expression in literature which takes tribute in technique from all the world, yet keeps itself securely rooted in racial intimacy with life on the land, and in racial search for the life that lies deeper than life or land.

To the people of Ireland, or at least to the conscious minority that stands for, but not instead of the inarticulate majority, the importance of the intellectual upsurge of the last twenty years has never been underestimated: the importance, that is to say, of the achievement of a mode of expression that would be intelligible in the ears of the world, not as the cry of a political sect, which might or might not be worthy of attention, but as the voice of a people finding freedom in the Arts. Isolated as her soul has been behind an alien language and outlook, she has been in times past compelled to sing to herself about herself in order to keep up her spirits and to preserve her sense of identity. But preoccupation with the *genius loci* does not make for commerce with the genius of the world, since it must necessarily deal largely with places and events of untranslatable quality and value even in the island that lies nearest to her.

Now, however, through the transmuting power of the imagination, and the universal currency of the language of the Arts, Ireland has caught the ear of the world; and what is more important to her, has caught the ear of herself. She has lifted up her voice in Beauty; it has been heard from the Petrograd to San Francisco; but its greatest achievement has been its echoing and re-echoing within her own borders, across the river (the Boyne) that

geographically, historically and temperamentally has divided North from South, Protestant from Catholic, Nationalist from Unionist. The new order of creative spirits which have incarnated in the country within the last half of the nineteenth century, have overleaped the arbitrary boundaries of religious and political creeds, have undermined social obstructions, and have laid the foundation in thought and word, for the future rebuilding in laws and institutions of the communal life that is natural life of the Celtic race. Other races may proclaim the "*vox populi vox Dei*;" it is the privilege of the Irish race to maintain that the voice of the artist is the voice of the people; for the people themselves are of the race of Hermes, actors and poets from the cradle. And that is why "Dublin, England," smites a protest from a vibrant daughter of Ireland, proud with the pride of race and the pride of the Artist.

Side by side with this modern development in Ireland itself, there has been evident in the world at large a growing understanding of what Ireland signifies. Ireland herself has no doubt on the subject. It is a simple fact of Irish life that, no matter what abysses of illusory difference open up between a disputatious Irishman from Ulster, and an equally disputatious Irishman from Munster, they are both well aware that Ulster and Munster are mere adjectives, and simply introduce a pleasing excuse for antagonism between units that are fundamentally in Union, and, as Irishmen, entirely distinctive from the rest of humanity. To their view, therefore, the growing understanding of Ireland in the world-consciousness has figured itself as a hazy background which has gradually condensed and shaped itself, at first inchoately, but latterly with some remote recollection of the real Ireland.

To the majority of outsiders, Ireland has been known chiefly as something in English politics—a kind of disease that curiously broke out in a symptom called Home Rule when parties in the British Parliament were pretty evenly balanced. If there was really a place called Ireland outside London, it was probably very barren, miserable, illiterate, behind the times, and obviously in need of being governed by some one else. Not many years ago, a kindly old lady in London asked the writer in all seriousness if there were tramcars in Ireland. That was before the

era of universal electric cars; and it was from Dublin to Kingstown that the first electric tramway in the British Isles was laid. It was also a Dublin Company that sent the first steampacket across the Atlantic to New York, and characteristically enough, its starting point was not Ireland, but the English port of Liverpool.

Such ignorance was not however, confined to outsiders. The writer's own idea of Ireland and the Irish people—an idea which he had imbibed in his native city of Belfast in the early eighties—was such that when he went for a sea trip to the south of the island, he armed himself with a revolver and fifty cartridges as protection against the natives! Instead of which he spent several hours on the quayside of Waterford in a pleasant chat with a quay labourer, whose quick wit, picturesque speech, and kindly spirit disarmed the writer. Through him he discovered Ireland, and celebrated the event by firing the whole of his cartridges into a delicate gate on the side of Mount Misery the day after.

That was over a quarter of a century ago. The foundation of the Irish Renaissance had been well and truly laid, but the superstructure had yet to appear. In due time it reared itself stage by stage; and whereas in those days no line of the inimitable poetry of Yeats had yet been made public, now he has the seal of European approval in a Tauchnitz selection. Lovers of literature on the continent of Europe were not long in recognising the coming of a new spirit into letters; and when poet after poet made his and her appearance and ultimately blossomed into book form, whispers of the Irish "School" began to be heard across the Atlantic.

A few years ago, when passing through the ancient Norman City of Bayeux, in the north of France, a chance word from the writer after dinner in the hotel drew towards him another passing stranger, who had sat silent and apart during the meal. He at once ferreted out the writer's connection with the Irish Literary Movement, became alive and enthusiastic over a mutual interest, and disclosed the fact that he was a Professor in an American University in the eastern States, and that the work of the modern Irish writers formed a large portion of their literary studies. This is but one example out of many instances bearing testimony to the keen

interest which is everywhere being shown in the new reappearance of Ireland.

That reappearance is not of course confined solely to literature. Like all true emanations from the spiritual hinterland of race, it affects all phases of the complex national life. The literary revival has for true brothers the Language revival, the Industrial revival, the Agricultural revival, and a complex political agitation. To each of these, due value must be assigned; but, singly or totally, they do not stand for more than a fragment of the new Ireland. Ireland is not a linguistic country in the continental sense. She is passionately interested in preserving the Irish language, not because it is a language, but because it is Irish. She is not an industrial country in the manufacturing sense; but her industry, as a quality in human activity, is enormous. She is not an agricultural country in the Canadian sense: she holds tenaciously to the land—and in some places to land that is only so-called by courtesy, being in truth naked rock—not because she can make it a source of wealth, but because it is Ireland, and her own by history, sacrifice and love. She is not a political country, notwithstanding a century's preoccupation with politics. The history of Ireland, in which politics form so conspicuous a part, is not—as presented by historians up till recently—the history of the Irish nation at home, but the history of English politics on Irish soil; and the political activity of Irishmen and women in England has not been the spontaneous exercise of a genius for politics, but an evidence of special versatility adapting its single purpose of freedom of Ireland to the constantly changing exigencies of English politics.

In whichever of these activities Irishmen and Irish women take part, they do so with distinctiveness. They will enter with the bravery of children on enterprises demanding experience and skill. If they succeed and they mostly do—their success will be abnormally rapid. If they fail, their failure will probably become of national value through its intermixture of idealism and sentiment. They will, by dint of racial enthusiasm and fineness of response, quickly and thoroughly master the intricacies of activities which from other races would demand some renunciation of the soul, but which come no nearer the soul of

Ireland than she is willing to permit. They will enter into controversy with such abandon of impersonality that they will indulge in personalities of the most violent nature without danger to the person, character, or soul of either side in the dispute. The path of Irish politics is strewn alternately with broken friendships and buried hatchets: the protagonists march on, at one time hand to hand, at another time arm in arm.

In these characteristics, there is the indication of the working of Ireland's particular gift to the world, the spirit of democracy. What shape it might have taken had the Norman invasion not diverted her attention, and pursued the policy of "divide and conquer," it is perhaps futile to enquire. One thing, however, is certain, and that is, that the spirit of national unity which survived through seven centuries of alien rule, to win ultimately her recognition in even a partial measure of self-government, is capable yet of taking the circumstances of to-day in both hands, and moulding them to her vision of a free Community, united in the hidden law of the spirit; and from her spiritual centre developing in all directions towards the fullest expression of an amazing diversity. She has broken the power of an irresponsible landlordism: she may, or she may not, influence the coming adjustment of the rival forces in the economic life of Europe and the world: but whatever may be her specific business, behind it and through it will radiate the essential spirit of a true national democracy. Given free scope for the exercise of her genius, she will bring all things to the test of the race consciousness, and not to the test of another's. Her artists will go—are going—to her own life for their inspiration. Her life will be adjusted—is even now adjusting itself—to the dreams of her poets and seers. Thus her life will be organic, unified; free in circumference, yet held by an invisible centre in the spirit; and thus, building a fair habitation for her own genius, she will hold out friendly hands to other nations that are moving towards freedom, encouraging them with her dream, on a cosmic scale of her own national ideal, men and women grouped by blood, but chiefly by spiritual bonds, in such wise that each may realise the best within themselves after their own law, and thereafter seek for the ultimate

unity of all mankind, not in the imposition of alien customs and ideas, but in free voluntary exchange, which is the one and only sure basis of lasting union.

REVIEWS AND NOTICES OF BOOKS

ENGLISH.

THE MAKING OF BRITISH INDIA, 1756-1858, described in a series of Despatches, Treaties, Statutes, &c., by Ramsay Muir, Professor of Modern History in the University of Manchester (Longmans, 6s. net).

This is a compilation judiciously made from documents written in English and by Englishmen relating to the rise of the British Supremacy in India. The author has not considered it worth his while to consult contemporary documents written by non-Englishmen. The works of French, Dutch and Muhammadan historians deserve consideration. But the author has ignored their importance. His work is more indicatory than exhaustive. However, the book is a useful one and deserves to be read by those who are interested in the "Good old days of the East India Company's rule in India."

R.

I. CLARINDA. By A. S. and K. K. Raghav. Pp. 12. Price 1s. 6d.

Clarinda was a historical character. She was the widow of a Marhatta Brahman who had been one of the king's servants at Tanjore. After her husband's death she became the concubine of an English officer of the name of Lyttelton who, strangely enough, instructed her in Biblical histories and Christian doctrines. She requested Schwartz, a famous missionary of those days, to baptize her, but was refused because of her "sinful connection." She was not prepared to give up Lyttelton then, but when he died she repeated her request to the missionary and was accepted. She was baptized at Palamcottah where she later on built the first Christian Church in that part of the country.

This is all that can now be gathered about the life-story of Clarinda from contemporary records. Mr. Madhaviah has endeavoured to fill up the gaps in her story from his own imagination and the result is a novel full of human interest and eminently readable.

II. MUTHUMEENAKSHI. By A. Madhaviah. Translated from Tamil by one of his daughters. Pp. 121. Price 1s. 6d. K. Raghav, Chennai, Chingleput Dist.

Muthumeenakshi was a Brahman girl whose sad and sorrowful life was typical of the lives of thousands of girls in our country. Mr. Madhaviah describes the cruelty of the step-mother, the tyranny of the mother-in-law and the misfortunes of the wretched widow, to borrow Sir Sankaran Nair's phrase, "with the precision of direct knowledge." We hope this book would be widely read.

III. THE FATAL GARLAND. By Mrs. Ghosal. Pp. 321. Published by Messrs. J. Wilson & Sons, Ltd. 17, Chancery Lane, London.

Mrs. Ghosal, as our readers must be aware, is a sister of Sir Rabindranath Tagore and bids fair to achieve literary fame among the English-reading public. "An Unfinished Song," Mrs. Ghosal's first book in English which was published, we believe, a

little over a year ago, was very well received by both the Indian and the British Press. The book now under review more than maintains the standard of her first venture. The scene is laid in Bengal at the time when Sekandar Shah occupied the Imperial throne and Raja Suryadeb held the chieftainship of Dinajpur. Shakti the heroine of the Fatal Garland, was selected as Rani by Ganesh Dev, the Prince of Dinajpur and garlanded by him in childish play. The prince, however, when grown up, married her rival playmate, Nirupama, while Shakti was away on a pilgrimage. Shakti's grief was unbounded when on her return she heard of the Prince's marriage, because ever since the prince had garlanded her with the "Fatal Garland" she looked upon herself as his bride. The Prince's refusal to marry her drove Shakti from grief to anger and from anger to revenge. She went and married Ganesh Dev's Muhammadan rival, Ghias-ud-Din, who afterwards, became the Sultan of Bengal. Ganesh Dev was imprisoned by Shakti's husband and ordered to be beheaded. Shakti, however, unable to forget her love for him, managed to save his life and give her own instead.

This is the bare outline of Mrs. Ghosal's tale but she has worked into it a whole world of passion and interest. The book contains a number of charming illustrations.

IV. CHARACTER SKETCHES OF FAMILIAR LIFE. By A. Ramanujswami, B.A., B.L. Pp. 253. Price 1s. 12. Published by the author at Bocharapur (Ganjam).

These character sketches of Hindu social life, the author tells us, have been inspired by a study of the famous "Sketches by Boz." In our judgment, however, there is an important distinction between Boz and Mr. Ramanuja Swami inasmuch as Boz was an artist first and a social reformer afterwards, while the reverse of it seems to be the case with our present author. Mr. Ramanuja Swami's book is a collection of two short stories, unfortunately mixed up in printing as if they were one, which have been written to advocate the cause of social reform in Hindu society. It contains several passages of genuine humour and would pleasantly while away a few leisure hours.

V.—VII. LOVE, THE CONQUEROR OF DEATH. Pp. 126.

FAITH, BELIEF AND CREDULITY. Pp. 8. 3s.

THE PURPOSE OF LIFE. Pp. 8. 3s. Madras: The Christian Literature Society for India.

A series of reprints from the *Epiphany*.

VIII. THE FORGIVENESS OF SINS. By G. G. Fandiay, P.D. Pp. 16. 6s. Madras: The C.L.S. for India.

IX. THE SUPER MAN AND THE SUPER-NATION. By Cambridge. Pp. 16. Price 1s. Anna. C.L. Society, Madras.

A scathing denunciation of the philosophy of Germany's teachers Nietzsche and Treitschke—from the British Christian viewpoint.

X. HOW DO WE STAND TODAY? *Pp. 35. Price 1s. 6d. Fisher Union, Ltd., London.*

This is a reprint of the famous speech delivered by the Prime Minister in the House of Commons on the 2nd Nov. 1915, in which he reviewed the operations of the Allied Forces in all the different theatres of war and which would be always remembered for its defence of the British action in the Dardanelles.

XI. SIR EDWARD GREY'S REPLY TO DR VON BETHMANN-HOLLWEG. *Pp. 20. Price 1d. Fisher Union.*

A letter addressed to the British Press on the 25th Aug. 1915 by the Secretary of State for Foreign Affairs in reply to the German Chancellor's allegations that Belgium had, before the outbreak of the war, trafficked her neutrality with the English and was in effect in a plot with the Allies against Germany. The statement issued by the Foreign Office respecting the Anglo-German negotiations of 1912 is printed as an Appendix.

XII. SPEECH OF HIS EXCELLENCY SIGNOR ANTONIO SALANDRA. *Translated by Thomas O'By. Pp. 32. 6d. Fisher Union.*

This is a translation of the speech delivered by the Italian Prime Minister on June 2, 1915, in the Capitol of Rome at the outbreak of hostilities between Italy and her former allies—Germany and Austria. The speech is an effective but dignified reply to the charges of "treachery and surprise" addressed to Italy by the German Chancellor. It is of course easy enough, as Signor Salandra remarks, "to ask if a man has any right to speak of alliances and of respect for treaties who, representing with far less genius but with equal indifference to moral considerations, the traditions of Frederick the Great and Prince Bismarck, has dared to proclaim that necessity knows no law and has consented to his country's trampling under foot, burning and burying in the depths of the ocean every document and every civilized practice of public internal law." Signor Salandra, however, proves with the help of incontestable facts and unanswerable reasons that Germany and not Italy was really responsible for the break up of the Triple Alliance.

XIII. SIXTY AMERICAN OPINIONS. WAR. *Pp. 105. Price on sailing. Fisher Union.*

The title indicates the nature of the contents. The opinion of Dr. Morton Prince, the famous psychologist, may be quoted as typical:—"From the American viewpoint we are forced, however unwillingly, to the conclusion that Germany must be regarded in war as the enemy of civilization and in peace as the enemy of democracy."

XIV. THE AMERICAN VS. THE GERMAN VIEW OF THE WAR. *By Dr. Morton Prince. Pp. 48. One shilling. Fisher Union.*

In this interesting pamphlet Dr. Prince gives his reasons for refusing his sympathy to Germany in the present war. "We care nothing," he says in the course of an eloquent and impressive passage, "for the 'necessities of war' . . . we care nothing for fine spun specious arguments as to why Germany was not to blame for the invasion of Belgium. We see only a peaceful unoffending nation defending her inalienable rights to her own soil. And we see the inhabitants for this offence shot down and their houses one by one put to the torch. We see tens of thousand of homes desolate . . . and all this, mind you, not as unavoidable accident from the

shelling of the enemy in battle but deliberately and systematically and unnecessarily after the capture and occupation of the city, for the sole purpose of revenge, as officially proclaimed and officially justified."

The history of Alsace-Lorraine provides us with a concrete example of the German policy of "rightfulness" in time of peace. The German rule in these provinces has throughout been characterised by systematic cruelty towards unoffending citizens. Maitre Helmer, the author of this pamphlet, is a most desirable guide in studying the history of the German rule in Alsace. Besides being an Alsatian by birth he is himself a victim of the German policy. A prominent worker in the cause of Alsatian Reunion with France, he has always been a thorn in the eyes of German officials. At the moment when the war broke out, the authorities were collecting evidence against him with a view to prosecuting him for high treason. He succeeded, however, in getting away into France two days before his mobilisation.

XV. THE TRUTH ABOUT THE WAR. *By Arturo J. Patricola. One shilling. Pp. 17. Fisher Union.*

The author, who is a Spaniard, discusses the origin and aspects of the European conflict and exhorts his countrymen "to take to heart these recent lessons of experience." "We have," he says, "very little in common with Germany and we are of small importance to her. Let us, however, be careful that at some distant day we do not stand in her path or our treatment may be the drastic one meted out to Belgium!"

G. S. MONGIA.

THE FOURTEENTH ANNUAL REPORT OF THE RAMKRISHNA MISSION SEVASRAM, Kankhal, Hardwar, for the year 1914-15. *Edited by Swami Sachchidananda, Secretary to the Ramkrishna Mission, Belur Math.*

The report summarises the activities of the Mission in its Service Home at Kankhal I. P. The total number of persons who were treated in the Sevasram outdoor hospital were 9141 and included men and women of all denominations. The Ashram also maintains an indoor hospital in which 211 persons were admitted during the year under review. A cholera ward was built last year, but the home needs a new outdoor dispensary and a general ward for non-Sannyasi patients. We all know what splendid work the mission has been doing in connection with the flood and famine relief in various parts of the country and we heartily commend this appeal for funds to the public. The report amply repays perusal and shows how accounts of public money should be rendered.

THE MESSAGE OF SWAMI VIVEKANANDA a lecture delivered at the 53rd birthday celebration of the Swami at the Ramkrishna Home, Mylapore, Madras, by K. S. Rama Sastri B. A., B.L. (Pravina Thiru). Published by the Ramkrishna Math, Mylapore, Madras.

This booklet of 52 pages gives a short summary of the teachings of Swami Vivekananda together with the author's reflections thereon. The teachings of the Swami have worked a great change in the educated mind of India and are destined to exert a greater influence in the future. The Swami's ideas on such current questions as the elevation of the depressed classes, widow remarriage, the National University should be constantly kept before our mind.

Publications of the nature of the booklet under review deserve every encouragement.

The printing is good and I could detect no typographical errors.

ALFRED THE GREAT, *presented by the Christian Literature Society for India*, pp. 12, price 6 annas.

GLADSTONE : *presented by the Christian Literature Society for India*, pp. 12, price 6 annas.

The object of these and similar volumes of the Anna Library is to popularise the lives of the world's great men to Indian readers. It is not clear, however, as to what class of readers they are meant for. If for boys, the language should have been simpler and the arrangement of facts should have been such as to make the whole read like a connected story. As it is, in many places the presentation of the story is bald and presupposes previous knowledge in the reader. There is however a great need for such cheap publications in India and the Christian Literature Society is doing a real service by publishing these volumes. Every school boy should have them in his library. The books are illustrated and the typography is excellent.

SIR SANKAR NAIK, *M.A., C. I. E., a sketch of his life and career*, Published by the Mahabharatana Education Co. pp. 4, price 4 annas.

This is a short sketch of the life of the Education Member. The brochure has no striking feature but the story of the life of Sir Sankaran is plainly recounted. There is an appendix containing extracts from his contributions to English periodicals. The printing is the average of Indian printing but it is not free from typographical errors.

B

HOW TO CHECK DIABETES MELLITUS, *By Hamed Ali Khan, B.A., B.L., T. and E. Hon. Secy. for distribution*.

The fact that Mr. Hamed Ali Khan's book has reached a third edition, is a sufficient tribute to its value. The book is a most interesting and valuable work on the disease. It seems to be valuable for those who are subject to the disease. The author, though a layman, has dealt with the subject scientifically. The part of the book which deals with the uses of indigenous drugs is very interesting.

PREVENTION OF SMALLPOX, *By Chandra Bose M. B. B. Sc. S. Chemical Examiner to the Government of Bengal for free distribution*.

Last year when smallpox was raging in the city, causing a sort of panic in the minds of the people, Rai Bahadur Chuni Lal Bose read a paper on the prevention of smallpox at the V. M. C. A. Hall under the presidency of Major R. P. Willson F. R. C. S., I.M.S., Superintendent, Campbell Medical School. The present work is a reprint of that lecture for free distribution.

In this brochure Dr. Bose after describing the nature and symptoms of the disease as briefly as possible deals more elaborately with the prevention of the disease. Any one who cares to read this pamphlet is bound to be assured in his mind that the first and foremost preventive measure is vaccination and vaccination only. We wish this pamphlet a wide circulation.

THE PLAGUE, *By Gaganendranath Tagore, M. B. B. Sc. I. M. L. R. C. S. C. I. Surgeon, Secy., Proctor annas*.

This is a small pamphlet on Plague. The object of the writer is to remove misconception regarding this

fatal scourge from the public mind. The author does not claim any originality; he has simply put down the facts as discussed by others, leaving aside all controversial matter and laying stress on things which are useful and practical. We have no doubt in our mind, if the sound advice given by Dr. Hingarani be carefully followed, there is every chance of plague being stamped out in the near future.

MOSQUITOES AND MALARIA, *By N. C. Shah, I. M. & Sc. Lecturer Surgeon*.

This booklet is a reprint of a paper read by Dr. Shah before the Kuthiawar Medical Society, Rajkot.

In these few pages Dr. Shah has made an attempt to describe the characters and habits of the mosquitoes, the mode of infection of Malaria, its symptoms, and its treatment and prevention. The language of the book is simple—not difficult for a layman to understand. One who likes to have some knowledge of Malaria, may read this pamphlet with profit.

THE NEW HEALTH BOOK *Or How to Live to 100 years*, By Sarat Chandra Ghosh, M. B. B. C. E. Price Rs. 1/6.

Throughout these pages, the author has attempted to present before the public the principles of health and the practices pertaining to it. We are glad to say that the author has not failed in his attempt. The book is an instructive one. The parts treating of physical culture, the importance of pure air, sunlight and ventilation of houses and of fasting are very nicely written.

FIRST AID IN ACCIDENTS, *By U. Kanta Rai, Price Rs. 1/6*.

The fact that Surgeon General W. B. Bannerman M.D., C.S.I., D.Sc., K.H.P., has written a foreword to this small book is a sufficient guarantee of its usefulness. After an introductory chapter on the importance of the subject, the structure of the body, bandages, fractures, dislocations, sprains, haemorrhages, wounds, burns, etc., are discussed. There is also an important chapter on ambulance transport and stretcher-drill. The pictures are very numerous—a very commendable feature in such a work. The book will be useful both to Ambulance students and the public.

JNANENDRA NARAYAN Bagchi.

SHRI SHANKARACHARYA AND HIS KAMAKOTI PEETHA, *by N. K. Venkatesan, M. A., Asst. Lecturer in English, Govt. College, Kumbhakonam, Pp. 35*.

The booklet contains a brief legendary life of Shankaracharya compiled chiefly from the Puranas and other similar works and gives a short history of his Kamakoti Peetha at Conjeevaram, which according to the author was designed by him to be the Central Seat for India. Besides, it presents the sketches of the lives of his distinguished disciples who succeeded after him to the Peetha. It is generally believed that the date of Shankaracharya can in no way be placed before the 8th century A. D., but Mr. Venkatesan holds that the traditional date as found in the Puranas, i.e., the year 2593 of Kaliyuga or 509 B. C. is quite right and is also supported by the lineage of teachers and disciples preserved in different Muttis. His arguments deserve to be examined.

VIDYUSHEKHARA BHATTACHARYA

PHYSICAL EFFECTS OF SOME INTOXICATING DRUGS
by Rai Bahadur Dr. Chandra Bha. I.S.O., M.B., B.S.,
Off. : Chemical Examiner, Bengal.

It is a small pamphlet of 21 pages. It contains in an abridged form in clear and simple language all about the evil effects of alcohol, opium, cocaine, Indian hemp and tobacco—the intoxicating drugs most commonly used by the people of this country.

In his preface the author says :—

"At the outset, I should tell you as a medical man, that none of these drugs is necessary for the human body in conditions of health, but they perhaps with the exception of tobacco, are valuable medicinal agents and are indispensable to the physician in the treatment of certain diseases. I am, myself a teetotaler and have the greatest aversion against the use of any of these drugs except as medicine. It must not, however, be supposed that this aversion is the result of any ill founded prejudice against these intoxicants. It is a conviction based on my long experience as a medical man, as a chemical examiner and also, as a member of community. There are many who hold that moderate doses of any of these intoxicants specially alcohol and opium, do not produce any ill effect on the system. But even those that hold this view are constrained to admit that it is very difficult to keep to a moderate dose for any length of time, because one of the physiological properties of these drugs is to induce a craving for increased doses. Many a sad case are known in which the habit of drinking or opium taking began with small doses only, often under medical advice, but which continually went on increasing till the sorrowful end came in with the termination of a valuable life or the incarceration of the victim in a lunatic asylum."

He has dealt with each drug separately and has given the action of these intoxicants on the human mind and different organs of the body and has shown very clearly that the habit of taking these drugs saps the moral fibre of their devotees so that they become moral wrecks and scourges to society.

It is a very deplorable fact that in India the use of cocaine is increasing very rapidly inspite of the vigilance of the Excise Department. The figures collated from the annual reports of the Chemical Examiners to the Government of Bengal for the last seven years given in this book show that in the year 1908, 125 samples of cocaine were seized and sent for examination whereas in 1913 the number went up as high as 4875. This shows how rapidly the contagion has spread in Bengal—I think in other parts of India too. The learned author rightly observes : "Considered sociologically, it is perhaps safe to say that a considerable portion of the crimes committed in this city (Calcutta) may be traced to the utter moral depravity which follows the habitual use of cocaine."

Every well-wisher of society should possess a copy of this pamphlet and try to check the mischief by explaining to the public the grave consequences that follow the use of these drugs. This book ought to be translated into all the vernaculars of India and the local governments should distribute them broadcast.

S. B.

OUTLINES OF MORAL PHILOSOPHY by Bala Bhoykumar Maumtu, M. A. Senior Professor of Philosophy, Krishnath College, Barhampur. Price Rs. 3-8.

The author writes, "this text in ethics is intended specially for meeting the wants of the students preparing for the B. A. Examination in ethics for the Calcutta University" and he also tells us why he has written this book—"As a teacher of Philosophy for over eighteen years, I have always found the students of my classes in helpless condition. For a long time, therefore, I have been feeling the need of such suitable books as will give them considerable relief and at the same time, much assistance." And "writing from the standpoint of *Ideal-realism* as expounded by Vedantism and Hegelianism I have accepted the view that the real standpoint of morality should be that which takes into account and explains all the sides of human nature and is, therefore, the perfection of nature; I have, consequently, tried to show that all other forms of the moral standpoint are based on the one-sided conception of the self." There is no place for the serious review of a textbook like this. But the author will, naturally, be glad if the students feel that they have got after all a suitable book which gives them relief and much assistance and if the University authorities appoint it as a textbook.

S.

SANSKRIT.

SVADISHABDA SAMUCHCHAYA by Karmaja Anand Chandra Surj, with the comment called *Syadvadishabda-dipika* edited by Pandita Jagadish Chandra Kotha, Benares City. Pp. 645. Price Anna-10.

The author is an ancient writer belonging to the Shvetambara Sect of the Jaina community and his present work is a **विज्ञानशासन** or a treatise on Gender especially intended for the students of Hemachandra's Sanskrit grammar Siddha Hemachandra.

VIDYUSHEKHARA BHATTACHARYA.

GUJARATI

SONERISHABDO by Chandrabhawan Ishwatal Khan Sahib, Printed at the Surad Jain Printing Press, Price Rs. 0-1-0 (1916).

These are copy book maxims, printed in large type, in the form of a small copy book. It contains 66 "golden words" of advice.

CHHUPO DUL, Part I. by Abdul Kader Hasan Ali, Editor of the *Akhbar-e-Saifi*, Printed at the Badri Printing Press, Rajkot, Clothbound, pp. 100. Price Rs. 0-4-0. (1916)

These are stories of an Indian detective. They deserve mention only as they are written by a Bora Mahammadan gentleman.

RAMAYAN NO RASAMIAK SAE by Hargovind Kanti Bhatt, printed at the Union Printing Press, Ahmedabad, Paper Cover, pp. 10 Rs. 0-1-0. (1916).

As its name implies, this book gives the substance of the Ramayana in verse. As the writer of the introduction, Mr. C. N. Pandya says, the book is of the ordinary type, and possesses both faults and good points.

HIRANGADY translated by Mahadev Harichandra Das, B. A., LL. B., and Narhari Desarkhadi Parikh, B. A., LL. B. Printed at the Prayagandhu Printing Works, Ahmedabad, pp.
Price Rs. 0.50. (1910).

This is a very readable translation of the Bengali play written by Sir Rabindranath Tagore. The translators have taken special care to make it resemble the original as much as possible and have been able to preserve its spirit. The preface is, however, written in a very "high" style, and would not be understood by many.

PRAKASH SOWNDARYA, by Vanshidhar Keshavnath Dikshit, printed at the Lakshminarayana Printing Press, Baroda, Clothbound, pp. 32. With Pictures. Price 0.30. (1915).

A short essay on the beauties of Nature, animate and inanimate, prepetual song-tones as by Mr. Dikshit, of the Baroda Educational Department, is now reprinted in Devnagri characters. It certainly testifies to the love of Nature entertained by the writer, as well to his happy style in describing her beauties.

SMARANA SAMITHA, in Varsinhrao Bhogirath Doshi, B. A., C. S., printed at the Gujarati Printing Press, Bombay, Clothbound with artists cover and pictures. Pp. 70. Price Rs. 1.10. (1910).

This grand and the best elegy in Gujarati owes its origin to the sad bereavement that the poet suffered some time ago by the death of his young son. As the best exponent of lyrical poetry, Mr. Narsinhrao till now holds a high place, but this "lyric of mourning" exceeds in its beauty and pathos, all his former poems. The inspiration came from a very living source, and it has made him utter words, which surely appeal to his readers as nothing else appealed before. Human nature being what it is, a wave of sincere sympathy at once reaches out from the heart of the reader to that of the poet, who in spite of the reserve of his spiritual strength on which he falls back for support as on a rock, cannot still shake off the state of a sorrow-stricken parent. The event of a death in one's family is an ordinary incident, but it requires a poet's pen to exalt it to the pitch of the sublime and the beautiful. The ascending notes of a funeral song, and the dying, whispering wail of an autumn wind, the soothing sentiments of one who extracts comfort from a comfortless event, and the silent resignation of one who believes in the eternal goodness of things, all these one finds here. The forward by Prof. Anand Shanker Dhruva, M. A., LL. B. is in every way worthy of the poem and the writer. The history of this kind of poem is very accurately traced, while all the beauties of this particular poem are well brought out. The notes at the end are scholarly and calculated to advance the value of the work. The only drawback are the pictures, which somehow or other are not what they should have been. A few lines from one of the best gems of the poem,—a pathetic appeal by the departed Innocent Soul to his Father in Heaven, to open the doors of his temple and get him in, now that he has finished (alas! too soon) his wanderings in the Desert of Life,—are here extracted: They are so simple that any Indian can understand them.

मंगल मन्दिर खोलो, दयामय ! मंगल मन्दिर खोलो !

जीवन वन अति वेग बटाव्य, द्वार जभी शिशु भोलो ;

तिमिर गद्युं न जगति प्रकाशयो, शिशुने डरमां लो लो

दयामय ! मंगल मन्दिर खोलो !

SHRI VALMIKI KAMAYAN, *Balkand*, by Manhariram Harichorram Mehta, B. A., printed at the Jan Mander Printing Press, Ahmedabad. Pages 223. Price Rs. 1-0-0. (1910).

This is a translation into Gujarati verse of Valmiki's celebrated epic. Mr. Manhariram found the metre of the original, viz. अनुष्टुभ, unsuited to the genius of the Gujarati language, to convey the grand and heroic ideas of Valmiki; he has therefore struck out a new line, and freed himself from the restraint of any prosodial metre whatsoever, and tried the experiment of translating it into blank verse. To those who have been used for generations to the shackles as well as the sweetness of rhyme and metre, the departure appears to be rather startling and irreconcilable, but if once you come to discard those preconceived notions or inclinations, the verse, read with proper punctuation and emphasis does not sound jarring, not only that, but in several places it rises to the grandeur of the situation depicted. There are passages where one would like to halt and read them over again. We are afraid, that in spite of all these things in its favor, the book will have to make a heroic effort to be popular. The translator calls his new arrangement of words in blank verse, Ramachhand.

K. M. J.

HINDI.

KSHAYA ROGA 0 Tuberculosis. By Balkrishna Sarma. The Indian Press, Allahabad. Price 3 annas.

The present work is a Hindi translation of a Prize Essay by S. Adolphus Knop, M. D. (New York). The translation is nicely done. One who can read Hindi will gain much knowledge of the disease by reading this translation of Mr. Balkrishna Sarma. The number of cases of tuberculosis is increasing daily. It is high time for every one of us to know the nature of the disease and the means of combating it. We praise Mr. Balkrishna Sarma for this beautiful translation.

JANENDRA NARAYAN BAGCHI.

KAISA ANDHAIR by Shree Pandit Anvithan Bandyopadhyay and published by Kumar Desendra Prasad Jain at the Central Jain Publishing House, Anand, Daryabmo, pp. 77. Price as. 4.

In this novel the last part of Scott's "Ivanhoe" has been almost wholly reproduced. The writer has been very dexterous in applying the horrid descriptions at the end of Scott's novel to Indian conditions. He has chosen the cells of some of the Indian priests at places of pilgrimage, as the scenes for his descriptions, and though in some cases these may have been far-fetched and exaggerated, the author has done well to call attention to a state of things, which though practically non-existent now-a-days, was a source of terrible misery and sin formerly. The story in the book is interesting and the book will repay perusal. The language is somewhat defective and it is strange that instead of Bengali-ism, we find Angli-

REVIEWS AND NOTICES OF BOOKS

cism in some places in which Hindi has been used unidiomatically.

SHIKSHA KA ADARSHA AUR LAIKHAN-KALA by *Swami Satyadeva*, Printed at the Standard Press, Allahabad and published by the Satyagranthamala Office, Johnstongunj, Allahabad, Crown 8vo, pp. 109, Price as. 5.

We hail Swami Satyadeva after a pretty long time again. As usual, the writer has been forcible and original in his remarks. He has rightly called attention to that set of writers in Hindi who have recourse to the worst forms of plagiarism. They would advertise for MSS. books for publication and having refused them as unsuitable, would publish them again after a few months in their own names, after due curtailments and additions. The author has given very useful views on the art of writing and his criticisms have been not at all inordinate. The second part of the book consists of his views on the right form of education; and as to this he thinks that the ideal of education varies with the specific ideals of different societies. The author's views are certainly very instructive and he has enlivened the publication, as is usual with him, through the help of many of portune anecdotes, some of which are from his own personal experience.

BHARATIYA SHASHAN by *Mr. Bera*, *Mañ*
300, *Shikmahal, Meerut, Crown 8vo.*
Printed at the Sudarshan Press, Allahabad, Price

This is a nice handbook on the constitution of the Indian Government and the writer has given all that is required on the subject. His language is simple and correct and he has dealt with the subject with some care. The statistics which he has quoted in certain places would prove very useful. At the end of the book there are certain additional appendices, which give in a succinct form many very pertinent figures. The book with all this is interesting and the get-up is very nice.

MAHARAJA SCINDHIA KAI VYAKHYAN, compiled by *Mr. Kamadas Vaidya* (Hon. Secretary, Gwalior Chamber of Commerce) Gwalior and published by him, Crown 8vo, pp. 271 and 36 and 1, Price Rs. 3-8.

These are the speeches of the Maharaja Scindhia of Gwalior. There is an unmistakable ring of sincerity in these speeches, as Rao Bahadur Raoji Janardan Bhude, who has written an introductory review, rightly puts it. We can see from the speeches that the Maharaja is no less enlightened than his brother Maharatta Prince of Baroda, though he does not come so much to the fore as the latter. Even the style of the speeches is instructive and administrators and statesmen can learn much from them. The compiler has to be congratulated on this publication. His own introduction throws much side-light on the history of the Scindia family and the way in which the present scion of that family is governing his State. Several decent blocks of the Maharaja in different dresses and at different ages, increase the artistic value of the publication and there are a few other blocks as well. The get up of the book is excellent.

SHIVAMASHYAM UPANYAS by *Pandit Shankarprasad Misra*, Printed and published by the Anglo-Oriental Press, Lucknow, Crown 8vo, pp. 76—as. 5.

This is a very instructive novel and its plot is not bad. The evil effects of want of female education have been graphically shown in it. Certain chapters are devoted to the foolish eagerness of females for or-

naments due to ill education. The author has sometimes gone to details and considering the other aspects of the novel, this seems to have marred a little the symmetry of the novel. The novel has ended very happily and feelingly and there is a great deal that can be learnt from the whole of it. We must welcome the increase in number of such really useful publications.

MAIWAR GATHA by *Panditya Lochan Prasad*, Published by *Mr. Haridas Vaidya* at the Narsingh Press, 201, Harrison Road, Calcutta, Crown 8vo, pp. 78—as. 4.

The author has given in this publication in a very touching manner some stories in poetical form from the history of Maiwar. No doubt these redound to the grandeur of mediæval India. The language and style of the author are excellent, and have added to the worth of the publication. We are very glad that the author is rising in the estimation of the Hindi world through his publications which are getting better day by day. The get-up of the book, as of other books published by the enterprising publisher Shree Haridas Vaidya, is highly satisfactory, and we must commend his zeal as well, for imitation on the part of other publishers.

ANAND KI TOKNI by *and published by*
and published by, Crown 8vo, 26—as.

This book has in the main been written on the same lines as "Chowbey ka Chittha" which we reviewed some time ago, though some of its articles, of which there are fifty two, are translations from "Folk Tales of Bengal." A few are highly interesting and artistic, and there is none which will not repay perusal both for its style and interesting elements. The Hindi Literature can very well see a few more additions to books of this nature, which is certainly novel in the language. We need hardly say that the get up of the book is excellent.

BHARAT-SHASANPADDHATI by *Pandit Radhakrishna Jha, M. A., B. L., Lecturer, Patna College*, Published by the Khadga-vilas Press, Bankipur, Demy 8vo, pp. 316. Price bound edition—Rs. 2, ordinary edition—Rs. 1-12-0.

This may be said to be a history of the constitution of the Indian administration if at all it has got any continuous and consistent history. The title of the book may accordingly be misleading as to its contents. In what the author has written he must be said to have sufficiently been painstaking and researchful; and at any rate a systematic attempt at writing about the constitution of our administration cannot but be said to have removed a long felt want. The few other small books on the subject, though more exhaustive containing in some instances even more detailed information, cannot be said to be historical. The printing and get up of the book are nice and the language satisfactory.

PRIVAPRAYAS by *Pandit Ayodhya Singh Upadhyay*, Published by the Khadga-vilas Press, Bankipur, Demy 8vo, pp. 53 and 255—Rs. 1-8-0.

The subject of the book is "Shree Krishna" on whom the poets in the Braj language are never tired of writing. The poem under review is certainly a grand production and may be said to mark an epoch in the history of Hindi poetry. The introduction of the author is also masterly. But though he has followed the example of certain other Hindi writers, it must be said that he has deviated considerably from the theme which he should have pursued. The author is an well-known writer in Hindi, and though he is not a voluminous writer, what he has written has been

very valuable. We commend his style, which though not simple is suited best to his subject. The book is nicely bound-up and the get up is very satisfactory.

M. S.

MATHEMATICS.

ALGEBRAICAL EXERCISES WITH SOLUTIONS. By Sarat Chandra Mukerjee, M.A., B.L., Emeritus Professor of Mathematics, Canning College, Lucknow, Third Edition, Revised and Enlarged, 1916, Price Re. 1-4.

After a distinguished career Babu Sarat Chandra Mukerjee has retired from the professor's chair in Canning College, Lucknow, which he so worthily filled. In our school-days, and those of our elders, his "Algebraical Solutions" was known in school-boy parlance as "Sarat Chandra's Solutions." It was a very popular manual, and enabled many a boy who had no special aptitude for mathematics to learn algebra. It is meant for matriculation candidates, and in the present edition has been brought thoroughly up to date, meeting the requirements of the present-day syllabus of the Indian Universities. The author says: "After having gone through two editions, which were well received by both teachers and students, the book lay out of print for nearly two decades owing to the author having lost interest in it under stress of several sad circumstances." We hope

the present edition will be as well received by both teachers and students as the two previous ones.

C.

A REVIEW REVIEWED.

A criticism of my *Prosody and Rhetoric* by Mr. Dharendra Nath Choudhury in your March number has been brought to my notice. The writer has spared no pains in picking out some definitions and illustrations from my book to show that I have borrowed from Mr. K. Bose's *Rhetoric and Prosody*. He seems to forget that books on the same subject are bound to contain similar definitions and sometimes the same stock illustrations. He is apparently unaware that many of Mr. Bose's definitions and illustrations are also to be found in the treatises of Bain, Hiley, Nesfield and others. I am sorry that he is blind to the general arrangement and logical order of my book which are entirely different from those of Mr. Bose's. The latest ideas set forth by me have evidently escaped his notice. Copies of my *Prosody and Rhetoric* are kept in all college libraries in Bengal, and I openly invite professors and students to compare my book with Mr. Bose's and judge for themselves whether or not my method of treatment is original.

ROBY DATTA

APPLIED HISTORY

THIS is just a line to say how I enjoyed reading Prof. Jadunath Sarkar's "Confessions of a History Teacher" in the December Modern Review. Being a student of Political Science I can not presume to say much on the subject of history; but these two branches of learning are, after all, very closely related to each other. Indeed, the English historian James Freeman has declared that "history is past politics and politics is present history."

Mr. Sarkar is nothing if he is not interesting and refreshing. He is so, because he seems to pour his very life into everything he takes up. I wish I could persuade every Indian college professor to read his "Confessions."

There is, however, one point that I would be glad if Mr. Sarkar had stressed a little more fully. It is, of course, important that the students in India should learn the scientific methods of investigation; but is it not equally important that their teachers also should keep up the habit of research? Is it not true that they too frequently neglect this habit or let it slip into the background? In my own Univer-

sity here in Iowa, we instructors know quite well that there is not much chance of "getting a raise" if we do not occasionally produce something which will give "evidence of original research."

At the beginning of the University year, my chief, Prof. Benjamin F. Shambaugh, a name highly honored among the Political Scientists of America, called the instructors of his department in a conference and said: "In all of our efforts at this University we are striving to make our country a better place to live in. We are not here primarily to discuss political theories, but to turn our attention to the past and to exploit it in the interest of the living present. As members of the instructional staff, it is our duty to furnish trained experts whose services are so necessary in public administration." Can a teacher have a loftier ideal than this? The more I teach the more I feel that the young men and women who attend my classes ought to realize that knowledge should seek justification in its practical application. The facts of physical science, of literature, of history, of polity are not in themselves of highest value apart from their service

to humanity. We do not perhaps need to spend much time on the study, let us say, of history for its own sake. It seems to me that what we need most at this stage of our development in India is Applied History, which, as my chief would explain, regards the past as a social laboratory in which experiments in politics and human welfare are being tested daily. It is the mission of the history teacher to apply the results of these experiments to real present-day conditions, to real life. I may be accused in India of being an utilitarian; but as a result of my constant contact with healthy-minded, practical, common-sense people I am convinced that the chief end of studying the Social Sciences—and history is one of them—is to interrogate the past in the light of the actual

conditions of the present, to find the finger-posts to human betterment, and to outline a rational program of progress in legislation, administration, and social welfare.

Moreover, being a strong believer in organization, I would like to see the progressive teachers of India organize a national teacher's association to advance the interests of the teaching profession. Why would it not be a good plan for Indian college professors to get together once a year and exchange views on subjects of common interest? What does Professor Jadunath Sarkar say?

SUDHINDRA BOSE, M.A., PH. D.
Lecturer in Political Science
State University of Iowa:

Iowa City, U. S. A.
January, 1916.

THE ANDHRA MOVEMENT

THE Andhra Movement, to start rather abruptly, is the most mis-represented, the most mis-understood and the most mis-judged of all the movements that had their origin in India. It may not, perhaps, be irrelevant to quote a few words from the "admirable" address of Mr. George Yule delivered from the presidential chair of the Indian National Congress:—

"All movements of the kind in which we are concerned pass through several phases as they run their course. The first is one of ridicule. That is followed, as the movement progresses, by one of abuse, which is usually succeeded by partial concession, and by misapprehension of aim, accompanied by warnings against taking "big jumps into the unknown." The final stage of all is a substantial adoption of the object of the movement with some expression of surprise that it was not adopted before. These various phases overlap each other, but between the first and the last the distinction is complete."

The movement has made such good progress that it may be said to have survived the first two stages. Partial concessions seem to be within sight, not of course without a misapprehension of aim that a disruptive process is set in motion before the unifying process is complete, that things which demand more immediate attention suffer neglect, that national energies are unnecessarily frittered away, so on and so forth. We are quite confident

however that the underlying federal principle so admirably suited to the political needs of India will ere long receive due recognition at the hands of the Government and the people as well.

The movement has a good historical background. The causes that have been at work are varied and complex, and it is a sad mistake indeed to attach undue importance to any particular factor thereof. It is due from me however to confess that indiscreet and I might add immoderate advocacy have not a little contributed to the volume of misrepresentation and misinterpretation that so quickly encircled the clear and unmistakable principles underlying the movement. Stripping it of the popular notion, I propose to trace briefly its historical continuity and evolution and endeavour to point out that the movement is not a by-product of the imagination of the youthful and unemployed idealists but one which suggests the necessity for, and the ways and means of, readjusting the territories of India on known ethnic and scientific principles and thus helping the formation of the Indian nation on better and surer foundations.

The Andhra Movement, if I am excused for an assertion which precedes demonstration, is a national or if you please, a sub-

national movement, a movement which strengthens, if it does not for the first time suggest, the idea of a federated India—the only desirable, if not the only possible, solution of the Indian national problem. I must, in this connection, warmly protest against the assertion made in certain quarters that the movement is purely sectional and is at bottom concerned with striving after a few more loaves and fishes for the Telugu folk, and its comparison with the Muhammadan separatist movement is the most unkindest of all. I do not deal with the Andhra University and other local grievances here as they are automatically removed by the grant of a separate province; and I therefore confine myself with the question of the province and the political principles it involves.

A slight digression into regions of political science ought to be permitted as some ideas of Nationalism and Federalism are helpful for a fuller appreciation of the Andhra Movement. Nationalism was the dominant note that regulated the political life and conduct of the 19th century—a fact fully illustrated by the struggle of the European Nations in the last century to assert and maintain their national existence against the aggressive attacks of their stronger neighbours. The slightest ethnic variations were deemed sufficient for the formation of separate nationalities. Napoleon and Metternick were the sworn foes of nationalism, and considerations of national unity were responsible for the Napoleonic and the Italian wars. The ruthless partition of Poland evoked the righteous indignation of Burke, and Lord Acton writes with a glow of sincerity—"There was a nation demanding to be united into a state—a soul, as it were, wandering in search of a body, a disembodied spirit crying for vengeance." The case of Ireland is, as we all know, a matter of past history and present politics. The doctrine of "National" states which loomed so large in the political horizon of the last century was found to be rather defective; and it was discovered that smaller nations grouped together on a federal basis will make for the lasting peace and solidarity of the world. Harmony and unity can then be worked out of the local diversities and sturdy local independence is proved not incompatible with a larger patriotism which a federation implies. There was almost a superstitious belief sometime ago

that local patriotism is a bar to national progress; and stupid attempts were made to put them down by wholesale persecutions in the 17th and 18th centuries. Nor is it necessary for me to remind you of the exploded doctrine of political science which became crystallised a quarter of a century back into the reactionary opposition of Anglo-India against the Indian National Congress. I mean the doctrine which lays down common language, common religion, common interests and common history as indispensable pre-requisites of Nationality. A glance at the federal constitution of Germany, Switzerland, the United States of America and Australia is instructive as it shows how harmony is worked out of not merely diversity but even of conflict of interests. Just as nationalism was the feature of the 19th century, federalism may be said to be an idea which has very visibly affected the current of political thought of the twentieth century. Lord Tennyson was the true poet of federalism and his "Parliament of man and federation of the world" opens up a glorious vista of the political future of the world. Federalism is the message of the twentieth century awaiting fulfilment and demonstrates to the world that "22 independent states each having its distinctive manners, customs, institutions and laws" could peacefully settle themselves into the nation of Switzerland; that Austria-Hungary could be a political State in spite of 28 languages; that Germany could be evolved out of several independent kingdoms; and that the English, the French and the German elements can peacefully settle their local and national affairs in the Grand Assemblies of the United States of America. The component parts of the British Empire—Australia and Canada and the Union of South Africa—worked out their political salvation on federal lines; while England the motherland has been getting on in its own, crude and primitive way with a Parliament which can authorise a tramway for Nottingham, legislate for the liberation of slaves in the British Empire, grant Self-government to the Union of South Africa; and in the same sessions can amend the Indian High Courts Act or the Land Transfer Act. Thanks to the spirited and patriotic agitation of the Irish people for over a century, the English nation was awakened to the urgent necessity of solving the Irish question. Mr. Asquith with

his characteristic political sagacity discovered that the Irish Home Rule Scheme is but a part of a bigger "devolution all round" and that the federal re-adjustment of the local Governments of England, Wales, Scotland and Ireland is the only true solution of the Irish question. The British Isles, Canada, Australia, New Zealand, South Africa, and ere long India, will be self-governing members of a huge federation with a truly imperial parliament concerned only with truly imperial affairs.

Before, however, India takes her place as an independent and respected member of the British Empire, she has to solve her own national problem. We shall presently see which of the three great possibilities of the Indian Nation is the most practicable, the most desirable and the most conducive to the efficiency of the local self-government without at once impairing the vitality of the Indian Nation. The three possibilities in the making of the Indian Nation are, firstly, a federation of the United States of India based on known ethnic and linguistic principles; secondly, the destruction at one stroke of differences in race, language, manners and customs, and the manufacture of the Indian Nation straightway; and thirdly, the preservation of the present order of things which means again the perpetuation of an arrangement of territories made by Lord Clive and Warren Hastings who had no higher consideration in jumbling together the Indian Provinces than those of political expediency, conquest and annexation. A portion of China, if conquered and annexed, would have been designated a portion of the Indian Empire as the annexed portion of Burma was so considered against our united protests. There cannot be any limit to official vagaries and official considerations when a G. O. could place Zanzibar of Africa and Aden of Arabia under the jurisdiction of the Bombay Presidency. If Austin were to be living then, and revising his Jurisprudence, he would have borrowed this G. O. as a choice illustration of the omnipotence of the positive law which he expounded at length. The Ceded Districts, the Northern Circars, the 24 Parganas, the Central Provinces, are names still reminiscent of confusion and chaos out of which the present arrangement of territories came into existence. The second possibility is not seriously contended by

any, although it ought to logically follow from the rejection of the first. The choice, I may safely conclude, lies between the United States of India and the preservation of the status quo.

I shall endeavour to point out from the utterances of our Indian politicians and the English statesmen how our ideas about the Indian Nationalism have been surely, though imperceptibly, tending towards the federal idea. Our political ideas were just emerging out of a nebulous state in the early beginnings of the Congress. It was generally recognised by our leaders then that the nationalising forces have been at work, and the work of our leaders chiefly consisted in repulsing hostile attacks. Mr. W. C. Bonnerjee, as the President of the first sessions of the Indian National Congress, talks of "the eradication, by direct friendly personal intercourse, of all possible race, creed or provincial prejudices." Mr. Badruddin Tyabji talks of the unity of different communities. Wedderburn and Yule elaborate on the representative government and the revival of national life in necessarily vague terms. It is Mr. P. Anandachari that devotes greater attention in his presidential address to the question of Indian Nationality and meets the arguments of our friends the enemies by an admirable force of logic:—

"To detract from the worth and significance of the well knit, ever expanding phalanx known as the Indian National Congress, a desultory controversy was raised round the word *Nationality*—a controversy at once learned and unlearned, ingenious and stupid, etymological and ethnological. Now a common religion was put forward as the differential, now a common language, now a proved or provable common extraction, and now the presence of the privileges of commensality and inter-communal kinship. These ill-considered and ill-intentioned hypotheses have one and all fallen to the ground, and no wonder for the evident circumstance was lost sight of, that words might have diverse acceptations—each most appropriate for one purpose and in a like degree inappropriate for other purposes. In my view, the word nationality should be taken to have the same meaning as the Sanskrit *Prajah* which is a correlative of the term *Rajah*—the ruling power. Though like the term *prajah*, it may have various significations, it has but one obvious and unmistakable meaning in political language, viz., the aggregate of those that are citizens of one country, subordinate to one power, subject to one supreme legislature, taxed by one authority, influenced for weal and woe, by one system of administration, urged by like impulses to secure like rights and to be relieved of like burdens. Affirm this standard and you have an Indian nation. Deny it and you have a nation *nowhere* on the face of the earth."

Mr. Dadabhai Nowroji later on foreshadowed the colonial self-government

ideal developed and perfected by the Allahabad Convention of 1908. In 1904 Sir Henry Cotton, the President of the Bombay sessions of the Congress, made an important and weighty pronouncement characterised by a clearness of political vision and prophetic insight. I make no apology in quoting it at length:—

"Autonomy is the key note of England's true relations with her great colonies. It is the key-note also of India's destiny. It is more than this, it is the destiny of the world. The tendency of empire in the civilized world is in the direction of compact autonomous states which are federated together and attached by common motives and self-interest to a central power.....The ideal of an Indian patriot is the establishment of a federation of free and separate states, the United States of India, placed on a fraternal footing with the self-governing colonies, each with its own local autonomy cemented together under the aegis of Great Britain. That is a forecast of a future, dim and distant though it be, the gradual realisation of which it is the privilege of Government to regulate, and the aim and hope and aspiration of people to attain.

"This is our ideal of India's future. The process of reconstruction should be always before our eyes. Changes may, and should, be gradual, but they must come, and we should prepare ourselves for their realisation. Statesmanship consists in fore seeing, and we are all of us the better for the exercise of fore thought. Familiarise yourselves, therefore, with a conception of India's future, which gathers as it grows, and insensibly attracts into the political evolution all other great problems of economic and social reforms which are awaiting solution."

The ideal of the United States of India, which, according to Sir Henry Cotton, ought to be the aim of every patriotic Indian, was invested with the dignity of official recognition in the historic despatch of the Government of India 1911:—

"It is certain that, in the course of time, the just demands of Indians for a larger share in the government of the country will have to be satisfied and the question will be how this devolution of power can be conceded without impairing the supreme authority of the Governor General in Council. The only possible solution of the difficulty would appear to be gradually to give the Provinces a larger measure of self-government until at last India would consist of a number of administrations, autonomous in all provincial affairs, with the Government of India above them all, and possessing power to interfere in case of misgovernment, but ordinarily restricting their functions to matters of Imperial concern. In order that this consummation may be attained, it is essential that the supreme government should not be associated with any particular provincial government. The removal of the Government of India from Calcutta is therefore a measure which will, in our opinion, materially facilitate the growth of local self-government on sound and safe lines. It is generally recognised that the capital of a great central government should be separate and independent, and effect has been given to this principle in the United States, Canada, and Australia."

Elsewhere in the same despatch, it is said—

"We are satisfied that it is in the highest degree desirable to give the Hindi speaking people, now included in the province of Bengal, a separate administration. These people have hitherto been unequally yoked with the Bengalees and have never therefore had a fair opportunity for development. The cry of Behar for the Beharees has frequently been raised in connection with the conferment of appointments, an excessive number of offices in Behar having been held by the Bengalees. The Beharees have long desired separation from Bengal. There has been, moreover, a very marked awakening in Behar in recent years, and a strong belief has grown up among the Beharees, that Behar will never develop until dissociated from Bengal. That belief will, unless a remedy be found, give rise to agitation in the near future, and the present is an admirable opportunity to carry out on our initiative a thoroughly sound and much desired change."

May I express the fervent hope that the day is not far distant when the Viceroy of India will have to make a similar pronouncement on the formation of the Andhra Province? Every nation consists of communities in varying stages of progress and their indiscriminate jumble always retards the growth of less developed communities. An historical investigation shows it to be a mere truism.
